
TYPICAL AMERICAN TWIN-CYLINDER MACHINES.

The top illustrations show the 1915 model Excelsior and the twin-cylinder De Luxe engine with enclosed inlet valves. The lower illustrations show the latest Harley-Davidson fitted with Remy electric lighting installation, and the new Yale.

country, while front wheel stands in America are looked on almost as freaks, and the makers who fit them can probably be counted on the fingers of one hand. Mudguarding leaves much to be desired. Another instance of what would here be considered almost criminal design is the fact that in many even of the most popular makes the whole engine has to be removed from the frame to get a cylinder off for cleaning purposes. Automatic carburetters are as common in the States as the two-lever type in England, and sprung saddle pillars are very common.

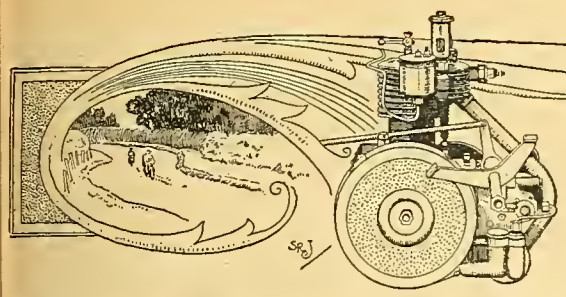
Electric Lighting Installations.

The chain-driven Merkel has a two-speed epicyclic gear on the countershaft. The 1915 Dayton has a detachable oil tank, dropped into a rectangular well in the petrol tank. The Remy Electric Co. share the Splitdorf Co.'s belief in a combined magneto-cum-dynamo-lighting installation, but have arranged their system so that if the battery should become completely destroyed, the dynamo can be used to "excite" the magneto. The head lamp provided with the apparatus has two bulbs—a high candle-power bulb in the centre of the reflector, and a less powerful bulb near the top of the reflector; the latter is used wherever brilliant head lamps are prohibited or unnecessary; *e.g.*, it would be useful when the machine is left standing by the roadside. The new Harley-Davidson sidecar has a telescopic wheelbase, so that the track ("tread," as its makers phrase it) can be adjusted to suit the gap between the ruts on country roads.

An American company is going to manufacture Auto-wheels under licence. An Ohio rider has patented a new rough weather windshield, which looks like the longitudinal section of a hen's egg, the thin end being split, and terminating at the front hub, whilst the fat end protects the rider's person. It is made of mohair (*i.e.*, black Cape cart hood fabric) attached to a light steel framework by turnbuttons and brass eyelets, and is provided with a moon-shaped mica window in the bulge of the egg. Shall we see one in the next Boxing Day 24 hours rides?

Forged head lug of the American Excelsior.

Probably the most striking comparison between British and American machines is that while we are trying to turn out a light machine that will go anywhere and withstand hard work, the Americans continue to pile on weight and use huge engines, with the consequence of heavy gears, frames, large tanks and heavy fittings. The result is usually a cumbersome and unwieldy mount. There is one notable exception to this generality, and that is the Indian, the makers of which, in accordance with British ideas, are marketing 3½ h.p. and 5 h.p. twins, the latter built on the lines of the excellent little machine raced in the T.T. Perhaps now that three-speed gears are coming along, the lighter and handier type of machine will become more popular in the States. American two-strokes are represented by the Schickel, a large machine with a 6 h.p. single-cylinder engine, a three-speed countershaft gear, and chain drive throughout, and the only British mount in the Chicago Show was a solitary specimen of the two-stroke Triumph, staged by the agents for the Coventry Chain.



WHY AN ENGINE KONKS.

By E. WATCHORN.

SOONER or later in the life of an internal combustion engine, whether of the gas, oil, or petrol type, there will be heard issuing from the engine a harsh metallic hammering when the engine is opened out when labouring under a heavy load. This noise is known to the motor cyclist as konking, to the motorist as pinking, and to the gas engineer as piston tapping. It is sometimes known as knocking, but this term is wrong, as knocking is really the correct term for the sound given out by a loose big or little end.

Now there are several questions to consider.

What causes this noise?

Why are some types of engines practically immune from it?

Why (assuming the ignition is correctly set) is this noise only heard from a dirty engine?

The Cause of the Noise.

Now as regards the first question, this noise is caused by the piston being violently blown from one side of the cylinder to the other by the rush of the explosive gases. It is difficult, considering that the piston clearance has only a few thousandths' play, to see how the piston can gain such a momentum, the arresting of which gives off such a sound, but it must be noted that the blow given to the piston, although delivered at an angle, is of terrific violence, the initial pressure of the gas being about 300 lb. to the square inch.

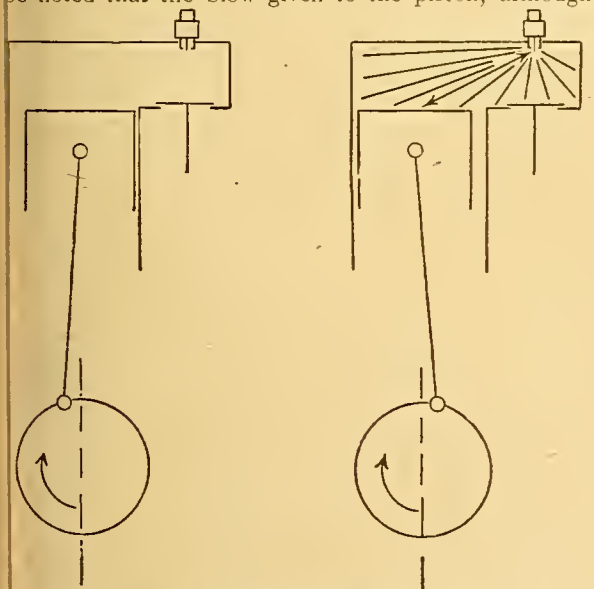


Fig. 1.—An engine with a Γ-headed cylinder nearing the end of the compression stroke.

Fig. 2.—The same engine commencing the firing stroke.

N.B.—For the sake of clearness the pistons are shown with a large clearance.

The following diagrams will readily show how the action of the gases in a standard Γ-headed cylinder cause the blow.

The Why and Wherefore.

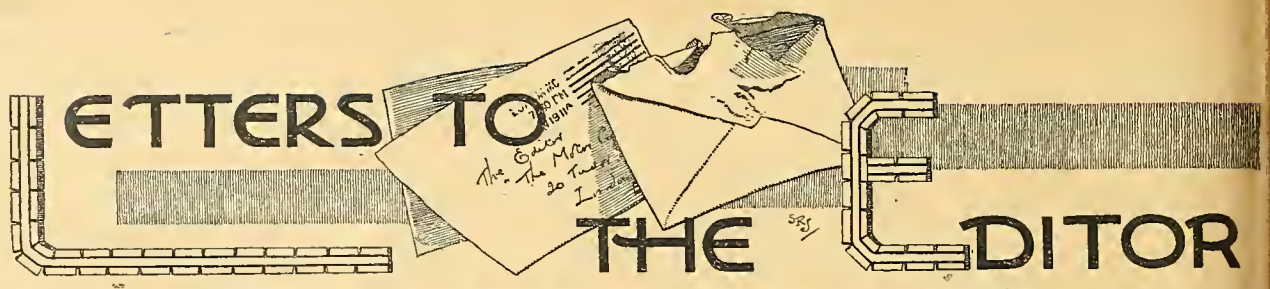
Diagram 1 shows the piston on the finish of the compression stroke It will be clearly seen that, owing to the angularity of the connecting rod, the piston is forced on to the valve side.

Diagram 2 shows the beginning of the firing stroke. Now, it is well known that the firing of a mass of gas is not instantaneous, but occupies time, hence the use of a variable ignition control. It will clearly be seen from the diagram that the gas ignites first in the valve chamber, then rushes across the piston top into the cylinder. Now, if the piston is too high up in the cylinder when the gas is fired, either through the ignition being too far advanced or by pre-ignition, it will be clearly seen that the piston will be violently blown from one side of the cylinder to the other, and so cause the sound we know as pinking.

Fig. 3.
An engine with a hemispherical cylinder head soon after the commencement of the firing stroke.

Now, after this explanation, it will readily be seen that an engine with hemispherical cylinders does not pink to anything like the extent of a Γ or T-headed cylinder. Diagram 3 shows such a cylinder on the firing stroke. It is plain that in such a cylinder the rush of the gases is practically dead on the top of the piston, and not across as in the case of the Γ-headed cylinder; consequently, the only force which throws the piston from one side of the cylinder to the other is simply the reaction of the angularity of the connecting rod.

Now, as regards the last question, Why is a dirty engine noisy? the answer is, simply because such an engine suffers from pre-ignition. Owing to the valve chamber being left rough from the foundry without machining, the carbon gathers in spots on various rough projections, and remains in a more or less incandescent state, causing the engine to fire before the piston has advanced far enough on the firing stroke. This is easily proved by the fact that if such an engine is driven "all out" up a long hill and switched off at the top, it will fire for several moments before stopping.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Standardisation of Controls.

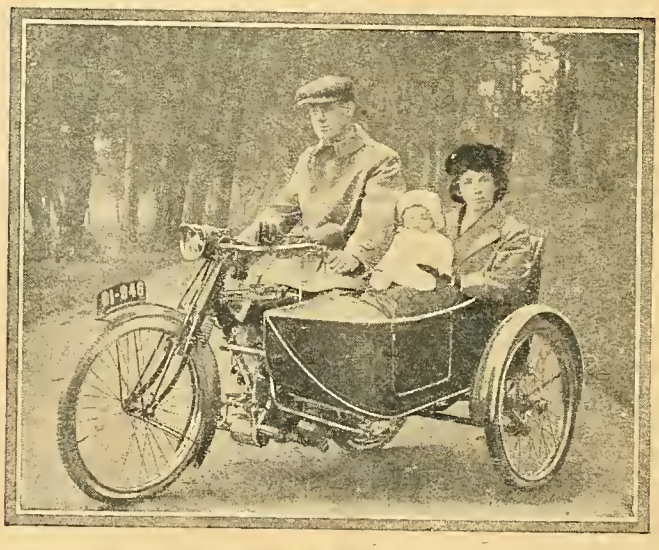
Sir,—I would like heartily to endorse all you say on this subject. I would even go further and have the words "air" and "gas" printed on the levers, and some safety arrangement, such as an arrow or label, showing direction in which to shut off.

Does it not also seem to you to be time for some International arrangement standardising the rule of the road? Within the limits of our own Empire the rule varies. In Canada (if I am not mistaken) vehicles meeting each other pass to the right, as in most Continental countries. Why not in the U.K.? WANDERER.

Two-stroke for Sidecar Work.

Sir,—Having read in the columns of *The Motor Cycle* interesting accounts of the doings of two-strokes, I have no doubt that you will be glad to hear from Ireland on the same subject.

Early in the past summer I purchased my first motor bicycle—a 2¾ h.p. Regina, two-speed, two-stroke. Having had no previous experience of anything beyond the pedal-propelled machine, it was with a certain amount of doubt and expectation that I ventured on my first run, which proved most enjoyable. After using the machine regularly for a considerable time, and being convinced that both frame and engine were powerful enough to take a sidecar, I had a Watsonian lightweight fitted accordingly, and have been using it with the most satisfactory results since. The little engine pulls splendidly, as some of my motoring friends with higher powered machines can testify. With sidecar and passenger it is surprising how well it will climb any reasonable main road hill; very seldom is it necessary to gear down. Never yet have I had to shed my passenger, and mechanical trouble is unknown. The point which now strikes me most is, when such satisfactory results can be obtained from a 2¾ h.p. two-stroke why so many riders go in for the higher powered machines for solo use. HERBERT NEILL.



Photograph accompanying H. Neill's letter

A Smart Repair.

Sir,—A grievance appearing from time to time in your columns is a very real one—the outrageous and inexcusable delay in supplying parts or effecting simple repairs—which seems to be the business motto of so many makers; a thing unknown in any other business. From this, I doubt whether anyone has been a greater sufferer than myself—fancy waiting six weeks for a new piston or a rebushing!

It, therefore, gives me all the more pleasure to be able to quote an exception. An accident on service duty resulted in such a crumpling of my Lucas lamp as to render it useless. I sent it to the makers by the mid-day post on Monday, October 19th, with an appeal for promptness in the circumstances, and received it back repaired—and well repaired—by mid-day on the following Wednesday. Considering this out of the way place (Middle Stoke, Rochester) is a long post from Birmingham, it cannot have been in their works more than an hour or two. I wish Lucas would make motor cycles! H. M. SPOOR, M.B.

Motor Cycles in War.

Sir,—Being a somewhat rabid motor cyclist, I have been wondering, since the outbreak of war, what part motor cycles will play in it.

The value of solo machines for scouting and despatch work is granted. There is also the possibility of using them for bringing up small bodies of troops to points of weakness where their presence is urgently required.

Another use, for sidecar machines, is that of forming machine gun sections, and I feel sure that they could be of considerable value in this.

I would suggest the use of a weapon similar to the machine gun of the Belgian dog-drawn batteries, to be mounted on the frame of the sidecar and operated from there, the mounting being adapted to high angle fire at aeroplanes. A gunner, either Regular or Territorial, would be carried besides the driver.

Volunteers would be divided up according to the type and make of their machines; all machines of one section to be similar. Each section to be about fifteen strong. The O.C. and two despatch riders to be mounted on solo machines. Attached to the section would be a motor car carrying oil, petrol, and all spares that could possibly be needed, in charge of a mechanic or tester from the works where the machines of the section were made, this mechanic to be responsible for the condition of the machines of his section. Individual machines would carry small spares, and would be fitted with spare independent tanks in case of the main tank being destroyed.

The mobility of such units, properly equipped and organised, would make them of inestimable value both for coast defence at home and also for use on the Continent.

Negritoe, near Paita, Pern. A. T. STURGESS.

[This letter, only just received, was written last September. —ED.]

Military Motor Cyclists and the Law.

Sir,—*Re* the paragraph on page 467 in *The Motor Cycle* of October 22nd commenting on a police court case at Scarborough in which a military motorist was charged with driving to the danger of the public.

We cannot all take an active share in defending our country, but we should all give help and encouragement to those who are doing so. At the same time we do not need to foster in our gallant defenders that spirit of which the higher (or lower) development is seen in the German military

caste. It is highly improbable, in England at the present time with telegraph and all ordinary means of communication intact, that any despatch need be given to a motorist for delivery regardless of personal or public safety. If a rider was handed a despatch which was so urgent that it had to be got through quickly at all costs it would be excusable, even though one or two civilians, soldiers, or the rider should be maimed or killed in the process. If the captain's evidence had been to the effect that the rider was carrying an officer's military (not private) message, for which there was the greatest need for speed, I feel sure no magistrate would have convicted. In fact, I am sufficiently assured of the good sense of the police to know that, given this explanation, the case would never have been brought into court. To act, however, as I am afraid that some riders are inclined to do (and as the paragraph in question might seem to uphold), on the assumption that being in uniform and on "a Government machine" they are therefore above all law, may lead, if generally adopted, to consequences perhaps a little less unpleasant than those arising from a German invasion. On the same principle, I do not think that the policeman mentioned in another paragraph in the same column was necessarily "officious," because he stopped a special constable motor cyclist who, apparently with no other excuse than that he was "wearing his badge of office," was breaking the regulations of a royal park. Without a valid excuse for speed, clearly it was the special constable who was "officious." What greater right has he to inconvenience other park users than, say, the ordinary business man hurrying to keep an important appointment? A friend from the Midlands on a visit has just expressed to me his surprise at having seen a large military motor proceeding out of the town without lighted lamps. A reasonable excuse for thus endangering the lives of the occupants and of other road users is not readily apparent, and, should a constable pull up the offending driver, I trust that one need be considered no less a true friend of the Army for commending this constable's courage and public spirit, and that at least he may be safe from accusation of excess of zeal.

I write thus because I think that it is inadvisable to let the inference go unchallenged that in such cases as that reported the civil authorities must abrogate all their power or be lacking in patriotism.

FREDERICK G. BINNING.

Petroil Lubrication.

Sir,—We have been much interested in reading your leading article in the last issue of your paper, which is in striking accordance with our own views as recently published in our treatise on the lubrication of the small petrol engine.

We there state that the *advantage* of the system is:

The lubrication of the engine is not dependent on the skill of the rider.

The *disadvantages* are as follow:

(*a*) Oil is not supplied proportionately to the power developed by the engine.

(*b*) The cylinder walls only are well lubricated as they are open to the incoming charge of petrol and oil, while the oil has to worm its way in to lubricate the other parts of the engines which are covered in.

(*c*) The charge of gas transferred to the cylinder is in a dirty state, and the maximum power cannot be obtained from the engine.

(*d*) Excessive carbonisation on the piston head due to oil being drawn in with the charge.

(*e*) Oil separates out in the carburetter, and combines with the ever-present dust from the road to clog up the working parts.

The semi-automatic drip feed, when used in conjunction with two-stroke engines, has always been used as a means of keeping the crank case free from oil, and the drip is led by ducts to the parts to be oiled, and we commend, for special attention later, the methods adopted by such manufacturers as Scott, Levis, and Peco, who have had a longer experience of the working of the two-stroke engine than most other competitors.

Regulated feed for the two-stroke is even more necessary than for the four-stroke, and by throttle control for preference.

BEST AND LLOYD, LTD.

JOHN H. COCHRANE (Sales Manager).

Mentioned in Despatches.

Sir,—With regard to your article "Mentioned in Despatches," a careful study of the list seems to suggest that altogether twelve motor cyclists are mentioned in the R.E. list. Bearing in mind that all motor cyclists are promoted corporal on enlistment, it will be found that there are a number of corporals whose regimental numbers fall between 28000 and 28100, and of these a certain number are known to be motor cyclists. The inference, then, is that all corporals in this group of numbers were enlisted about the same time and promoted about the same time. As some are known to have been promoted on the day of enlistment because they are motor cyclists, the inference is that the others are the same. The list is as follows (from *The Daily Telegraph*):

28031 Corpl. C. A. Brocklebank.
28051 Corpl. C. W. Cadman (motor cyclist).
28055 Sergt. E. S. Goodhart.
Corpl. D. Humphries (motor cyclist).
28110 Corpl. W. Lewis.
28056 Corpl. T. P. Morris.
28028 Corpl. C. F. Portal (since promoted second-lieut.)
28012 Sergt. A. Q. Roberts [now lieutenant, we understand.—ED.]
28005 Corpl. H. U. Scrutton.
28046 Corpl. J. A. Scrutton.
28059 Corpl. S. F. C. Stachard.
28149 Corpl. H. Trepas.

Only two of these are described as "motor cyclist" in the official list, but you have identified three more.

I may add I have enlisted six motor cyclists this week, and expect to enlist twelve more next week.

(REV.) F. W. HASSARD SHORT,
Secretary, Motor Cyclist Reserve Committee,
Home Counties Division.

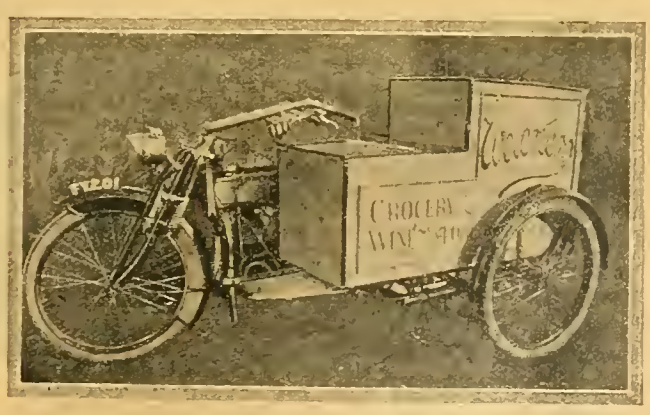
[It would appear from the Rev. F. W. Hassard Short's letter that other motor cyclists than those already specially referred to in these columns have been mentioned in despatches. If relatives or friends of motor cyclists mentioned in despatches, who have not already been credited with that honour, will communicate with us, *The Motor Cycle* will be pleased to publish their names. —ED.]

A Tradesman's Home-made Sidecarrier.

Sir,—Your interesting articles relating to the value of the motor cycle as a goods carrying agent have impressed me to the extent of building a vanlette as an auxiliary to my horse van service. The frame is substantially built of hard wood, and the roof will easily support twelve stone. The ends are ½in., and ¼in. three-ply is used for the sides. Weight five and a half stone. The lowest roof and flap above are hinged to give easy access to any part. There is also a door at the side on which the name is painted, and when this is locked no one can gain admittance. The vanlette is finished off with two shades of battleship grey with lettering and edging in black, completed with two coats of carriage varnish.

I shall be pleased to give dimensions to any interested reader. The motor bicycle which I use is a 5-6 h.p. twin Norton.

A. G. WEIERTER.



A home made sidecarrier (see letter)

Removing Douglas Cylinders.

Sir,—The splendid article on a T.T. Douglas by "Road Rider" in a recent issue of *The Motor Cycle* goes far, but misses a very important point, in my opinion—a point missed also by the riders and repairers alike all over the country. I refer to the slot in the front fixing for the engine.

Showing method of fixing the engine in the frame of a 2¾ h.p. Douglas.

As the other places for fixing are holes, the slot must be there for some purpose, and it is this. If the two back bolts are just slackened and the top bolt removed, then the bottom one, we leave the engine fixed by two bolts in front. If the top one of these is removed we leave the engine fixed by one bolt in a slot. Slacken this, and the whole unit can move backwards enough to remove the cylinder in front. The back cylinder presents no difficulty whatever, as there is nothing in the way. In this manner the Douglas can be cleaned of carbon in both cylinders without removal from the frame of the cycle inside ten minutes.

A better method, and one I adopt, is to use clock spring scrapers through the valve caps. The carbon can be all removed very successfully without any trouble or upsetting the engine in any way, and the engine can be kept clean inside as well as out more frequently when such a simple method is used ALBERT V. HUGHES.

Compressed Air Engines.

Sir,—I observe that Mr. Hughes, in common, unfortunately, with most people, seems to think that the days of steam are past. It is true that it is not now the only efficient form of heat engine as was the case thirty years ago, but in all other respects the days of steam are now.

A compressed air motor cycle, though for the reasons explained by Mr. Hughes quite impracticable, would undoubtedly have advantages not possessed by petrol machines. For example, absence of gear box and clutch, silence, perfect control and evenness of torque at the lowest speeds, to say nothing of easy starting and many other minor points. Such being the case, on looking round for another form of motive power with these qualities, steam at once presents itself. The modern steam generator in its various forms, as used on White, Stanley, and Pearson-Cox cars, so far from being huge, is exceedingly small, and perfectly adapted in this respect for motor cycles. With modern steam car practice as a guide, the designing of a bicycle should be a simple matter. The only difficulty lies in the storage of water, but by using a condenser a comparatively small tank could be employed.

This, to my mind, is the ideal general arrangement. A semi-flash boiler, well lagged and boxed in, placed in the position of a petrol motor. A twin-cylinder single-acting side by side engine would be a very small affair, and could be placed behind the boiler in front of the saddle tube, and have a direct chain drive of a ratio of about 4 to 1. The pumps, I consider, should form a separate unit, and have a long stroke, and run at a low speed. This could be fixed behind the saddle tube in front of the mudguard, and driven by chain as a magneto. JOHN H. HATCH.

Gear Slip on an Old Machine.

Sir,—Your correspondent "B 10" has experienced with his old machine the same trouble which I have had with my new one, and although it may have arisen from quite a different cause, I will explain, for his information, the very simple adjustment which, in my case, put matters right, although I cannot understand why it had the desired effect.

I had taken my machine down for cleaning purposes, and after reassembling went for a short trial run, when the trouble manifested itself for the first time. On examination, I noticed that the gear operating lever was, when in high gear, much lower down than usual, right below the tank, in fact. Thinking that I might as well alter this, but not imagining that it would affect my trouble, I removed the gear lever and operating chains and replaced them in a different position so that it was not necessary to press the handle so far down when changing into high gear. After this I had no more trouble.

I take it that your correspondent always pushes the gear lever well home when changing, and also, by means of the adjusting nut, keeps the operating lever fairly stiff on its pivot, as if it works too freely the gear is almost sure to slip sometimes. I shall be interested to hear if the above remarks prove to be of any use BENJAMIN NEWBERY.

Sir,—In reply to "B 10," I beg to say that I experienced the same trouble. The makers overhauled the gear, and fitted new wedge bars. It gripped for a number of miles, and then the high gear commenced to slip on hills. After a number of experiments and with the help of friends it was suggested that the wedge bars were slightly deeper than the bronze rings, and gripping the driving wheel without expanding the rings to their full extent. About $\frac{3}{32}$in. was taken off the top edge of each wedge bar by an emery wheel, which proved to be a cure. P. AND M. GEAR.

A Wonderful Recovery.

Sir,—The friends of our Mr. Sid. Morgan will be pleased to learn that he is now considered out of danger, and is the "show patient" at the hospital, his truly wonderful recovery having made him the subject of many little lectures to visiting doctors, etc.

There are few men can boast (perhaps few want to) of carrying a German shrapnel bullet embedded in the brain for seven days, but such was Morgan's experience.

Putting aside his motor bicycle for the rifle at the very commencement of hostilities, he went to the Front, and, at the battle of Mons, was the first man in his section to fall.

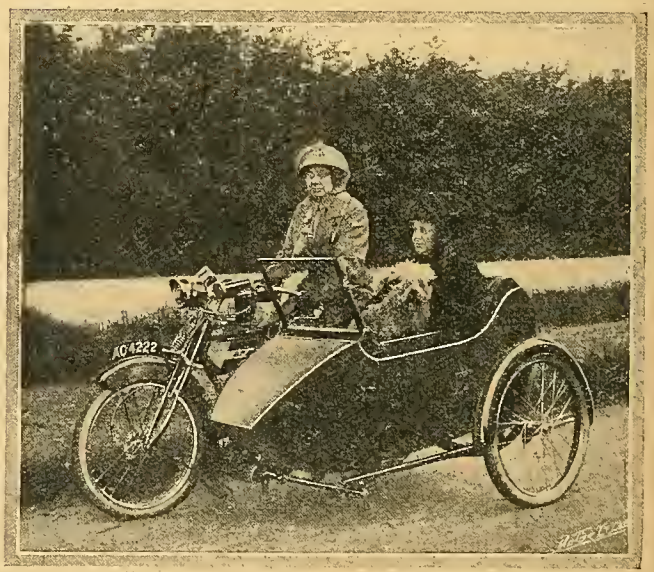
They had been three nights without sleep, and in the pitch darkness of the third night, crouching in the trenches—some of them were sharing a loaf—when the glare of a searchlight was thrown upon them, followed by the crash of shrapnel, and the mischief was done.

How Morgan reached Birmingham alive is still a mystery to the hospital staff, who upon his admittance gave him three hours to live; but with desperate courage the chief surgeon operated, removing the offending lead from the brain, and an abscess, which had formed between the brain and cranium; and, after eight weeks of suspense, Morgan still lives—the result of a miracle of modern surgery.

NORTON MOTORS, LTD.

SUMMARY OF CORRESPONDENCE.

C. H. Dickinson writes to say that he has connected the release valve of his two-stroke machine to the exhaust pipe through the frame of his machine, and finds the arrangement silent and clean.



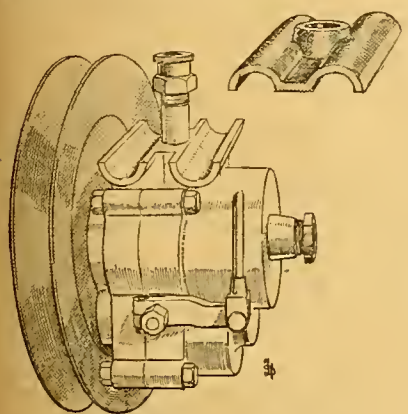
Miss R. A. Holmes, of Leamington Spa, one of the latest recruits to the ranks of lady sidecarists. Miss Holmes is seen mounted on her B.S.A. machine with a lady friend as passenger in the sidecar.

LATEST DESIGNS.

Advance Descriptions and Illustrations of 1915 Model Motor Cycles and Accessories.

A SPARKBROOK TWO-STROKE.

FOR some time past the Sparkbrook Company have been experimenting with a two-stroke machine, and it is many weeks ago since we took our first ride on the new model. At that time, however, the policy of the company was not definitely settled, and consequently we withheld any reference to this new model.



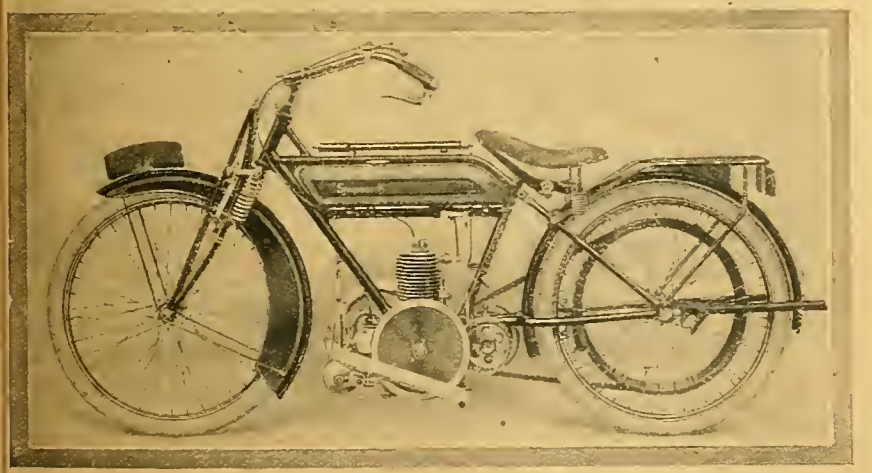
The Sparkbrook two-speed gear is held to the frame by a stout bolt, which also acts as an air vent and oil filler

The engine used is the 2¼ h.p. 70 × 70 mm. Villiers, with the usual neat arrangement of double silencer and magneto plate. A chain transmits the power to a two-speed gear, which is quite one of the neatest and soundest pieces of work we have yet seen on a small machine. The gear is of the usual dog clutch type, and both wheels and shafts are of the finest obtainable material, while all bearings are of the Skefko double row ball type with felt washers arranged to prevent oil leakage.

Oil leads have been formed wherever necessary, and the single bolt which is used to hold the box in position is of large diameter and hollow, so that it forms a convenient oil filler, and, by the addition of a small gauze filled cap, acts also as an air vent. This has proved to be an excellent feature, as it helps greatly to prevent oil leakage. In fact, we may say that the Sparkbrook two-stroke is one of the cleanest machines we have yet ridden. A 7in. pulley is used for the final transmission, and the front portion of the rear mudguard will be extended below the belt, a feature which almost eliminates belt slip even in the worst weather.

Lubrication via the Inlet Pipe.

Lubrication is simple in the extreme, for a Best and Lloyd semi automatic lubricator supplies oil direct to the inlet pipe, whence it is sucked into the engine and circulates in the usual manner. A Senspray carburetter with a neat and very effective intake shield is utilised. The tank has a capacity of one gallon of petrol and one quart of oil, and is neatly finished in black and green. The frame is very neat and strong, the head lug being a particularly sound piece of design. The control for the two-speed is very simple, being so arranged that a single-geared machine can be converted to a two-speed model by quite an amateur. Aluminium footboards, a stout carrier, 26in. × 2in. tyres, and excellent fittings and finish combine to make a most attractive and serviceable mount.



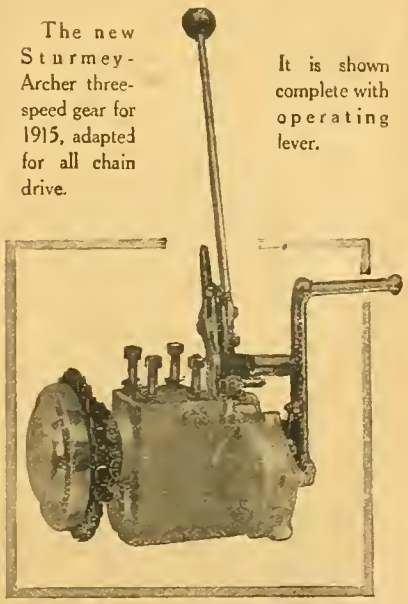
The latest 2¼ h.p. two-stroke two-speed Sparkbrook

THE STURMEY-ARCHER COUNTER-SHAFT GEAR.

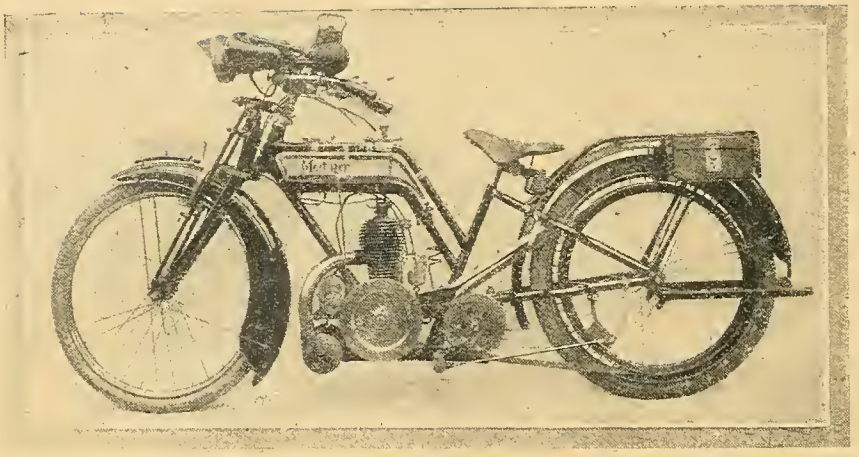
In our issue of August 27th we described and illustrated the new Sturmey-Archer counter-shaft gear adapted for chain and belt transmission. We now illustrate a similar gear designed for an all-chain drive. It will be remembered that the gear gives three ratios operated by sliding dogs, incorporated with which are a cork insert clutch and enclosed kick starter. As will be seen in appended photograph, the operating handle is capable of adjustment to suit the fancy of individual riders, and the four bolts by which the gear is attached are plainly shown; to admit of chain adjustment all these bolts are capable of sliding in the slots provided in the frame.

The new Sturmey-Archer three-speed gear for 1915, adapted for all chain drive.

It is shown complete with operating lever.



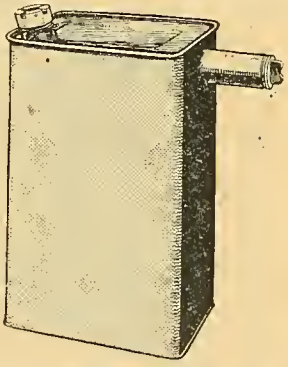
The clutch is said to be remarkably sweet in action, the pressure being obtained by a series of small springs which distribute it evenly over the whole surface. The enclosed kick starter is particularly neat in appearance.



The new lady's model Metro, which has a 269 c.c engine.

A LADY'S METRO.

An addition to the ranks of ladies' motor cycles is one produced by the Metro Manufacturing and Engineering Company, Adderley Park, Birmingham. This machine is exactly similar in specification to the diamond frame model which has been sold for some months past, having a two-stroke engine measuring 70 × 70 mm., giving a capacity of 269 c.c. The machine can be obtained single-geared, or, as illustrated, with a Roc two-speed counter-shaft gear, incorporating chain and belt drive at an extra charge. The saddle position is very low, being but 28in. from the ground, whilst the crank case clearance is as much as 6in.



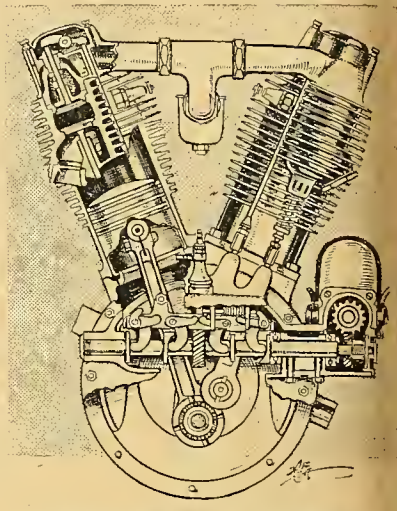
A petrol tin designed to overcome the objectionable splashing usual with tins of ordinary pattern. It is known as "Hersey's non-splashing patent petrol tin."

7 H.P. SPACKE ENGINE.

WE recently had the opportunity of examining and trying a 7 h.p. Spacke engine, which is to be handled in this country by Maude's Motor Mart, 113, Great Portland Street, W. The Spacke hails from the United States, and is a thoroughly sound and well-made job. The accompanying photographs show that the exterior of the engine is of clean design. It will be noticed that the inlet valves are of the overhead type, the mechanism being enclosed in a grease-tight box, thus ensuring silent running and adequate lubrication. The valves are of ample dimensions, being half the bore of the cylinders. The bore and stroke respectively are 82.55 × 93 (996 c.c.).

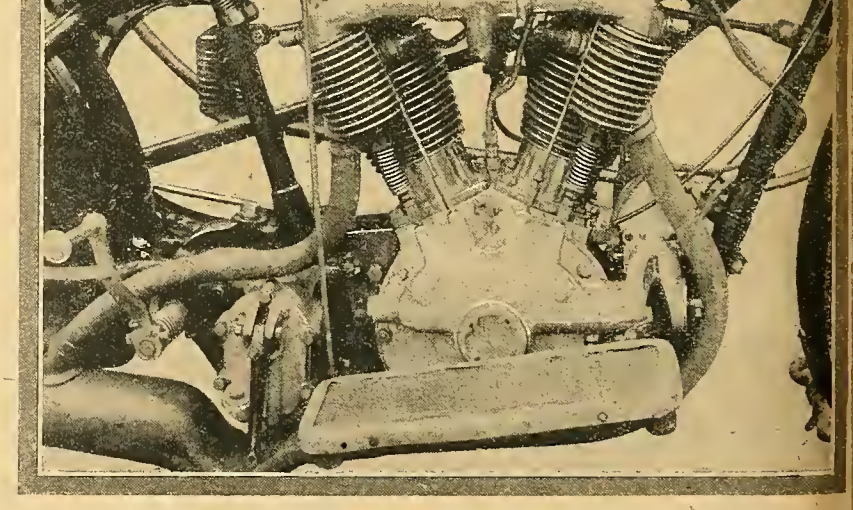
A most interesting feature about the engine is the valve mechanism, which the accompanying sketch shows quite clearly. The camshaft, it will be noticed, runs across the side of the crank case, and somewhat follows car practice. It is driven by means of skew gearing, and the four cams consist of four discs turned out of the shaft upon which the cam faces are cut. Two ball thrust bearings are fitted at each end of the camshaft to take up the end thrust. The connecting rods are provided with roller bearings of large dimensions, both as regards diameter and width, and are contained in steel housings. Ball bearings of large size are fitted to both sides of the crankshaft. In designing the engine every effort has been made to render its working as silent as possible.

This engine has been fitted to the frame of a second-hand motor bicycle and side car, on which we were given a trial run which included the ascent of Swain's Lane, Hampstead (gradient about 1 in 6). On the occasion of the first attempt a



The Spacke power unit, showing timing gear, big end roller bearings and magneto drive.

change down to second was made at the steepest portion on account of clutch slip but the second time the combination climbed the hill on top speed, though it is only fair to say that the slight amount of clutch slip still remaining facilitated its accomplishing this. Nevertheless, it must be admitted that the engine pulled particularly well, especially at slow speeds, and ran very smoothly. Altogether we were favourably impressed by its running, and found that it compared very well with other makes of V twins at present on the market.

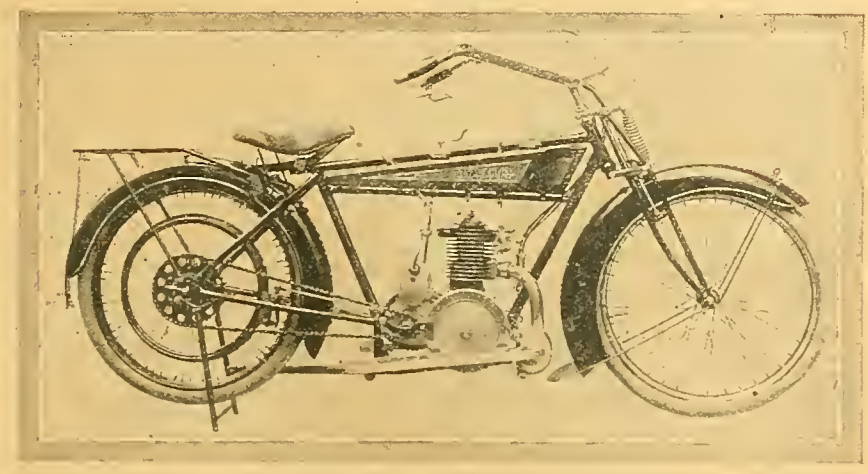


The Spacke twin-cylinder engine fitted into a Rex frame.

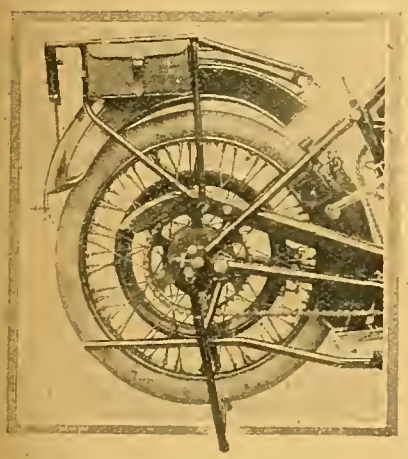
The New Two-stroke Enfield.

A New Model for the Enfield Co.: Refinements on the Sidecar Outfit.

THE two-stroke Enfield, which made its first public appearance at the Coventry and Warwickshire Motor Club's hill-climb, has been improved out of all knowledge, and will be bound to make a strong appeal to the ever-growing army of two-stroke enthusiasts in 1915. Practically throughout the year the Enfield Co. has been experimenting with a view to producing a reliable two-stroke lightweight for next year's market, and last week we inspected the outcome of those experiments, and are able to present our readers with a description and illustrations. The new Enfield is of really practical design, and, what is more, of attractive appearance—a combination difficult to obtain.



Flywheel side of the new 2¼ h.p. two-stroke Enfield



The detachable carrier and guard fitted to 1915 model Enfields

The Power Unit.

The engine is rated at 2¼ h.p., measuring 64 × 70 mm., giving a capacity of 250 c.c. The cylinder is a fine specimen of the foundry worker's art, the fins measuring 1¼in. deep The inlet and exhaust ports are arranged in front, and in juxtaposition—a practice which seems to be gaining favour. The release valve is arranged horizontally just above the ports, and a pipe conveys the released gases into the exhaust.

The piston is of orthodox design, with a deflector on top, and a ring top and bottom. An outside flywheel is mounted on the right-hand side of the machine, keyed to the mainshaft, and the drive to the Enfield two-speed gear in the countershaft is on the opposite side.

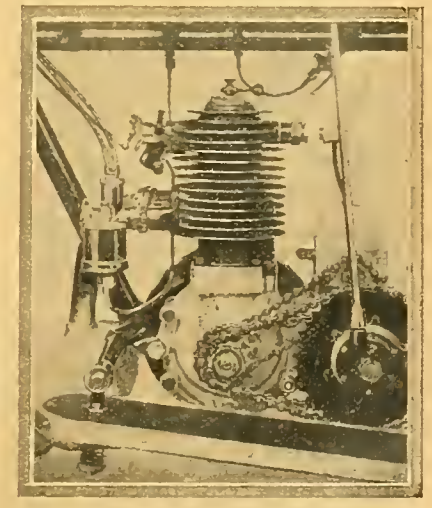
Easily Detachable.

Accessibility has been well studied, for the gear is contained in an aluminium bracket behind the crank case, and on the top of the housing a platform is arranged for the magneto. Thus, by removing two bolts at the rear and one in front of the engine and disconnecting the rear chain, the whole power unit can be dropped out of the frame without disturbing the timing, carburetter, or the pair of engine chains.

Roller bearings of Enfield design are used for both crank bearings, the connecting rod bearing being plain.

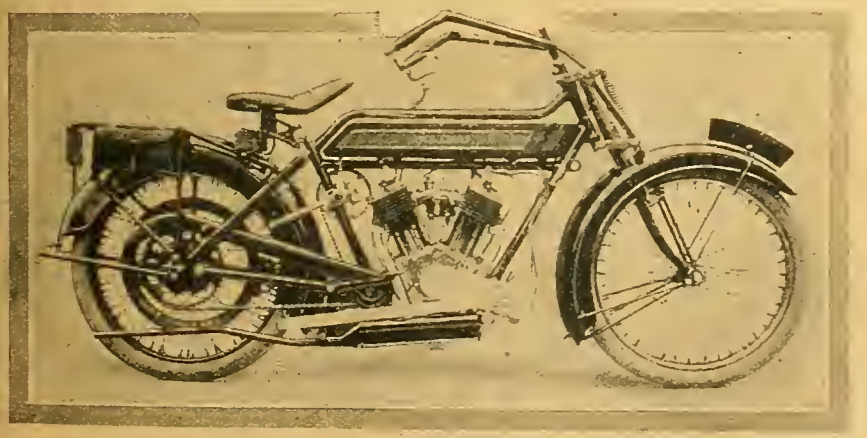
The top tube of the frame slopes downward from the head, giving an extremely low riding position. The tank which is shaped to fit the triangle has the oil compartment at the rear, and a pump is provided, together with a connecting pipe to the petrol compartment, to feed oil into the petrol in suitable proportions. An Amac carburetter is used in conjunction with this "petroil" system

Spring forks of a design successfully used on Enfield productions for some years past have been adopted, with a single spring in front and round section tubing The portion of the rear mud-



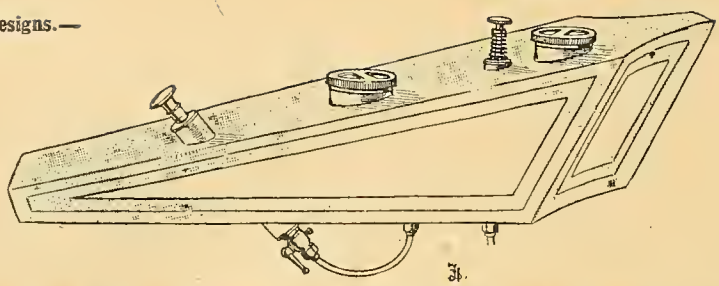
The power unit of the 2¼ h.p. two-stroke Enfield

guard from the rear stays, including the carrier, is arranged to be removable by simply slacking two bolts on the end of the chain stays. This feature, which will be appreciated when tyre troubles come along, has also been standardised on the new 6 h.p. sidecar outfit. Aluminium footplates sprung in front are used, and the Enfield cush drive, as on the 3 h.p. mount, is arranged in the rear hub. The standard handle-bars are all black, and



The new 6 h.p. Enfield, with dropped frame and particularly large mudguards

New Designs.—

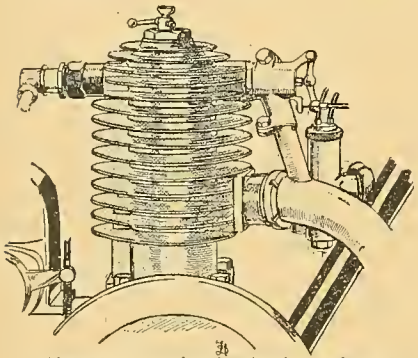


Tapered tank of Enfield two-stroke. Note how the oil is pumped direct into the petrol compartment in front.

with 2in. tyres the machine is to be sold at thirty-eight guineas.

The 6 h.p. Sidecar.

Though there are no startling alterations on the sidecar outfit, many refinements have been introduced, most of which received a test of the most destructive type in the A.C.U. Six Days Trials last July. First of all, the top tube is dropped at the rear end, and the new dome-shaped mudguards should prove very efficient in wet weather. The front guard is exceptionally wide, and side extensions are formed their whole length. We have already referred to the detachable carrier and guard, which incidentally can be removed in half a minute. The Enfield Co., it may be remarked, was among the first to form the sidecar

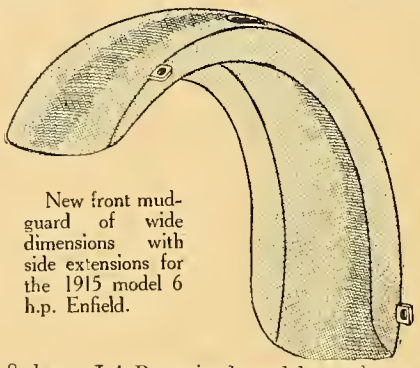


Enfield two-stroke, showing how inlet and exhaust pipes start from a common plate in front, and the method of leading the release gas into the exhaust pipe

attachments integral with the bicycle frame, and to produce a motor bicycle specially for sidecar work and sold as a complete outfit.

To enable the rear wheel to be readily removable, the brake is now arranged to operate inside the groove of the dummy belt rim connected to the left-hand side of the driving wheel, though the pedal is on the right-hand side, the connections being carried in a lug formed with the frame. We were glad to notice the greatly increased strength of the forks, the side plate links being of large flat section, and the bolts secured by castellated nuts and split pins. Both fork and girder are of round section. A permanent lamp support is obtained by extending the handle-bar stem.

As regards the sidecar, the band brake, which we have mentioned was being tested, has been discarded. Again, the mudguarding has been improved by the fitting of an inside shield which extends over half the wheel. Tool spaces are arranged both under the seat and under the front of the body, and a spring luggage carrier is standard. The price remains as before, viz., 80 guineas, with an increase of 2 guineas for the

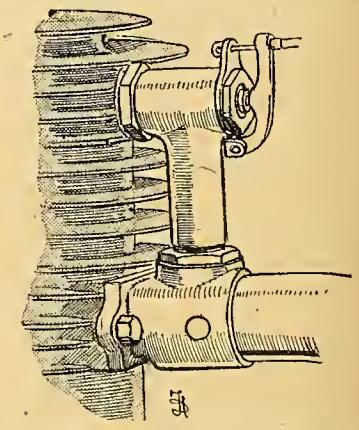


New front mudguard of wide dimensions with side extensions for the 1915 model 6 h.p. Enfield.

8 h.p. J.A.P.-engined model, and we have already mentioned that the outfit may be obtained, complete with Lucas lighting set and all fittings ready for the road, at £100 complete.

OMEGA TWO-STROKE.

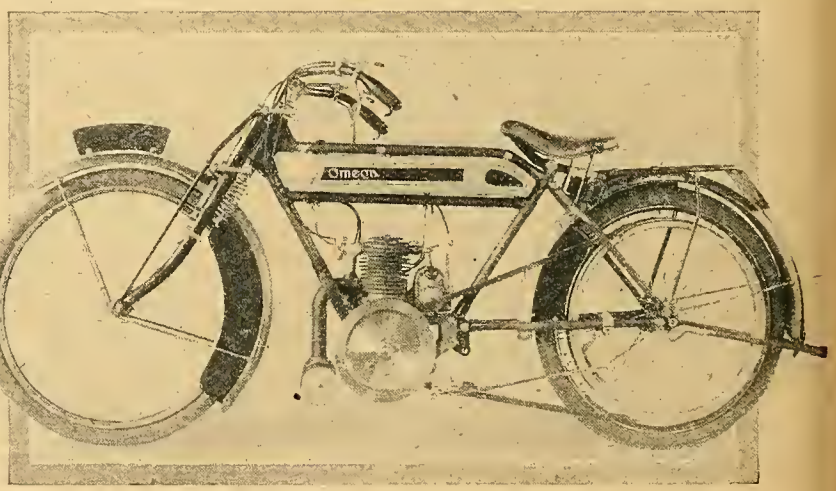
THE Omega two-stroke, which is manufactured by W. J. Green, Ltd., at Croft Road, Coventry, has undergone several important modifications, and the latest model is a most taking mount. The 345 c.c. engine has a bore and stroke of 76 × 76 mm., and has been redesigned in several details with the view of increasing its efficiency and life. A special roller bearing big end, the outer cage of which, formed by the end of the connecting rod, which is, of course, hardened and ground, allows the crank case to be narrowed considerably, and higher crank case compression is employed The shape of the piston baffle has been modified and three rings are fitted, the centre one being used to lock the gudgeon pin. Oil is led direct into the inlet port from a neat little adjustable drip feed, and the release valve is connected directly with the exhaust



Omega release valve, which is connected to exhaust pipe.

pipe. The fittings throughout are very well carried out, and the rounded sides of the petrol tank lend a very smart appearance to the machine. In spite of the 26 × 2in. wheels, girder Druid forks, stout stand, carrier, and mudguards, the complete machine is very light, and we are told that 130 lb. includes a two-speed counter-shaft gear. We were particularly pleased to notice that a large pan saddle is included in the specification.

The handle-bars, too, are wide, giving a comfortable riding position. As regards gears, either a two or three-speed counter-shaft box may be obtained, but even the single-geared model is very flexible and a sound touring machine for moderately hilly country.



The 345 c.c. Omega two-stroke for 1915.

A New Twin A.J.S. of 4 h.p.

550 c.c. Engine; Sloping Top Tube; New Design Forks; Enclosed Chain Drive.

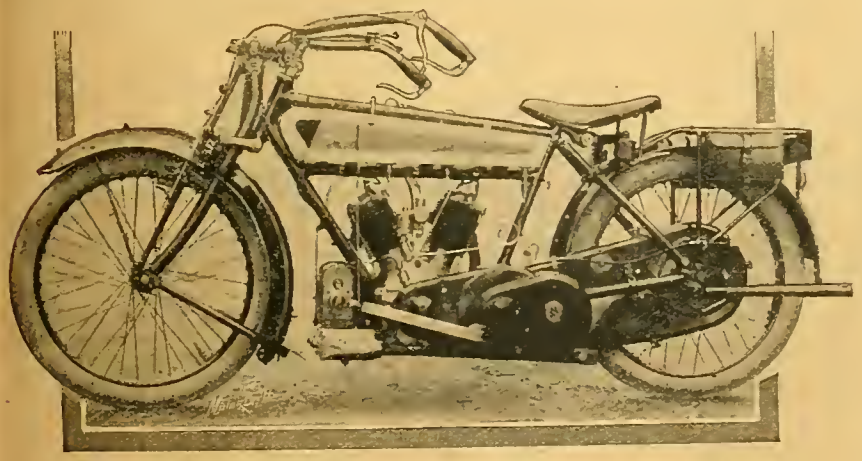
QUITE a departure from the standard A.J.S. is the new 4 h.p. twin-cylinder mount, which has many interesting features to recommend it. The engine and transmission are on exactly the same lines as those of last year's twin, but are, of course, somewhat smaller. The bore and stroke of the new engine are 65 × 83 mm. respectively, giving a cubic capacity of 550 c.c. The valves are of large size, situated side by side, and are operated in the usual A.J.S. manner, and the silencer, though placed as before, is of somewhat different design, having a single tail pipe extending rearwards from the back of the aluminium casting.

The excellence of A.J.S. chain guarding is already too well-known to need further description, and as the firm have always paid particular attention to making a cleanly machine, it is hardly surprising to notice that an unusual type of front mudguard is being tried. To the usual type of guard are attached wide, flat side wings with a wide, rearwardly projecting flange at the bottom. This attachment can easily be removed for speed purposes, but is so effective that the magneto and leg guard, which have been a feature of 1914 A.J.S. models, can, it is said, be dispensed with altogether

The Lubrication System.

The lubrication system is as before, a drip feed supplying oil to the inside of the crankshaft, whence it is circulated to all the main plain bearings, but the oiler has been changed for the latest type of Best and Lloyd semi-automatic drip, which has a circular sight gauge arranged at a convenient angle, so that it is particularly easy for the driver to see the flow.

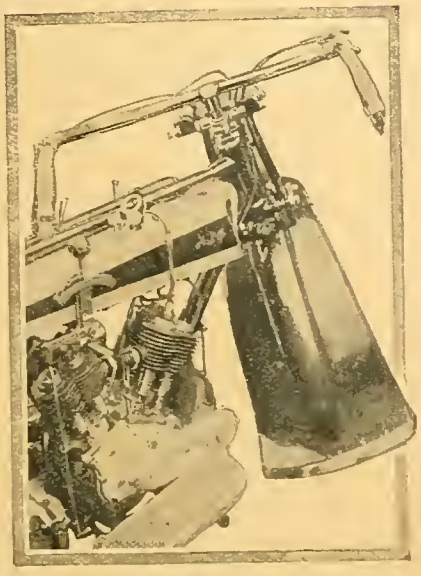
Perhaps the most startling innovation lies in the sloping top tube of the frame, an item which is becoming increasingly popular and which is a decidedly practical proposition, allowing a low riding position without the necessity for a bend in the frame, though it can hardly be said that it lends additional grace. The latest type of Brampton fork with two sets of top springs is fitted, and pannier tool-bags have been adopted. A.J.S. detachable wheels, shod with heavy tyres, help to complete a thoroughly well fitted out machine, which should admirably fulfil the purpose for which it has been designed, that is, a handy and fast solo mount, which is, at the same time, sufficiently powerful to take a sidecar through almost any country, especially as the lowest gear ratio provided in the three-speed gear is 17—1.



The new 4 h.p. twin-cylinder A.J.S. for 1915, which has a sloping top tube

OPENING FOR BRITISH MACHINES IN RUSSIA.

The military authorities in Russia having requisitioned for the war a large number of motor cycles, the members of the Moscow Motor Cyclists' Club, over a hundred in number, have almost to a man been left without machines. Winter riding in Russia is almost impossible, but in the early spring there will be a great demand for English machines. A number of influential members are at present formulating a scheme for the purchase by the club of a large number of English machines on co-operative principles, for the benefit of the members, and those manufacturers who are interested in export business would do well to send to the secretary, whose address is The Moscow Motor Cyclists' Club, Khodinka, Tzarsky Pavilion, Moscow, Russia, catalogues, with prices and full descriptions of their productions, stating the best terms they would be prepared to allow the Club, remembering that for Russia exceptionally strong machines are necessary, and reinforced frames, thicker tyres, stronger front forks, and thicker spokes and rims are a *sine quâ non* to the Russian rider, owing to the rugged roads in that part of the world. Springing fore and aft is also very desirable. The Russian rider does not mind weight, so long as he gets strength and reliability. Large petrol and oil tanks are indispensable.



Showing the new design of front mudguard, valve side of engine, change-speed lever, and sight feed lubricator on top of tank.

Hitherto, the Germans have had the lion's share of the Russian market, but, as a result of the war, there is a very strong agitation now going on all over Russia in favour of a complete boycott of all German productions, so that the present is an excellent opportunity for the British manufacturer to obtain a firm footing on the Russian market.

Despatch Riders for the Armoured Car Scheme.

Although a great number of motor cyclists have already been enrolled as despatch riders for service in connection with the armoured car scheme of the newly-formed Naval Brigade, we understand that the authorities have decided largely to increase the despatch riding division, and that, consequently, there is an opening for a still further number of motor cyclists, who, in addition to being expert riders, have some knowledge of the French language. Full particulars as to pay, rating, kit, provision of machines, etc., can be had on application between the hours of 10.30 and 11.30 a.m. to Sub-Lieutenant Stocks (well-known in connection with the De Dion Bouton Co.), Naval Air Recruiting Station, Wormwood Scrubbs, W

Another 200 Douglas machines have been ordered by the War Office

There are seventeen motor cyclist despatch riders attached to the 7th (Cyclists) Battalion Devonshire Regiment, which includes Sergeant P. Pike, late rider of a T.T. Levis, and John Gibson, who has competed in previous T T Races and other important events. The battalion is at present stationed on the East Coast.

TALES FROM THE FRONT.

Manx Motor Cyclist at the Front.

Corporal D. M. Brown, the well-known Manx motor cyclist, is acting as a despatch rider with the R.E. in France Duggie Brown, as he is better known, is a rider of Rover machines, and has taken part in many T.T races and Six Days and other trials. The accompanying photograph was taken just before leaving Aldershot for France. He is using the bicycle he rode in the Six Days Trials this year. Letters have been received from him saying he is quite well and having a good time. He was last heard of from Abbeville, on the French coast, travelling towards Belgium.

The Difficult Work of Motor Cyclists

We have had an interesting letter from Mr Glynn Rowden, who is at present driving a motor ambulance in France. "The motor cyclists," he says, "are doing splendid work in carrying despatches, but their task is particularly arduous owing to the heavy traffic, as the roads are one long fog of dust. I saw one man nearly killed by a motor suddenly looming out of the fog as he was passing me travelling the other way. When wet the roads are inches deep in slime and mud. Bent handle-bars, footrests, broken spokes, and lamps are evidence of the difficulties and dangers to be faced. Rims should be stronger and mudguards should be made with greater clearance, as the mud at times completely jams the wheels. Punctures are very numerous, most of them being caused by hobnails from the boots of peasants. The French machines are a long way behind the times, and most have no exhaust pipes or silencers. I saw a French soldier the other day start his machine on the stand and then run, with the engine still firing, and jump on, trailing the stand behind him. There is not much chance to do repairs, and machines, if they go wrong, are scrapped and replaced by new ones. I have just had a chat with a despatch rider who has been bayoneted by a German, and on another occasion had both tyres punctured by bullets, while one night he had a bad spill through being thrown in the darkness owing to a hole caused by a shell.

"The counter-shaft gears are most suitable for work over here, while extra strong frames and a very low riding position are necessary. The machines doing the best at present are Douglas, P. and M., and B.S.A."

Rowlandson's New Role at the Front.

S. A. Rowlandson has received early promotion, and is now a lance-corporal. We have received a copy of a further interesting letter he has addressed to Mr. V. A. Holroyd, which we give below:

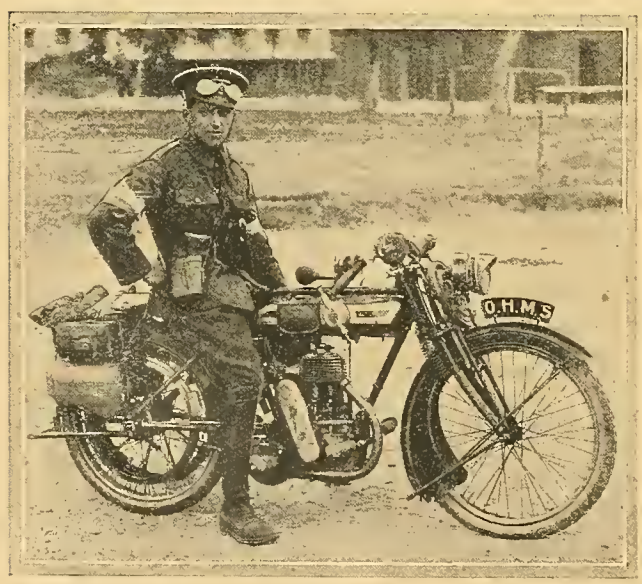
"Am snatching the chance of writing you before we move further on, when I expect we shall have very little time for writing. Since my last letter to you we have advanced nearly two hundred miles by a rather roundabout way. The whole of the way Noble and myself, on the Rudges, have acted as advance scouts, finding the way; and at the base we go out in much the same way and locate the troops, from whom we have forage and food.

"As I write this letter, about twenty yards away in the direction of the firing line, there are passing about twenty-five to thirty thousand troops for the firing line. After these have passed the horse transport follow, and then the motor transport. Expect we shall move about midnight. The troops have been passing now for three solid hours. To make things more interesting we can hear the boom of the big guns, and have done so for the last three days; evidently there has been a very severe battle raging.

"Have met many fellows I know—Monday, Duggie Brown and Howard Newman—yesterday two boys from the Naval Air Service with an armoured car. To-night I expect a visit from Cyril Pullin, who is attached to the Royal Naval Air Service. I learn that Mr. Nelson's son, also of the R.N.A.S., is at present at—well, not so very far from where the Roue Rudge detachables were being made before the war broke out.

"The nearer we get to the Front the more interesting it becomes, and in a day or two presume we shall have a hotter time still. For the last ten days we have had no letters, and for over a week no English newspapers. You can just imagine how much we know about the fighting."

[*Assistant Works Manager of Rudge-Whitworth, Ltd.—ED.]



Corporal D. M. Brown (the Manx T.T. rider), one of the motor cyclist section attached to the L Signal Corps of the British Expeditionary Force.

Lance-Corporal S A Rowlandson.

Falls Due to Appalling Roads.

Below we give extracts of letters received from B. and E. Rice, motor cyclist despatch riders at the Front, by their father, Dr. Rice, of Allesley, near Coventry.

"We are having a most strenuous time of it just now, but are enjoying it all the same. The roads here are appalling, and we are more off our machines than on them. I seem to live at the repair car! We have seen any amount of the Indian troops lately. They are truly splendid fellows, and should knock holes in the Germans. The natives here tell us that the German soldiers are terrified of us, and rushed about in a panic when the Scotsmen started to advance! I only hope we get into the Fatherland before long. There has been a regular procession of London 'buses by here to-day."—BERNARD.

"I am attached to a brigade at present, just trying to make myself useful by finding out when the guns require any ammunition, which just lately has been pretty often. Major Short's battery alone fired 1,216 rounds of eighteen-pounder ammunition in one day. The weather for the last week has been splendid in spite of the incessant gun fire. Aeroplanes are getting more common every day, perhaps the fine weather is bringing them out."—EDDIE.

We understand that the War Office has revised its list of machines which will be accepted for service. This is now as follows: Triumph, Rudge, B.S.A., Douglas, and Phelon and Moore. Should suitable applicants not be in possession of either one of the above-named motor bicycles, which must not be earlier than 1913 models, Government motor bicycles will be provided.

Wolverhampton M.C.C.

A smoking concert was held on the 31st ult. Mr. J. T. Ireland will read a paper entitled "A Day in a Garage" on Saturday next.

Eastern Counties M.C.C.

The closing run was held last week to Harlow and back. Arrangements have been made for a series of club suppers at the country quarters during the winter.

Coventry and Warwickshire M.C.

Among the members who are serving their country at the Front, and thus doing credit to themselves and their club, are the following: Corpl. G. E. Cuffe, Corpl. G. I. Francis, Corpl. T. E. Newsome, Corpl. A. Hill, Capt. E. Rotherham, Lance-Corpl. S. A. Rowlandson, Major A. P. Smith, Corpl. H. Trepass, Corpl. C T Newsome, Corpl. J. H. Pountney, and Corpl. R. B. Ewens. Old members: Capt. Mortimer. Corpl C. S. Burney, Corpl. V. Taylor, and Corpl. E A. Burney.

Loftus and District M.C.

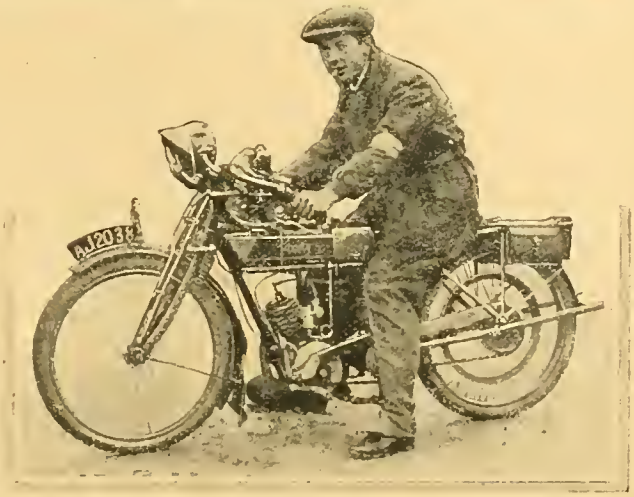
The autumn reliability trial was held last week through Loftus, Lockwood Beck, Commondale, Dibble Bridge, Castleton, Danby End, Lealholm, Glaisdale, to Limber Hill, and then on to Egton for lunch, and afterwards to the test hill through Grosmount village. A very heavy mist was hanging about in the morning, and later the rain made the roads very bad. Thirteen competitors started, but only nine finished the course. The best performances on Limber Hill, Glaisdale, were made by P. Thompson (3½ twin James) and Dr. Raw (2½ A.J.S.). On the test hill Thompson and Raw again came out on top, and tied for first place. Results:

	Rider and machine.	Marks lost.
1.	P. Thompson (3½ twin James)	2
	Dr. Raw (2½ A.J.S.)	2
2.	H. Johnson (3½ New Hudson)	7
3.	G. Duck (3½ B.S.A.)	10
4.	W. Cook (7-9 Indian)	11
5.	H. Lamb (5-6 Rex)	15

The competitors unanimously agreed that, instead of prizes, the entrance fees be handed over to the Belgian Relief Fund.

AN ITALIAN SIDECAR AMBULANCE.

The makers of the Frera motor cycle in Italy have just produced the sidecar ambulance illustrated.



P. Thompson (3½ h.p. twin James), who tied with Dr. Raw, of Whitby (riding a 2½ h.p. A.J.S.), for first place at the Autumn Trial of the Loftus and District M.C.C., described on this page.

SATURDAY AND SUNDAY RALLIES.

We have already announced the rallies to be held by the Cyclecar Club at Hatfield, Burford Bridge, and Wisley, on November 21st and 22nd. The 1915 models will be lined up apart from the cars of those visiting the rallies, and each model will bear a card stating its name and price. The committee appointed to award prizes consists of Dr. A. M. Low and Messrs. T. W. Loughborough and W. Cooper. A driver may attend one or all of these rallies.

MOTOR CYCLE HILL-CLIMB IN CANADA.

Although the great European conflict is a matter of deep concern to Canadians, yet Jack Canuck is not forgetting that Jack at play is much better off than a dull boy. Without exception all of the scheduled motor cycling and bicycling events are being run off throughout the Dominion without hitch, and the general public, seemingly, is taking as great an interest in the sports as usual.

The Toronto Motor Cycle Club held a "War Time" hill-climbing contest on a road just beyond the city limits of Toronto on a recent Saturday, when riders of British motor cycles carried off the majority of prizes Warden (Douglas) captured first place in the 2¾ h.p. fast amateur climb, with Holmes (Douglas) second, and Greenwood (Triumph) third. The slow event for this class was won by Greenwood (Triumph), with Holmes (Douglas) second.

The 4 h.p. class for amateurs was won by Greenwood (Triumph), Barnes (Triumph) second and Holmes (Douglas) third. Newport (Douglas) was first in the 4 h.p. slow event, Johnson (Triumph) second, and Greenwood (Triumph) third.

The 7 h.p. slow race for amateurs was won by Newport with a Douglas. An American machine was the first in the 7 h.p. fast climb for sidecars, but Holmes (Matchless) drove second, and Meldrum (Matchless) third.

The slow sidecar event was won by Holmes (Matchless), Meldrum (Matchless) being second.

The summary shows that British motor cycles won sixteen prizes out of a possible twenty-three, of which both the Triumph and Douglas took six each, and the Matchless entrants carried off four prizes. It was a wonderful showing for the British models.

More Despatch Riders for the Front.

Nearly a score of motor cyclist despatch-riders from the Wolverhampton district went to the Front last week.

Eighty-one Employees Join the Colours.

A list of eighty-one employees of Messrs. Iliffe and Sons Ltd., proprietors of *The Motor Cycle*, who have joined one or other of the different branches of His Majesty's service, will be found on another page of this issue.

Sidecar Trips for Refugees.

It has been suggested in the Bradford press that the local motor cycle club arrange a meeting of their sidecar members, and take a party of Belgian refugees a run into the country. This is an extension of the sidecar Samaritan scheme, and might be taken up by clubs in other districts.

First Details of New Models.

Four entirely new two-stroke lightweight machines are described and illustrated exclusively in this issue. This increasing popularity of the two-stroke engine which has given the lightweight such a fillip is remarkable. The models dealt with in this issue of *The Motor Cycle*, viz., the new two-stroke Enfield, Sparkbrook, Omega, and the Lady's Metro. Another 1915 model described and illustrated is the 4 h.p. twin A.J.S.

Motoring and the War.

The war has fortunately not had the adverse effect on motoring which, in its earlier stages, it was thought it would have. During the week-end as many motor vehicles of all sorts were to be seen at the "Hut" as on an afternoon in July. Among the crowd were many motor cyclists in uniform. We particularly noticed Corporal Busby, R.E., who is now at Aldershot, and Corporal Taylor, R.E. of the Essex Motor Club, who was wounded and is now quite fit.

Modification in Frame Design.

The sloping top tube is gaining favour. Two 1915 models described in this issue have this feature of design, viz., the new two-stroke 2¼ h.p. Enfield and a new 4 h.p. twin-cylinder A.J.S. Another make of two-stroke possessing this feature—the Alldays, which, we hear, is to be named the "Allon"—was illustrated in our special Two-stroke and Lightweight Number of July 23rd

The Legion of Honour.

Corporal W. H. Tait, R.E., a Caius College, Cambridge, man, has recently been given the *Légion d'Honneur* by the French Government for conspicuous bravery, and it is strongly rumoured that one of the Roberts brothers has met with similar distinction.

Motor Cycling Club Fixtures.

On account of the war the Motor Cycling Club has reluctantly decided to abandon the usual winter run to Exeter and back, which has become so popular of recent years. And for the same reason the annual dinner and presentation of prizes, provisionally fixed for December, will not take place this year.

The Growth of the Sidecar in America.

The increasing popularity of the sidecar on the other side of the Atlantic is clearly shown by the new models exhibited at Chicago, and there is a tendency for motor cycle manufacturers to build sidecars to fit their own machines. More attention, too, is being given to the brake work, which is so important when a sidecar is fitted. All black weatherproof finish is showing signs of becoming popular.

SPECIAL FEATURES.

FOUR NEW TWO-STROKE LIGHTWEIGHTS.
Described and Illustrated.

WHY DOES AN ENGINE KONK?

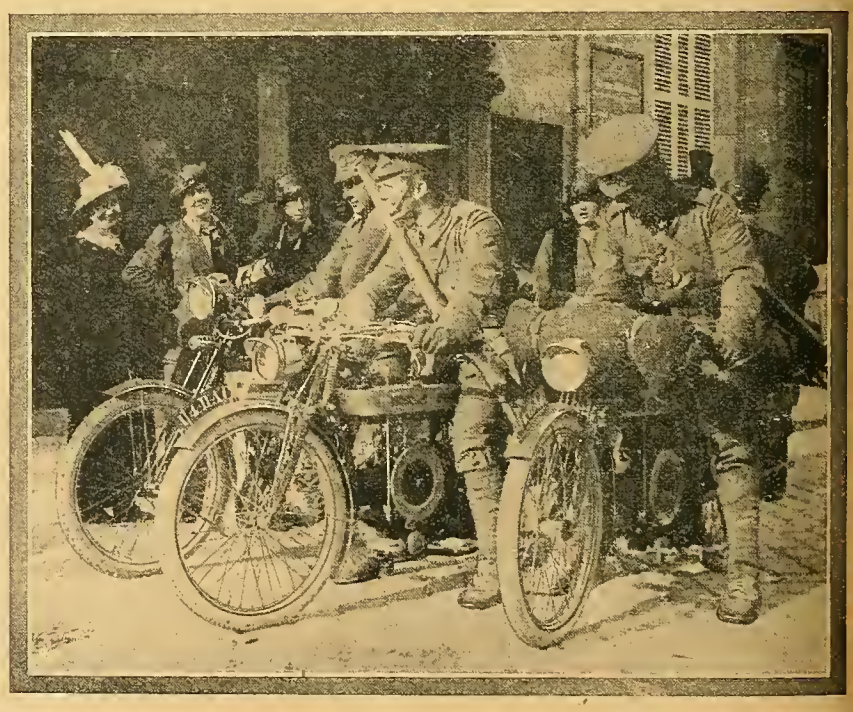
THE TREND OF DESIGN IN AMERICA.

"The Motor Cycle" at the Front.

Lance-Corporal S. A. Rowlandson wrote home last week that *The Motor Cycle* is devoured by the motor cyclists at the Front. It is, however, rather curious that the news most eagerly sought for is the experiences of fellow despatch riders at the Front.

Chicago Show Statistics.

The statistics of the Chicago Motor Cycle Show indicate clearly the general trend of American design. Out of fifty-five machines thirteen had single-cylinder engines, there were forty-seven twins, and three four-cylinder models. Thus, only 23% of the whole were singles, which shows that this type of machine is much less popular than in this country. Again, the starter is demonstrating its superiority to pedal gearing, as evidenced by forty-eight machines, over 87%, being equipped in this way.



British motor cyclist despatch riders passing through ——— near the firing line in France. (Two are riders of Douglases, the other of a Triumph.)

BOWDEN WIRE

BOWDEN Wire Mechanism assures the highest efficiency of control. Fitted to your motor cycle it will increase its safety and reliability.

All the Bowden Aids to Efficiency are designed and made by experts of practical experience who know where aids to efficiency and economy are necessary. A few are shown below, but there are many others fully described and illustrated in our 72 page catalogue. Write for a copy to-day.

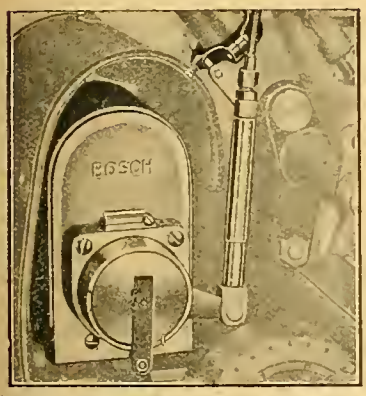
BOWDEN SILVER.

BOWDENITE.

BOWDENOIR.

BOWDEN SOLO.

BOWDEN WIRE. For Controlling Brakes, Clutch, Air Inlet, Magneto, etc. Made in various strengths and finishes at from 2d. to 1/2 per foot.



BOWDEN MAGNETO CONTROL

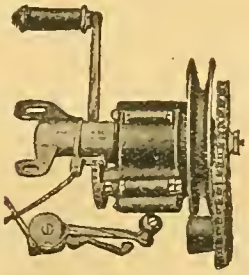
gives complete command of magneto adjustment from handle-bar—easily fitted to any machine. Just four screws to screw up—that's all.

Prices from 8/6

BOWDEN CONTROL LEVERS

for Brake, Clutch, Air Inlet, Magneto, and other controls are made straight or curved, and for one, two, or three movements.

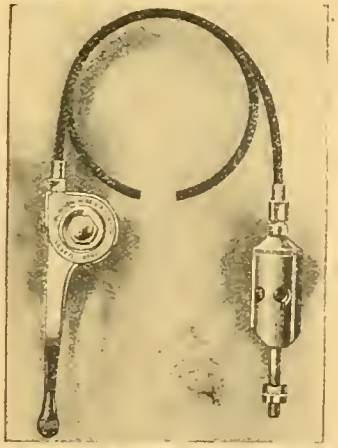
No. 403.
For One Movement,
5/-
Lever only.



BOWDEN TWO-SPEED GEAR.

Fits a number of machines without any, and most machines with slight, alteration. The parts are few and simple. Counter-shaft type with Kick-starter. Guaranteed for engines up to 6 h.p.

Price from £8 8s.



BOWDEN EXTRA AIR INLET

A great Money Saver. Reduces Petrol Bill. Keeps the Engine clean and cool, and increases its efficiency. Provides an auxiliary brake. Write for descriptive folder.

CONTROL LEVER.

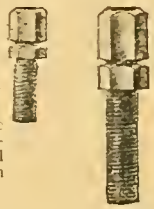
No. 427.
For side of bar. The Ratchet provides six positions. 7/6 Levers only.

PORTABLE CLIP.

For attaching lever to round tube. In all sizes.
2/- each.

STOPS, with Lock Nuts.

For use with Bowden Wire Mechanism. When ordering give number and description of wire with which stop is to be used.
Price from 4d. each.



BOWDEN RAPID VALVE GRINDER.

Helps you to grind a valve quickly and with absolute accuracy without dismantling cylinder. The most efficient valve grinder made.

Price 7/6

When ordering send remittance to cover cost of postage—any balance will be refunded.

NEW-HUDSON

MILITARY SERVICE MODEL

as supplied to His Majesty's Forces, H.M. Postmaster General, and the Indian Expeditionary Force.

Also to

The Russian Imperial Govt., The French War Dept., The Belgian Government, and the Italian Government.

This special model embodies 1915 practice throughout. Exclusive in design; perfect in construction; highest quality equipment.

It represents the latest development of the 500 c.c. solo machine—a combination of the famous New Hudson 3½-4 h.p. engine with counter-shaft three-speed gear, motor car type, built into a frame of approved design and unequalled sturdy construction.

Accessibility is exemplified by a new and important feature—the removable power unit. This power unit includes the engine, magneto, carburetter, three-speed counter-shaft gear, free engine clutch, and kick starter, all assembled as one unit to fit into frame *en bloc*

Special heavy wheels with Dunlop heavy studded tyres, H.T. magneto, B. & B. carburetter, Brooks pan-seat saddle, comfortable footboards, efficient mudguarding, extra large tank, and complete Service kit of high-grade tools. Service grey finish.

Price £57 10s. net.

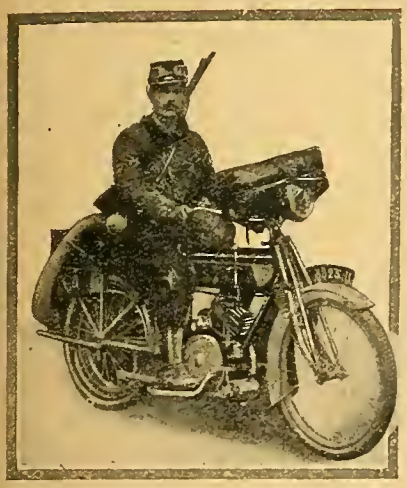
AGENTS EVERYWHERE.

In answering this advertisement it is desirable to mention "The Motor Cycle."



A FRENCH MILITARY MOTOR CYCLIST.

M. J. Linde, a rider of a two-stroke Clyno, who is etat major to the staff of the 6th Army Corps of the French Army. His Clyno is fitted with Harcourt radiators, and its running is greatly admired by his fellow soldiers.

Of Interest to Buyers.

The annual Buyers' Guide of *The Motor Cycle* is an invaluable work of reference. It contains the full specification of every motor cycle of note on the British market. The 1915 Guide will be published on Thursday, November 19th.

A Dearth of Motor Cycles in Russia.

A correspondent from Moscow writes that no more motor cycles are to be seen in the streets of that city, as all, including his own, have been commandeered by the Russian War Office.

Italian Imports and Exports.

The Italian imports and exports of motor cycles during the month of August for the last three years are as follow: Imports: 1912, 163 machines; 1913, 247 machines; and 1914, 160 machines. Exports: 1912, 11 machines; 1913, 11 machines; and 1914, 7 machines. The imports for last August are not only lower than in August, 1913, but are far below the general monthly average of the present year, which works out at 535 machines per month. This drop is due, of course, to the war.

An Interesting Incident.

The other day three Scott sidecar machines were seen wending their way through St. James's Park. They were specially adapted for military purposes, and enquiries elicited the fact that they were on their way to Buckingham Palace for the purpose of being privately inspected by His Majesty the King. They were in charge of Mr. A. A. Scott, their designer and inventor, who drove one of them, while the others were driven by Norman Longfield and F. A. Applebee.

As far as we know this is the first occasion on which the King has shown a special interest in motor cycles, and consequently the Scott Engineering Co. has been highly honoured.

A Place to Avoid.

A writer warns us of police activity at Bidford-on-Avon, Warwickshire. Action is immediately taken against riders of machines which the constable thinks are at all noisy, and if a motor car or motor cycle be left outside an hotel more than five minutes there is again trouble. Our informant says that local motorists are going roundabout ways rather than pass through the village.

Profits of a New Company.

The directors of A. J. Stevens and Co. (1914) report a profit for the year ended August 31st of £7,437, of which £924 is in respect of profits made since the formation of the company. The liability of £4,100 to the vendors and the purchase price for the site of the new works have now been discharged.

A DUTCH MILITARY MOTOR CYCLIST.

F. de Prey, a Volunteer military motor cyclist in the Dutch Army, who reports having covered 4,500 miles on military service on his 4 h.p. Triumph with an entire absence of trouble.

American News and Views.

Last week Mr. W. H. Wells returned from the United States, where he has been inspecting the 1915 Indian models. He crossed over on the *Mauretania*, almost unrecognisable in her garb of battleship grey, and all along the route many British cruisers were seen. Mr. Wells was not particularly enthusiastic about the uniform scheme of decoration which had been adopted for the Chicago show, the result of which, he said, was extremely flat and uninteresting. The general appearance as a whole, he considers, was far below what we are used to seeing at the Olympia Show. The opinion is generally expressed in America that the English manufacturers have made a great mistake in abandoning the show this year. Mr. Wells further told us that there appeared to be great interest taken in the exhibits shown in Chicago, agents from all parts of the United States and Canada being in attendance, and he was told that very large orders were booked by the three principal manufacturers.

A Thoughtful Present.

We have received from a reader (Mr. E. Gaunt, of Coseley, near Bilston, Staffs) a suit of overalls, which he asks us to present to some despatch rider in His Majesty's service.

Sheppey Roads Closed.

By a new Government Order a pass is required before being allowed to enter Isle of Sheppey from the only approach from the mainland — Queensbridge. Certain roads in the Isle of Grain, near the naval and aero stations, are closed to traffic.

Killed in Action.

We greatly regret to announce that S. N. Crowther, M.R.C.S., L.R.C.P., who was employed as a despatch rider, was killed in action on the 18th ult. Dr. Crowther was senior medical officer of Surrey County Asylum, and formerly senior house physician at Westminster Hospital; he was a keen motor cyclist.

Christmas Gifts for Despatch Riders.

As we announced last week, H.R.H. Princess Mary's Christmas Present Fund has exactly the same object as the shilling fund announced by *The Motor Cycle* a fortnight ago, and, consequently, should receive wholehearted support by motor cyclists in general. In view of the difficulties of distribution, it is feared that it will be impossible to devise a form of gift to be particularly applied to motor drivers, which *The Autocar* and *The Motor Cycle* urged.

Reliability Trial in Denmark

A trial over a distance of 350 km. was held by the Motor Club of Copenhagen (the largest club in Denmark) recently, and it was notable for the fact that it was the first trial in which a lady motor cyclist figured. There were fifty competitors, all being sent off in pairs in order to check one another. Only twelve pairs finished the trial with full marks, and the pair adjudged first were Miss Werner, who rode a 2½ h.p. Hobart machine, and C. Walter, who drove a 7 h.p. Indian with Canoelet sidecar.

C. Walter (7 h.p. Indian and Canoelet sidecar) who with Miss Werner (2½ h.p. Hobart) formed the winning pair in the Motor Club of Denmark's reliability trial

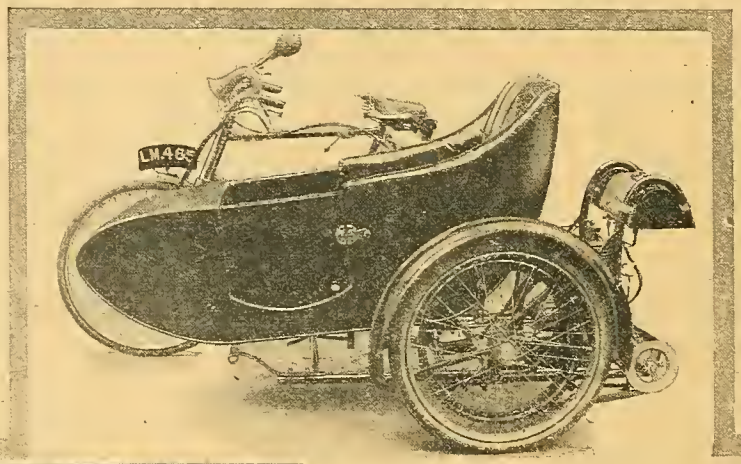
THE AUTO-SIDECAR.

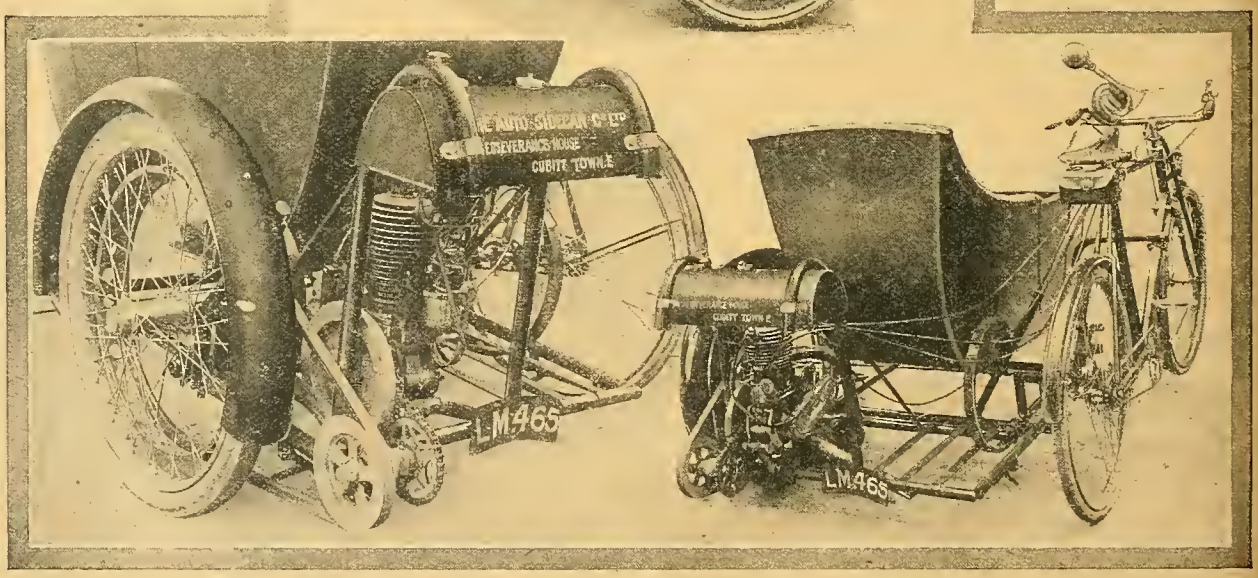
SINCE the Auto-Sidecar, made by the Auto-Sidecar Company, Perseverance House, Cubitt Town, E., was described in our issue of October 1st, various alterations have been made in its design. These are clearly evident in the accompanying illustrations, from which it will be seen that the sidecar frame has been very much improved and strengthened, while another important change is the fitting of a really effective mudguard of ample width and provided with a deep valance on its inner side. Further, a body of pleasing outline has been fitted by Messrs. Purcells, 78, Charlotte Street, W. Hinged legs for the purpose of jacking up either the sidecar or pedal cycle wheel are fitted to the longitudinal members of the frame, thus acting as an efficient jack. We understand that in the near future an expanding pulley will take the place of the fixed pulley, so that some means of varying the gear will be provided, and the petrol tank will be cylindrical in shape.

Before we tried the Auto-Sidecar it did not seem possible that the diminutive little engine would develop anything like sufficient power to propel the required load at a steady speed of 12 to 15 m.p.h. However, this was the case, and it was only on fairly steep gradients that a little pedal assistance was necessary.

Practically No Vibration.

At first sight one would imagine that the sidecar passenger would feel a certain amount of vibration owing to the way in which the engine is mounted, but in actual practice all tremor caused by the engine is effectually damped by the springs and upholstery of the sidecar. It is difficult to make the sidecar lift on corners owing to the weight of the engine and low speed obtainable. Turning to the point of view of the cyclist, there are many little advantages which accrue from such a design. Perhaps the foremost of these is the fact that special overalls can be dispensed with on good roads and in fine weather, as there is little possibility of getting oil stains on one's clothes, and both driver and passenger are seated well away from the noise. Naturally, the attachment is not intended to take the place of the more powerful sidecar combination, nor is it meant for serious touring, but rather to provide a leisurely means of getting about for the potterer in not too hilly country.



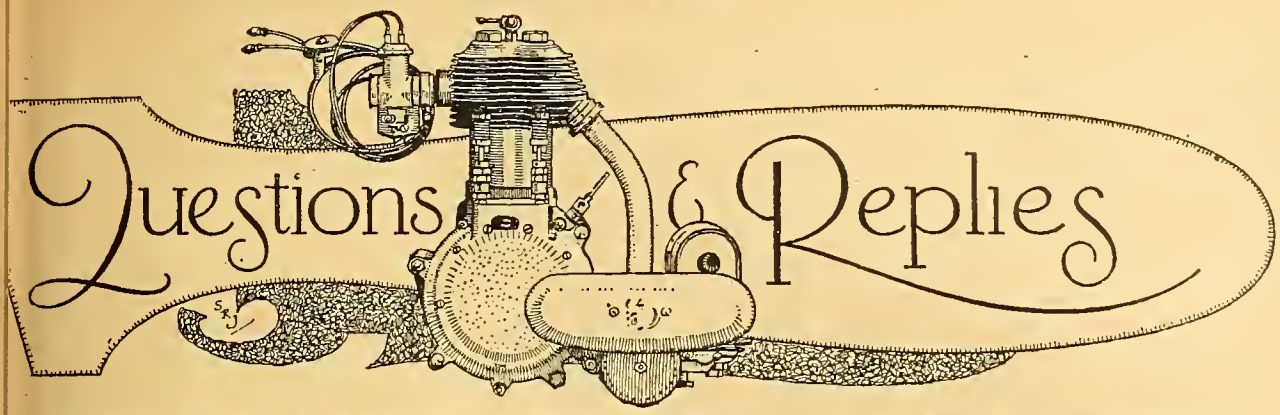


Various views of the latest Auto-Sidecar, detail improvements of which are described above.

TWO SPECIAL ISSUES OF "THE MOTOR CYCLE"

are in course of preparation Both will be considerably enlarged and profusely illustrated In the absence of the Show they are bound to be in great demand, and early orders should be placed with newsagents

ANNUAL BUYERS' GUIDE ON NOV. 19th. EQUIPMENT NUMBER ON DEC. 10th.



Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fires on One Cylinder Only.

Can you help me with my 5 h.p. twin, as I am quite lost how to find what is wrong with it? It only fires on the front cylinder. The magneto is in order, valves timed correctly, plugs good; in fact, I have tried several. The engine has automatic valves. I have even changed valves over, but all that made no difference. I have not looked at timing wheels, but they must be all right or the valves and timing would be wrong.—E.J.P.

Are you sure that the carbon brush conducting the high-tension current from the magneto to the front plug is working satisfactorily and not sticking? Is the contact breaker arm quite free? You should also see that the valves are working well in their guides, and be careful to see that there are no air leaks in the induction pipe. If the timing of the valves is correct the fault cannot well be in the timing gear. The trouble is one which is very difficult for us to diagnose without actually seeing the machine.

Building a Cycle Car.

I intend building a small monocar this winter, and am writing to ask if you will be good enough to give me some idea as to what power engine I should fit into it. The framework, body, axles, wheels, etc., when fitted together will weigh, I imagine, about 120 to 130 lb. *minus* the engine. Would motor cycle road wheels be strong enough, such as fitted to big twin-cylinder machines? I live in a fairly hilly country, and weigh about twelve stone. I see a number of second-hand engines advertised, but in order to have reliable running, it might be better to get a new one. Kindly say what your opinion is as to this.—I.M.C.

We should recommend you to fit the vehicle with a two-cylinder engine, preferably water-cooled, of not less than 6 h.p. Very strong motor cycle road wheels could be fitted, and 650 × 65 tyres. You will, of course, need some efficient form of change speed gear and clutch. We should advise you to have a new engine in preference to a second-hand one.

Two-stroke Lubrication.

A friend of mine has recently bought a two-stroke motor cycle, 2½ h.p., and he is experiencing trouble with oil being thrown out from the carburetter. I saw him recently, and his overalls on the right leg were spattered with oil after doing only a few miles. I had thought of making a similar purchase, but if the two-stroke generally has such a fault I certainly shall not buy such a machine. I shall be obliged if you will explain in *The Motor Cycle* the cause, and also if the Bradbury and New Hudson are perfectly clean in this respect. I presume such a fault can be remedied? Can you recommend the two-stroke as being a clean machine to ride?—A Regular Reader.

There are several possible causes for the excess of oil being thrown out. You do not tell us the system of lubrication employed, and this is rather an important point. However, if a mixture of petrol and oil is used the probabilities are that too much oil is being mixed with the petrol, or the top piston ring is gummed up in the piston, and a certain amount of blow back is taking place. All two-strokes lubricated by this system will leave an oily deposit on the carburetter, but this should not reach the driver's leg. Either gauze or a metal shield is almost invariably fitted to the carburetter with the idea of preventing this. From the symptoms mentioned, however, we take it that too much oil is being used. About half a pint of thin lubricating oil, such as Huile de Luxe, should be used with every gallon of petrol. You do not mention what type of Bradbury or New Hudson you require details about. The Bradbury Co. do not at present make a two-stroke machine, but their four-stroke machines are perfectly satisfactory and clean. The New Hudson Co., on the other hand, make both two-stroke and four-stroke machines, both of which are quite satisfactory. We have been running two two-stroke machines throughout the year, and in regard to cleanliness of one's clothes we have seldom ridden machines more perfect in this respect, in spite of petroil lubrication.

FORTHCOMING
SPECIAL ISSUES OF
THE MOTOR CYCLE
November 19th.
BUYERS' GUIDE OF 1915 MODELS
December 10th.
EQUIPMENT NUMBER.

General Debility of a Twin.

I should be much obliged if you could assist me by suggesting a remedy for something which has gone wrong with my machine. When I change over, even on the level, from low to high gear the engine begins to slow down, and I have to come down on to low gear, perhaps half a dozen times before I can get running. On hills, which previously were of no account, I have to change down. The plugs are all right, both cylinders fire properly, compression is good, and the controls appear to work properly. If I advance the spark it seems to have no effect.—H.S.

We should say that what your engine requires is a thorough cleaning. Remove cylinders, and clean all carbon from the cylinder heads, the tops of the pistons, and especially from the valve ports. Put about half a pint of paraffin into the crank case and swill this about for a few minutes, turning the crank round two or three times, then drain out by means of the plug at the base, and put in two to three charges of fresh oil. Take off the carburetter and carefully clean every part, making sure that the jet and petrol pipe are not in any way obstructed. It is also possible that the magneto requires some adjustment. The platinum points should separate .4 mm. and no more, and they should be smooth and clean. It would also be as well to remove the terminals and clean both them and the slip ring with a rag dipped in petrol sufficiently to make it just wet, repeating the operation till all dirt is removed. The silencer and exhaust pipe too should be cleared of soot and carbon.

Slow Running.

I have just purchased a new Scott motor cycle. Would you be good enough to tell me why I cannot run it on top gear at less than about 18 m.p.h. without its jerking and knocking? It is fitted with Binks carburetter, and I have tried altering the jets without success. The same thing happens on low gear at anything less than about 7-8 m.p.h. My turnout, which I use in Southern India, has to be lifted, carried, etc., sometimes five to six times in a day from trains, ferries, and bullock carts, sometimes *in toto*, sometimes with the machine and sidecar separate. I want to get fitted, if possible: *(a)* a locking device, to keep the front wheel from veering while the machine is being lifted; *(b)* some kind of handles to catch hold of, especially in front, for the coolies to handle it easily.—J.C.P.

We think you will find considerable improvement if you take down the gauzes in the transfer ports and either boil them in strong soda water or brush them with a stiff brush soaked in paraffin. Be also very careful to see that there are no air leaks in the induction pipe or carburetter, and that the washers round the gauzes are in good order. A steering lock and suitable handles for catching hold of the machine would have to be made specially for you, as in the case of the former there are none suitable for motor cycles. The design adopted for a pedal cycle would be good if the device were made suitably strong. There is, however, a certain amount of danger, as in the event of starting the machine with the head locked a serious accident would result, and accidents with pedal cycles have often occurred from this cause. A friction lock would therefore be best. Any ingenious man would fit wooden handles, fixed on brackets attached to suitable parts of the framework or to the sides of the forks of the machine.

Local Taxation Licence.

A fortnight ago I purchased a second-hand motor cycle. The previous owner had paid the tax for the year. I have taken out a driving licence and have had the registered number transferred to my name. (1.) The tax on the machine having been paid, is it necessary for me to pay again as from October 1st? (2.) Is the individual taxed or is it the machine that is taxed? (3.) Would an owner having two or more machines have to pay two or more taxes?—G.B.

(1.) Yes; it is necessary to take out a licence, which can be done at half fees (10s.), as you did not possess the machine till after October 1st. (2.) The local taxation licence applies to the owner, not to the machine. (3.) The local taxation licence entitles a man to keep one motor bicycle; therefore, if he has two he must have two taxation licences. If he sells one machine and buys another, and does not use the two while in his possession, one tax is sufficient.

Irregular Running.

Would you kindly inform me of the correct timing for a 1912 twin Moto-Rêve? I have had the magneto repaired, and on refitting it I can only get it to fire on one cylinder (front) regularly; the back one only gives a few explosions, but the funny part about it is, on moving the inlet valve from the front to the back, it fires on the back and not on the front. The inlet valves are quite free in their guides, but the springs are different lengths. I get a good spark at both plugs, and I have tried various jets.—W.V.

The correct timing is as follows: Set the magneto points about to break with the piston dead at the top of the compression stroke, and the spark retarded if an advance spark mechanism is fitted. The trouble is obviously due to the inlet valve. It is important that the inlet valve springs should be, as nearly as possible, of the same length and tension and the amount of opening of each valve should be the same. The springs should be tested by pressing the stems together and noting whether the lift is the same in the case of each valve.

Age Limit for Licences.

I am anxious to get a motor cycle next year, and I am only 15. Do you think it is possible to get a licence?—J.S.G.

You will have no difficulty in obtaining a licence to drive a motor cycle. The age limit is 14 years, and in the case of a motor car 17 years.

Sidecars and Single Gears.

I have a 3½ h.p. Triumph, 1912, free engine clutch model, single geared, 5¼ to 1, and often use it with a sidecar. I have recently purchased the machine, and the engine works well, but, owing to the single gear I presume, it is quite impossible for me to climb any really steep hills with a passenger. Blackheath Hill, Shooters Hill, and Castle Hill, Dover, and many other steep grades proved hopeless on a recent trip to Dover. My weight is eleven stone eight pound, and my usual passenger weighs nearly the same, although sometimes I only have an eight stone load. If I had a variable gear fitted, should I be able to climb practically any hill with sidecar and passenger, and if necessary start up with full load on a gradient?—B.W.F.

If you had a variable gear fitted you would be able to climb any one of the hills mentioned with ease, and, if necessary, start up with full load on the steepest gradient of such hills; in fact, a sidecar machine without a change speed gear is not likely to be much use for serious touring. You may fit a Bowden, or some such gear, which is made so as to be easily fitted to a machine such as yours, or a three-speed hub.

THE LOYALTY OF MOTOR CYCLISTS. A rally of Toronto motor cyclists which led up to recruiting for the Canadian Field Force. The machines are of British and American origin.

READER'S REPLY.

Red-hot Exhaust Pipes.

With reference to "W.M.M.'s" query in *The Motor Cycle* of October 15th, I suggest that the reason his exhaust pipe gets red hot is because his exhaust valves want grinding. My exhaust pipe on my 5-6 h.p. Rudge-Multi invariably gets red hot when the valve wants grinding in; why, I cannot say, but a little grinding powder, a brace, and ten minutes good "elbow grease" never fail to cure this effect, although, as "W.M.M." remarks, it never interferes with the running of the engine, and does not, therefore, really matter.—C.H.R.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.B." (Preston).—Folding sidecars. Reliability and ease of manipulation, etc.

"L.M." (Kidderminster).—Mabon variable gear. Wear of belts and general efficiency.

"S.C.R." (U.S.A.)—Reliability and durability of sidecars fitted with disc wheels.

MOTOR CYCLES FOR SALE.

Brown.

2½h.p. Brown, Precision, 1912, with spares; £18.—68a, Delancey St., London, N.W. [8408

3½h.p. Brown, battery and coil ignition, good tyres; £10.—J. Eyre, Brough, Bradwell, Sheffield. [X2353

Brough.

BROUGHS.—Immediate delivery from stock of the 500 c.c. horizontal twin 2-speed overhead valve models.—The West Lancashire Motor Co., Southport. [0555

BROUGH, 1914, 3½h.p., horizontally opposed 2-speed twin, condition absolutely as new, picked engine very fast and powerful, won gold medal last London Edinburgh, hardly ridden since; stringent expert examination invited; £40, a real bargain.—Lovegrove, Roesmore, Wharncliffe Rd., Boscombe. [8011

Calcott.

1913 2½h.p. Calcott, variable jet, B. and B., Bosch, lamp, horn, tools, Dunlop tyres, belt, done 1,000, as new; £26/10.—Brownridge, Hungerford Rd., Crewe. [X2309

Chater-Lea.

CHATER-LEA, 3½h.p. J.A.P., C.A.V. carburetter, good condition, sidecar; £12.—Blake, 216, Westbourne Grove. [8325

2¾h.p. 2-speed Chater-Lea 2-stroke Motor Cycles for immediate delivery from stock, £36; exchange or easy terms at Wanchope's, 9, Shoe Lane, London. [X2372

1912¾ No. 7 Chater-Lea, 8h.p. J.A.P. engine, 3-speed gear box, with 20 gn. coachbuilt sidecar, F.R.S. lamp set, heaps of spares, condition as new; £43.—Burke, 80, Rutland St., Stepney, E. [8520

CHATER-LEA, 1913, No. 7, 8h.p., 3-speed gear box and clutch, chain drive, cane sidecar, Dunlop voiturette tyres, splendid order; cost over £120, new last year; bargain, £54, or extended terms arranged.—Elce and Co., 15, Bishopsgate Av., Camomile St., London, E.C. [0597

Clyno.

CLYNO, 1913, 3-speed, with sidecar; £38.—Huskard and Mitcham, Curzon St., Derby. [X2392

1913 6h.p. Clyno Combination, 3 speeds, chain, kick start, run 900 miles; £49.—Blencathra, Highfield Rd., Walton-on-Thames. [X2345

1914 Clyno Combination, done 900 miles, complete accessories, splendid lot; £80, or near offer.—H., 19, Grimwood Rd., Twickenham. [8518

CLYNO, 1914 (July), 2-stroke, 2-speed, Jones speedometer, Dunlop tyres, accessories, ridden 2,000 miles, perfect; £35.—1, Ovington Gardens, S.W. [8584

CLYNO, 6h.p., and coachbuilt sidecar, just been thoroughly overhauled, speedometer, and spares; going away; no reasonable offer refused.—H. Fitton, 159, Luck Lane, Paddock, Huddersfield. [8407

Condor.

FIRST £3 gets 1909 2h.p. Condor, re-enamelled, new tyres and tubes, and battery, less carburetter, splendid condition.—Higgins, Argoed, Mon. [X2292

Connaught

BRAND New 2-speed Connaught, 1914; £35.—Huskard and Mitcham, Curzon St., Derby. [X2391

1914 Connaught 2-stroke, powerful, 2¾h.p., as new, all accessories; £26, or exchange anything.—8, Leslie Rd., East Finchley. [8491

CONNAUGHT, 1913, 2¾h.p., 2-stroke lightweight, new non-skid back tyre, perfect condition; £18.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0610

Corah.

CORAH-J.A.P., 1912, 4h.p., T.T., Grade-multi gear, new Dunlop belt, electric lamp, spare valves, accessories, in splendid condition; 35 gns.—141, King's Rd., Camden Town, N.W. [X2243

Dot.

DOT, 7-9h.p., torpedo sidecar, cheap quick purchaser.—Wilkinson, 126, Buchanan St., Blackpool. [X2358

Douglas.

DOUGLAS, 1911, 2-speed, free engine; £18.—J. Middleton, Elvet Bridge, Durham. [X2320

DOUGLAS, 1915 models, for almost immediate delivery.—The Morris Garages, Oxford. [8568

1913 Douglas, 2¾h.p., 2-speed, splendid condition; £33.—39, Heathwood Gardens, S.E. [X2418

1915 Douglas, all models, immediate deliveries.—Clifford, Motories, Eastwood, Notts. [X2153

1910 Douglas, perfect running order, good appearance; £15.—Bishopbrigg, Crown St., Carlisle. [8509

DOUGLAS, 1913, 2 speeds, all accessories; £30.—Smith, Langworth, Headington, Oxford. [X2310

1912 Douglas, 2-speed, clutch, genuine mount; £27/10.—53, Brownhill Rd., Catford. [8479

DOUGLAS; all models supplied, cash or easy terms.—Turpins, 22 and 29, Preston Rd., Brighton. [0509

DOUGLAS, 1911, excellent condition, lamp, horn, etc.; £15/15.—Neighbour, c/o Gardam's, Staines. [8475

DOUGLAS, 1913, 2¾h.p., T.T., 2 speeds, exceedingly fast; £30.—P. J. Evans, John Bright St., Birmingham. [8588

CORONET SIDE CARS

A few shop-soiled models cheap. Your old sidecar taken in exchange.

T.T. Douglas, late, speeds, for 1913 F.E. Rover, cash either ways.—Riseley, Harrold, Bedfordshire. [8478

WANTED, good motor cycle, must be cheap.—W. Norman, Greyhound Lane, Streatham, S.W. [8501

CHATER-LEA 3-speed Gear Box, any condition; cheap.—Hudson, Grand Hotel Buildings, Eastbourne. [8440

4h.p. Single or Twin, J.A.P. or Precision, m.o.v., slight repairs no object.—Beattie, 48a, Belmont St., Southport. [X2294

WANTED, magnetos, carburetters, lamp sets, speedometers, tyres, belts.—Star Co., 64, Gt. Portland St., W. [8602

MAGNETO, anti-clockwise, 3½h.p., single, also counter-shaft speed gear; cheap.—Schofield, Ainsdale, Southport. [X2331

WANTED, modern sidecar combination and cash for 15h.p. Flanders, 2-seat., value £90.—Palmer's Garage, Tooting. [8486

MOTOR Cycle, suit tradesman's carrier, magneto, speed gear, free engine; cheap; no rubbish.—Schofield, Ainsdale, Southport. [X2330

WANTED, magneto motor cycles, must be cheap; state lowest price.—Box No. 6,836, *The Motor Cycle* Offices, Coventry. [X2342

BRADBURY Cylinder and Piston, 1911, for 3½h.p.; good condition; approval.—Smallwood, 18, Park Rd., Moseley, Birmingham. [8421

WANTED, 1914 Morgan sporting; 9h.p. Turner petrol car, 1912, part payment.—Evans, Mill Lane, South Kirkby, Wakefield. [X2370

WANTED, 2 or 3-speed gear, also lamp set, speedometer, good saddle, and motor cycle accessories. Cheap.—125, London Rd., Manchester. [0560

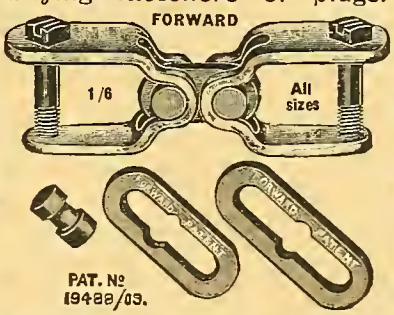
WANTED, strong roomy sidecar, good condition, to fit 7h.p. Hendee Special.—Lowest price and make, Schofield, 25, Beverley Rd., Bolton. [X2258

WANTED, twin 8h.p. air or water-cooled engine, J.A.P. or Blomfield preferred; would exchange 1914 Connaught.—H. Salsbury, Sydney Rd., Guildford. [8512

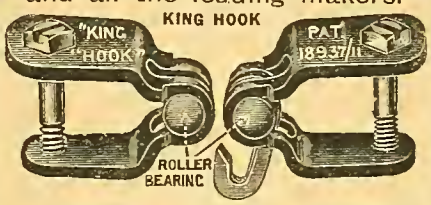
WANTED to Purchase, motor bicycles, light cars, or cycle cars for cash down. — Write, Box 6,190, *The Motor Cycle* Offices, 20, Tudor St., E.C. [7584

"FORWARD"

The name to remember when buying fasteners or plugs.

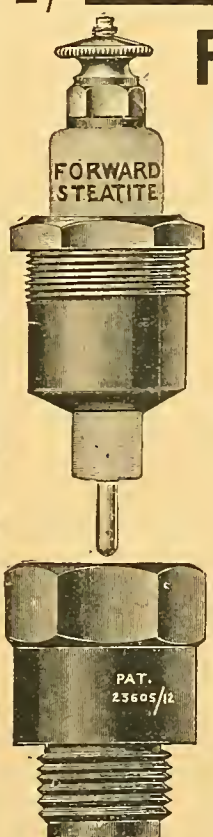


As fitted by Messrs. Triumph and all the leading makers.



The strongest & longest lived hook fastener yet invented.

1/- DETACHABLE. Adjustable Hooks, **3d.** extra.



Forward BRITISH PLUGS—

Made in a dozen types to suit all purposes, from **2/-** ea.

Send for List

Type D,

Illustrated.

Instantly taken apart for cleaning.

No Asbestos Packing.

Absolutely —and— Permanently Gas - tight.

3/6 each.

Forward Motor Co., Summer Row, — B'ham

WANTED.

DOUGLAS or Indian Motor Cycle wanted in part exchange for A.C. car.—Write or call, Auto-Carriers (1911), Ltd., 15, Little Portland St., W. [8455

SPEED Gear for Bradbury; exchange 1½×2in. slide valve steam engine, with 2×1ft. coal-fired copper boiler, all gauges, tested 30 lbs. sq. in.—Abbott, Hockin, Hayle. [8574

WANTED, any number of motor cycles, combinations, light cars, sidecars, engines, accessories. We buy, sell on commission, or exchange. We have several clients waiting for good machines. Send us particulars. We have the largest clientele, the finest salerooms, and obtain the highest prices; terms, testimonials, etc., on application.—Morgan and Maxwell, London Motor Salerooms, 80, High Rd., Streatham, London. [X9559

EXCHANGE.

V.S., 5h.p., for good single; offers.—91, Melbourne Rd., Eastbourne. [X2355

1911 Motosacoche, £15, for good 3½h.p., free engine. —36, Gold St., Wellingborough. [8500

MOTOR Launch for motor cycle and sidecar.—Dromana, Bernard Rd., Cowes, I.W. [X2253

EXCHANGE 3½h.p. F.E. Triumph for 2-stroke lightweight; particulars.—Mansell, A.S.C., Colchester. [X2032

3½h.p. Raleighette and 3-speed Lady-back Tandem for small car.—Dorrell, Baker, Croxley Green. [X2377

VIOLET Bogey Cycle Car, like new, cost £125, 1913; exchange combination.—80, Bispham Rd., Southport. [X2327

1913 Lightweight, Martini rifle, revolver, cash, for 3½ to 6h.p.—Hedger, 14, Nelson St., Southend, Essex. [X2308

1913 7-9h.p. 2-speed Red Indian; exchange for T.T. Douglas 2-speed.—Jagger, Fish Merchant, Bradford. [8443

EXCHANGE Good Sidecar Combination for cycle car, any make, cash also paid.—Palmer's Garage, Tooting. [8482

GOLD Watch and Chain and Raleigh 3-speed, for motor cycle, Douglas preferred.—113, Moy Rd., Cardiff. [X2245

1912 Clyno, coach sidecar, hood, screen, spares; exchange solo and cash, sell £32/10.—50, Wetherell Rd., S. Hackney. [8556

CLYNO, 6h.p., and sidecar, just been overhauled, for lightweight; any trial.—H. Fitton, 159, Luck Lane, Paddock, Huddersfield. [8407a

CYCLE Car wanted; exchange 1914 Rover, Millford combination, hood and screen, not done 2,000.—Avery, Draper, Bexhill. [8595

EXCHANGE 1914 Connaught, guaranteed, for 8h.p. twin engine for cycle car, or sell £22.—H. Salsbury, Sydney Rd., Guildford. [8513

MATCHLESS 8h.p. Combination, scarcely soiled; exchange lower power and cash; sell cheap.—156, Ladypool Rd., Birmingham. [X2252

3½h.p. Empire, Sturmey-Archer gear, Binks, £30; nearest offer over £20, or exchange lightweight. —Slater, Wood's Lane, Derby. [X2389

EXCHANGE 1911 3½h.p. F.E. Premier, everything splendid condition, for 4-cyl. F.N.—Particulars to Chapman, 172, Poulton Rd., Fleetwood. [X2262

1913 3½h.p. Premier, 3-speed, splendid condition, for 1913 2-speed Douglas or Levis, or sell £35.—Bailey, Oakdene, Shaw Cross, Dewsbury. [X2371

EXCHANGE 6h.p. 1912 Zenith and sidecar, lamp and speedometer, splendid condition, very fast, for Morgan.—G. Fletcher, Headford Hill House, Yeovil. [X2285

RUDGE, 1911, splendid condition, and cash adjustment, for 1913 2-speed T.T. Douglas; sell £19.—Monkswood, Monkhams Lane, Woodford Green, Essex. [X2324

EXCHANGE 1911-12 4¼h.p. twin combination, speed gear, Cowey, splendid condition, and cash, for higher power.—Viccars, 55, Woodside Green, South Norwood. [8557

EXCHANGE 7h.p. 1914 combination, lamp, horn, speedometer, cost £85, only run 600 miles, for light car, cash adjustment.—Newnham, 223, Hammersmith Rd., W. [8466

6h.p. Rover, 2-seat., 2 ignitions, hood, screen, Stepney; exchange for late model Triumph or Douglas, or sell 30 gns.—Geo. Male and Co., 36, Parade, Leamington. [X2399

RUDGE, 1913, N.S.U. 2-speed, coach sidecar, also a ¾ size Ryley billiard table, nearly new; will exchange both for twin Indian.—Webb, 73, Salmsbury Rd., Kilburn, London. [8542

CHASSIS, Radiator, Engine (genuine De Dion), 5h.p., 2-speed gear, wheels, tyres, front axle, steering wheel and brake rods, almost everything except body; Binks 2-jet carburetter, automatic, 15/-; 2 accumulators and trembler coil, 7/6; 1 pair Minerva spring forks, 6/-; exchange lot for motor cycle. Wanted, 2 or 3-speed gear for motor cycle.—Hodson, 47, High St., Spennymoor. [X2254

REPAIRERS.

MORGAN and Maxwell, Streatham, for cheap, quick, good repairs. [X2397

VALVES.—Nickel steel valves, any size, 3/6; per pair 6/-.—C. R. Foster, Kirkstall Rd., Leeds. [0253

E. S. MYERS BRADFORD

"MYERS" SIDECARS.

Of Great Interest to Scott Riders.

The "**MYERS**" Sidecar (Scott's patent) has been specially designed for Scott machines, and is the only scientific proposition on the market; double the strength and half the weight of almost any other make.

Write for Illustrated Booklet.

NO WORRY SERVICE

REPAIRERS.

ANTOINE Cylinders, pistons, and parts; prompt delivery.

CYLINDERS, crank cases welded; quotations free.

COMPRESSION.—Cylinders ground and new piston fitted, 24/-.

OLDEST Engines Restored to highest vitality

COMPLETE Overhauls at lowest possible prices. Full stock of Rex, Triumph, and J.A.P. parts.

COUNTER-SHAFT Gears.—We can now quote the trade for our Rex-J.A.P. 3-speed gear at inclusive prices, including fitting to old machines.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0246

ALUMINIUM Crank Cases, gear boxes, etc., repaired neatly and promptly without distortion.

WELDING Broken Cylinders, pistons, flanges, lugs, frames, and a thousand other things repaired and guaranteed by Weldings, Ltd., 37, Holt St., Birmingham. [8030

WHITTALL Machinists' Co., War Office Contractors, for all repairs.

WHITTALL.—Expert welders; repairs returned, accurately machined, inside 7 days. No charge if unsuccessful

WHITTALL.—Re-boring and new pistons. All motor repairs. Old engines rejuvenated. All work guaranteed; no exasperating delays.—Whittall Machinists' Co., Whittall St., Birmingham. [0136

WELDINGS, Ltd., Dept. M.C., 235, Gt. Ancoats St., Manchester.—Oxy-acetylene welding experts.

BROKEN Flanges, valve seats, pistons, crank cases, water jackets, welded and machined complete.

SEND Your Old Engines or complete machine for overhauling, re-bushing, cylinders re-ground, new pistons, rings, and gudgeon pins fitted.—Weldings, Ltd., Dept. M.C., Manchester. [6234

EXHAUST Valves for any make engines, guaranteed, nickel steel, 2/6, to pattern.—3, Park St., Leamington. [X2338

CYLINDERS, Crank Cases welded; quotations free; send your enquiries.—Premier Motor Co., Aston Rd., Birmingham. [0248

OXY-ACETYLENE Welding, first-class work; moderate quotations.—Purcells, 78, Charlotte St., Tottenham Court Rd., W. [6750

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-Acetylene Welding, 349, Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

WELDING.—Broken cylinders, flanges, pistons, crank cases repaired and machined; worn valve seats built up, cracked seatings welded and machined.

CYLINDERS Re-ground, new pistons fitted complete, worn parts duplicated.—West London Welding Co., Essex Place, Chiswick. Tel.: 536. [7104

CCCCCCCCC Cylinders Re-bored, new pistons fitted, bear 13 stone on compression.—Gradior Machine Co., Compression Specialists, Stafford. Est. 21 years. [7314

MINERVA Spares, cylinders ground, pistons fitted, re-bushing, parts duplicated. — Ellenborough Motor Works, Ellenborough Rd., Wood Green, N. [8394

PISTONS, fitted with top and bottom step-cut rings, hardened steel gudgeon pin, and your cylinder re-bored and ground, 24/-.—C. R. Foster, Kirkstall Rd., Leeds. [0310

EVERY Repair is guaranteed; every repair is machined ready to fit; every repair has immediate attention; and everybody sends to Weldings, Ltd., Holt St., Birmingham. [8031

CYLINDERS Re-bored and Ground on special machinery, prices from 15/-, complete with piston, gudgeon, and rings, accuracy guaranteed.—Motor Repair Co., Stretford. [X2381

FRAME Alterations.—Triumphs, Rexes, Minervas, or any make cut down and modernised; smartens the appearance, adds pounds to value of machine, and gives 4 to 6 inches lower riding position. Estimates free.—Below.

ENGINE Efficiency.—Cylinders re-ground, new pistons fitted; highest efficiency and skilled workmanship guaranteed; phosphor bronze bushes from 2/6; valves and seatings ground true, 5/- pair; estimates submitted.—Patricroft Motor Co., Patricroft, Manchester. [8378

UNBREAKABLE Chrome-nickel Valves. — Numerous testimonials prove superiority. Guaranteed one year. Any make, 3/6 each, 6/- pair, free per return.—Capacity Tool Co., Broseley, Shropshire. [X0693

TONGE Welding Works, 174, Oldham Rd., Middleton, Manchester.—Experts in broken cylinders, crank cases, etc. Welding aluminium a speciality. Nothing too difficult. Sound work at moderate charges. [1389

"SCILKA"

THE NEW MASCOT FLAG MATERIAL.

Wearing Quality Unsurpassed.

Superior to Silk—which frays quickly. "SCILKA" Flags are printed with fast dyes and can be washed when required.

NOTE THE LOW PRICES. We Defy Competition.

Union Jacks, French, Russian, Belgian, Servian, and Japanese.

Bred in Peace but Invaluable in War.

THE motor cycle was originated and developed entirely for peaceful purposes, yet there is no modern invention which has more readily lent itself to warlike uses. From the moment war began our columns have been a continuous record of the uses to which motor cycles have been put in warfare, and of the smart and gallant deeds of many motor cyclists in the real thing. Indeed, the way in which the man and the machine have lent themselves to the stern conditions of warfare in its most terrible forms is remarkable, and all who have borne any pioneer share in the motor cycle movement have reason for some little pride that the movement they helped to develop has served their nation in good stead in its time of stress.

Nevertheless, we question whether the most far-seeing motor cyclist ever realised that every time he bought a motor bicycle he was contributing money towards the building up of an industry which would be so useful to his country in its time of stress. Everyone realises now the value of the motor cycle and the motor cyclist to the country; but it is not everyone who also realises that the industry which has been founded by the enthusiasm of motor cyclists in the bulk is also a great national asset to-day.

Obviously the most valuable contribution of the motor cycle factories to our own Government and to those of our Allies is in the motor cycles themselves which are being built for military use, as these machines are being steadily manufactured to meet the requirements of the British and allied armies. The point we wish to make is that the matter does not end here, because the manufacture of the motor cycle necessitates the use of material of the very highest quality and the employment of a very high standard of accuracy: it is not merely mechanical engineering, but one of the most advanced branches of mechanical engineering, employing a highly trained and specialised body of mechanics.

We, therefore, have in the motor cycle factories and their staffs, organisations which are eminently suited for the production of warlike material other than motor cycles. In a time like the present all the ordinary engineering firms on the War Office and Admiralty lists are full to overflowing with orders for war material, and the motor industry, including the motor cycle branch of it, is proving itself to be an invaluable aid to these firms. In normal times arms and ammunition factories frequently pass through very slack periods indeed, but now they and almost every firm manufacturing warlike material have more work than they can possibly cope with, and the ability of the motor industry to undertake some of it for them is a great help to maintaining the outputs desired by the Government.

Here, again, the good influence of the motor cyclist is very prominent. He has agitated constantly for better and better machines, and when they have been produced has bought them freely, and in consequence of his enthusiastic support the motor cycle industry has been encouraged to make constant efforts towards perfection, and its standard both in workmanship and material has become higher and higher each year in the attempt to meet the ever-growing demand for better motor cycles. It is because of this that we have to-day a large number of firms who have striven to meet the motor cyclist's demands for perfection, and in so doing have constituted themselves into a body of engineers who are able to meet the highest requirements of the arms and ammunition firms, as they are used to working in high class materials and to very fine limits.

Again, in their constant demand for improvements motor cyclists have benefited the industry in other ways than those just mentioned. Without the constant stimulus applied by this demand for a nearer and nearer approach to

practical perfection the motor cycle industry would have fallen into a state of semi-lethargy so far as improvements were concerned. Year after year would have elapsed with little or no change in design or detail. The industry would have had no incentive to any higher aim than the manufacture of the largest possible number of machines at the lowest possible price: its motto, instead of being "How good?" would have been "How cheap?" and instead of building up to a standard it would have built down to a price. Instead of an industry representing the highest class of light engineering, we should have had a business distinguished for low-class price cutting and employing a standard of workmanship which would have been of little or no help to the country in war time, and of little or no profit to the majority of those engaged in the industry. In advocating improvements ourselves, and in voicing our readers' desires and suggestions, we have not only done our best for motor cyclists, but they and we together have, as we have shown, done what was best for the industry and best for our country.

We might go into the subject at much greater length, but it will suffice to justify our contention if we mention a few typical instances of what is going on throughout the motor cycle industry to-day. For instance, one well-known motor cycle firm is making casing for shells, another is producing in thousands an aggressive implement for use by airmen, another, metal articles which form part of every soldier's commissariat, whilst a leading firm with a large machine shop equipped with the latest labour-saving tools is busy on turning and machining work for several branches of the army and navy. The leather accessory works are practically all at full pressure on work for the army.

All this is very gratifying to us. It is comforting to feel that in the health and enjoyment we have had from the motor cycle, and in the constant agitation for improvements, each and all of us have been assisting in the building up of an industry which is to-day of the greatest service to our country.

HOW EXCELSIOR MOTOR CYCLES ARE TESTED FOR HILL-CLIMBING.

My Two-stroke Week by Week.

I am still merrily burbling around on my baby two-stroke, and, as the roads are "up" in the interests of those prehistoric nightmares commonly known as electric trams, I find it very handy; one can carry it across trenches, or ride it on the sidewalk at need. Without doubt its main delight is that it starts so easily. I pay a business call of twenty minutes. During this interval my 3½ h.p. would have glued up quite nicely in present temperatures; and I should either have to squirt in petrol, or to poise it on the stand, or to push hard enough to moisten my lilywhite skin. But I merely straddle the two-stroke, flood the carburetter, and kick once with each foot. Its most surprising quality is the wear of its ¾in. belt, considering the microscopic engine pulley. The single geared direct drive has a ratio of 6 to 1, but the belt is still perfectly taut after 500 miles; evidently the even pull is very light on belts.

A Home-made Lamp Igniter.

The other week I was emphasising the merit of American lamp igniters in connection with dissolved acetylene, and the next day I met a Scott machine equipped with a home-made device two years old, though the owner used it to light the gas obtained from an ordinary drip generator. On the front down tube of the machine was mounted an enormous switch-block, to which the cable from one of the magneto high-tension terminals was led. Round the lamp burner was fixed a large vulcanite insulator, fitted with two bare wires, the tips of which just failed to touch above the acetylene burner. When the switch button was depressed in riding the ignition current was diverted from the usual short wire to the sparking plug, and was despatched along the lengthier cable, which incorporates the jump spark gap at the burner. The owner reports that the device never fails to light his lamp within a few seconds of turning on the generator drip, and that he has encountered no trouble during two and a half years. Accessory dealers will doubtless experience a brisk demand for such igniter sets quite irrespective of dissolved acetylene. It is further possible that the temporary use of the spark gap circuit might cleanse a sooted plug without the need of a stoppage. The old brigade will remember that such spark gaps were formerly used by Panhard testers, and that they enjoyed a brief popularity on every kind of petrol engine seven or eight years ago.

About Sparking Plugs.

I am reminded that the Forward Co. manufacture a sparking plug which can be taken to pieces for cleaning. Two Manx riders confirm my statement that the Reliance plugs do not soot up, but they add the curious information that they have tried them on Rudge-Multis and Levis two-strokes, and find they become incandescent on long hills, though they behave admirably on the water-cooled Scott. Yet another letter puts an interesting query. It is an admitted fact that the best types of sparking plug gave much trouble early in the year on high-speed four-cylinder light car engines (a trouble which is now in process of conquest); yet these very same plugs are accustomed to behave quite creditably on air-cooled motor cycle engines running up to the same rates of revolution. Why, for example, should a sparking plug last a season on a 2¾ h.p. Douglas, but break down hopelessly through insulation faults in 800 miles on a Morris-Oxford light car? To answer this, one would have to know the relative r.p.m. and explosion pressures. I have run a Morris-Oxford engine up to 33 m.p.h. on second gear, *i.e.*, about 3,200 r.p.m. without allowance for wheel slip; I have also run a 2¾ h.p. Douglas up to 45 m.p.h. on a 5½ gear, which implies a good 3,200 r.p.m. Only a "technician" can answer this query with certainty; I wonder whether the solution is that some light car owners *frequently* race their engines on low gears, whereas few motor cyclists run their engines at over 3,000 r.p.m. except on the rarest occasions? A motor cycle is normally run well throttled down; many light car owners are over liberal with the throttle on the indirect gears.

Weatherproofing.

The war will probably lessen the ardour of invention; big programmes are less possible when the volume of trade is problematical; and I fear the pronounced movement towards a better weatherproofing of our machines may be temporarily arrested. Last week I made a little trip West. I left Town after a long storm had cleared, with my new machine beautifully burnished in every detail, and myself clad in Burberrys. I reached the old-world town of Burford as clean as a new pin, both in person and machine. Just west of Burford I crossed the Oxford-Cheltenham road, and struck the always abominable patch of going which introduces one to the cross road over towards Cirencester. Within four miles the machine and myself looked as though we had lain all night in a claypool. The soft brown road was still saturated, and we brought away about half a hundredweight of it. It took me three hours to get my mount and my clothing really clean that night, because I could not apply a hose. After I had finished I smeared the entire machine with vaseline, and it will not get another clean till I sell it, when the accumulated filth of months will wipe off with the underlying film of waterproof grease. Yet, wherever I go on it, purists will reproach me for bringing the sport into disrepute. As long as there is breath in my body and petrol in my tank, I shall continue to clamour for the weatherproof hosable machine. Above all, we want the abolition of wire wheels, and the adoption of smooth, streamline crank and gear cases.

MILITARY MOTOR CYCLISTS IN ACTION.

A Thrilling and Unvarnished Description of a Modern Fight.

THE ——— Cavalry Brigade trotted out of the Chateau of B———, with the four motor cyclists attached to them, all very cross and irritable, on a nasty wet morning, and still nastier wet roads. I was one of them, and it was our painful duty to keep just behind or just ahead, and little we liked it.

The road lay along the Valley of the Aisne, not quite so much talked about then as it is now, but even then strewn with the awful wreckage of the struggle which lasted so long. Dead horses in any number, dead men not a few, and smashed vehicles of all sorts were seen on every side. About a mile out we passed ——— Battery R.H.A.; the little thirteen-pounders had been no match for the heavy and extraordinarily accurate German fire. Two guns had been upended, and one limber smashed up by direct hits (not bad shooting at a 3½ mile range). The road had practically been destroyed, and the whole place simply ploughed up with the terrible fire; yet our loss had been wonderfully small—two killed and eight wounded.

We went through the pretty little village of Ch———, past Madame C———'s villa with its large, white park gates, through about a mile of thick wood, after which the road was open and entirely without cover for the last half mile into V———.

A Pontoon Bridge.

The road approaches V——— from the south over two bridges, the first over the Aisne Canal, and the second over the Aisne itself. The first bridge was intact, but the second had been destroyed during the French retreat, and had been very slightly repaired by the Germans during their retreat, just sufficient to admit of infantry crossing in single file. During the previous day the Royal Engineers had built a pontoon bridge by taking advantage of the shelter afforded by the still standing ruins. The approaches to the pontoon bridge had no pretensions to being roads; wet weather and cavalry had turned them into veritable quagmires, hardly improved by the straw and faggots, which had been added to give some sort of foothold for the horses. All the motor cyclists got across, Corporal Fred Langton, of Leeds, doing the fastest time, and we all tootled over the greasy *pavé* of the streets of V——— and up the slopes of the hills beyond. Here the Headquarters Staff halted, the greatest part of the brigade being still in the town, and then things started happening. The German shell fire, which had been so intermittent as to be hardly noticeable, increased suddenly in volume, and the position of the brigade, crowded into the narrow streets, was one of extreme gravity.

Carrying Despatches.

One motor cyclist was sent back. It was my turn next; I was sitting in a cottage drinking coffee while Langton squatted outside tightening his belt in a drizzling rain. I was sent off next to give the last motor cyclist another message. I overtook him at the approach and helped him over the bridge and up the other side. I had almost got back to headquarters when a shell exploded in a house on my left, blowing up a feather bed and covering us with down, but hurting no one. Immediately afterwards another ripped up a tree in the square just behind me, and the streets were filled with kicking, squealing horses, and shouting men—a veritable inferno. The shells came fast and I lost no time in clearing. Shortly after I had made my report the brigade started retiring through the town—not a pleasant job by any means, but nothing to what was to come. We halted on the wide tree-bordered road, which incidentally was being enfiladed with German fire, while the cavalry went on in single file, and, fortunately, without loss, reached the other side. The violence of the fire increased; both the approaches of the pontoon bridge were flashing with exploding shrapnel, and soon they started going off overhead. I retreated into a solid-looking house, and the poor old lady inside thought we were Germans come to murder her. We didn't stay long, but followed the brigade back to the questionable shelter of the town. Here Langton and I took refuge behind the houses in a side street; he agreed we might just as well be killed by the same shell. The house at the corner of the street was smashed in, and we were continually being hit by small fragments. Our artillery had meanwhile been busily shelling our infantry upon the hillside, so, of course, a motor cyclist was wanted at once. We both ran out (for myself, I must own to a sort of sinking sensation) and volunteered. I told the officer we could hardly be expected to cross the bridge, and suggested that we should be accompanied by a mounted man. This was done, and we all set off together and went ploughing down the morass towards the pontoons. Langton passed me here and made a perfectly wonderful ascent of the other bank; I was less fortunate, got my front wheel into a deep hole halfway up, and try as I would I couldn't get a move on my heavy Rudge, and then down came the shrapnel. I had a bullet through the saddle and thought it about time to shift quarters. I have seldom run as fast as I did up that bank.

Welcome Shelter.

Just on the other side I saw a few men crouching on the side of the steep canal cutting and sheltered by the abutments of the bridge. I shouted to them, and they said there was room for another, so I lost no time in scrambling down amongst them. They were the fragments of the ——— Field Company of R.E.'s—nine men and four officers. I promptly asked the Major for three men to help me get the bicycle on to the road, and was much relieved when he replied it would be rank murder under such a fire. So there I sat, or lay, rather, watching the shells burst over a farmhouse about 150 yards off. The shrapnel did little but strip the slates, but after a while they started smashing it up with high explosive common shell, judging rightly that our people were sheltering in it, but the old place stood much battering—quite thirty large shells, and then it was by no means destroyed. We were not allowed much of this comparative quiet, for the town becoming utterly untenable owing to the incisive fire with which the

A drawing prepared from sketches and details supplied by the writer of the accompanying article.

Germans enfiladed the streets, the cavalry were absolutely compelled to retreat. This they did in half sections, each body of men was preceded by a couple of shells, which burst right above our heads at a distance of perhaps six or seven feet, and when the bridge was full from end to end of yelling men and snorting horses half a dozen more would be burst right among them with marvellous accuracy. I cannot say I was afraid, the whole thing was too strange and fantastic for that, too much like some weird dream. After a short time I sat up and watched the shells smashing the parapet above us and the shrapnel bullets churning up the water of the canal below. Horses were hit in any number, but riders escaped as if by a miracle. A baronche came up the slope, then more cavalry, and then a limbered waggon stuck on a corner of the bridge. A shell under that waggon would have blocked the bridge for the rest of the brigade. "Get on, you —— fool," we all yelled. "Get out of the way, you fat-head!" while the Tommy lashed at his struggling horses. Fortunately, he got clear, and went thundering over the bridge. Several times we thought the bridge would be destroyed under the continued fire, but, to our relief, it stood the strain.

A Sprint for Life.

After the cavalry had all got over the shell fire became normal, and we judged our best chance to cross, so, one by one, doubled up almost on our hands and knees, we sprinted over the bridge into the precarious shelter of the farmhouse, and then, after a short breather, we bolted over the quarter-mile of open field between us and the wood. We all reached the wood in safety and trudged out of range. We spent the rest of the afternoon in watching our artillery shelling the opposite ridges and hungrily waiting for the night. As soon as darkness fell we set off for the high road, and walked to the bridge. The sight quite baffles description. The road was cut with shell fire and strewn with dead horses—many ripped to pieces—accoutrements, and arms of all kinds, and here and there a corpse. I was glad to find my Rudge still intact and with enough petrol to take me to headquarters. It took four of us to get it up to the high road, the approach being simply torn to pieces; all the faggots were upended, while the whole place was covered with the craters caused by exploding shells. I lost no time in getting back to the Chateau of B——, and went off to bed with a very stiff dose of rum in my inside to sleep the sleep of a very badly scared motor cyclist.

I am glad to say all the four of us reported ourselves with machines intact next morning.

There was one act of supreme heroism performed on that day. A captain of the —— Field Company R.E. stood at the head of the pontoon bridge, and as each cavalryman passed said quietly, "Now, walk your horse; don't gallop." He stood there till blown to pieces by the shrapnel.—CORPORAL R.E.

MILITARY NOTES.

We are asked by Mr. H. P. Beasley, Inspecting Officer for the London Motor Cyclist Reserve Committee (c/o the Auto Cycle Union), 83, Pall Mall, London, S.W., to state that men are still required to serve as motor cyclists in the Royal Engineers. Those residing in London who are desirous of enlisting should make application in person, and those in the provinces should write, giving full particulars of their qualifications.

The "waiting list" of motor cyclists willing to serve, which was compiled by the Auto Cycle Union at the outbreak of war, has now been almost exhausted. Any motor cyclists who have registered their names with the A.C.U. or, for that matter with any other body, and who have not heard anything further on the matter should communicate with Mr. Beasley forthwith.

WEST COUNTRY MOTOR CYCLIST DESPATCH RIDERS.

On the left is Corporal J. H. Winter, of the North Somerset Yeomanry, on a 3 h.p. Royal Enfield, and on the right Corporal N. L. Winston, Royal Wilts Yeomanry, on a 6 h.p. A.J.S.

BLACKBURNE DIRECTORS AT THE FRONT.

An interesting letter has been received by a member of our staff from Mr. Cecil S. Burney, of Blackburne and Burney, Ltd., who, with his brother and C. Q. Roberts (their co-director), are acting as despatch riders at the front. We reproduce the letter below, and it will be immediately realised how practical are the suggestions contained in the remarks:

"Just a hurried line to let you know that my brother and myself are quite well, and have been all through. Will you please send me a copy of *The Motor Cycle* each week? We occasionally get one, and there is always a tremendous rush for it amongst the motor cyclists. There are fourteen of us here, and we are very glad to have had the chance of coming out. We have lost one man only, and another was slightly wounded in the leg by a rifle bullet. Some of the published accounts from despatch riders are really humorous, and lead people to think that we are continually under shot and shell, but it is not as dangerous as you might think. My Blackburne is the only original still running in our section of motor cyclists, and is the one I have ridden all through 1914 in competitions, and I hope to get it through, barring accidents. I hear competitions are not being run in England now. The A.C.U. and Scottish trials are not in it compared with despatch riding. This is a wonderful test for hub gears; the amount of clutch and low gear work done is extraordinary. My Armstrong is standing up wonderfully well. The roads here are practically unrideable when wet and when troops have been over them, while at nights one absolutely cannot ride at all, sometimes. Side wings to mudguards are quite impossible, as the mud is continually clogging and brings the machine to an absolute standstill. More clearance would be advisable even without side flaps. Foot clutches are hopeless, especially when riding past troops. Every machine used here should have a handle-bar control clutch. I have one on mine, and it is most valuable."

"THE MOTOR CYCLE" AT THE FRONT

In our issue of October 15th we published a letter from Sergt. M. H. Thompson asking for a copy of *The Motor Cycle*, which we were only too pleased to send. Below is given his reply:

"Dear Sir,—Permit me, somewhat tardily, but not the less sincerely, to thank you for so sportingly acceding to my request of three weeks ago, and forwarding six copies of your indispensable publication, together with your courteous letter—without invoice.

"I need hardly tell you that your kindness is fully appreciated by us all, and, in our opinion, you have subscribed in the most practical manner to the comfort of at least one section of the Expeditionary Force.

"Again thanking you, and wishing the 'Blue 'Un' the success its matter deserves and its management ensures,

"MILES H. THOMPSON, Sergt. R.E."

In Cevennes and the French Alps.

A New District for a Holiday Tour—covered before the War.

IN using the adjective "new" I do so advisedly, as, at any rate so far as a sidecar is concerned, ours was the first seen in many of the districts we traversed. In nearly every town and village we were the object of an interested curiosity, the crowds which gathered round us at times being quite embarrassing, particularly as our French was not equal to the stream of questions which were poured out upon us. We had generally to satisfy the queries as to the capabilities of the engine to take us over the mountain roads surrounding us by reiterating that the motor *il montait très bien*.

(1) View of Pierre-Plate.

(2) Panoramic view of the Col du Lautaret, the Col, and the Grand Galibier.

(3) The Grande Chartreuse (Isere), showing the tunnels.

(4) The bold face of the Chartreuse, showing the road up St Pierre d'Entremont.

The country in question is the mountain district of the Cevennes and the French Alps lying to the south-east of France. In the past this gorgeous scenery has been confined to the users of motor cars, and before their invention must have been practically unknown to the tourist, as it lies for the most part beyond the reach of horse traction; in fact, we were often days without seeing a horse, and a bullock waggon would not commend itself, either for comfort or speed, but a 4 h.p. engine and sidecar has brought it within the scope of those with very moderate means.

Confidence Justified.

I was fired with a desire to make this trip through the description of the scenery by a friend who made it last year in a car, and perhaps his kindly meant suggestion that I could avoid the stiffest roads made me the more determined to try my luck with a sidecar, with confidence that it would climb anything his 20 h.p. car had climbed, and my faith was justified in the event, for my plucky little engine never once failed to take the stiffest gradient or asked me to shed my passenger. We crossed by Southampton to Havre, and were made to unshackle the sidecar on the boat or pay an extra 10s.; we still wonder why. Crossing the Seine by the ferry at Quillebœuf we took the road south through Evreux, Chartres, Chateaudun, Blois, Bourges, Moulins, Thiers, to Le Puy; the first 300 miles of this is along dead straight and mostly level roads, on a surface which Brooklands would scarcely beat. There being no speed limit enforced we did not waste time, and only stopped for cursory visits to the cathedrals and chateaux which we happened to pass; of these we found quite sufficient, without turning off to the chateaux district proper, as our objective was mountain scenery rather than architecture and places of historic interest.

An Impossible Road.

We had an amusing *contretemps* at Blois, which stands on two hills, the chateau surmounting one, and the cathedral the other. We asked a passer-by for *la route à la cathédral*. He directed us up a narrow street, but looking at our turn-out, remarked it was *très monté*. However, we started up and found ourselves faced with a *pavé* of 1 in 5 gradient. Onlookers seemed

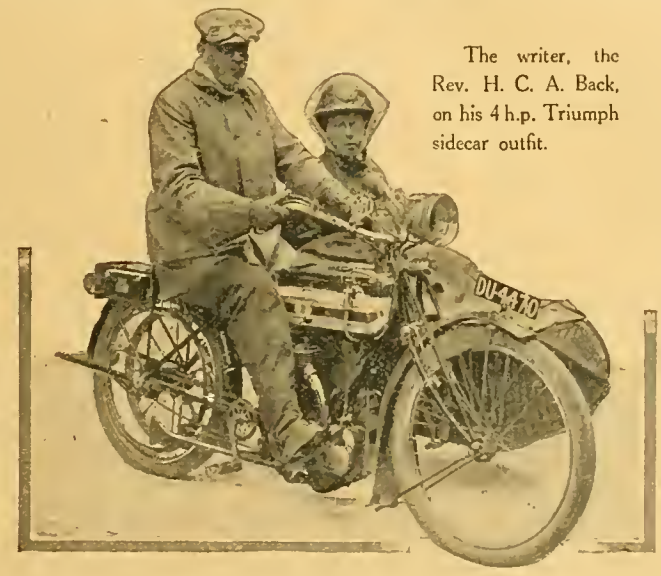
In Cevennes and the French Alps.—

surprised as we roared up on bottom speed, and we presently realised why, for on turning a bend we were faced with a flight of some sixty steps, and had to own our one and only defeat.

Gorgeous Scenes.

After passing through Vichy and Thiers we began to get into the scenery we were seeking, and every day seemed to give us something finer than the last. We went through gorge and pass in succession, making Le Puy a stopping place for a few days, from which there are a number of excursions varying from twenty-five to eighty miles. One very fine run is *viâ* Sauges and up La Petite Suisse by the Monestral d'Allier; this is a steady climb of 3,080 feet, with wonderful views all the way, but so well is the road engineered that it is seldom necessary to drop below the second speed. Travelling south-west through the gorges, one gets some of the finest scenery of all, but one must not have nerves in negotiating the hairpin bends, with a sheer drop of 500 feet if one leaves the road. On the whole, the motor bicycle and sidecar is much more handy on these roads than some of the cars we met, as they were unable to take the turns without pulling up, and coming down we were always able to show them a clean pair of heels with safety.

From the Cevennes we struck eastward, making for the Alps, *viâ* S. Julien and S. Agréves. The road as usual began with an ascent for twelve miles, and here we had our only real trouble: the second speed, which was our mainstay on these long hills, gave out, through using too thick an oil, but by putting the top gear up to 3.75 to 1 the bottom speed was not so painfully slow.



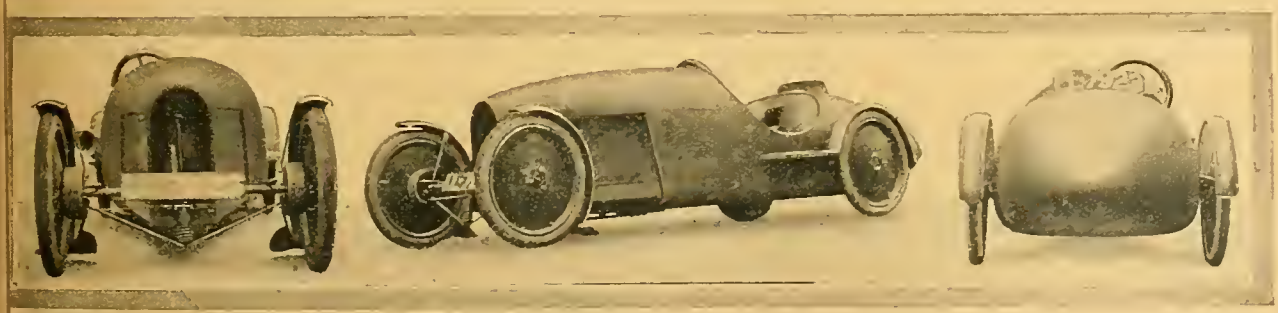
The writer, the Rev. H. C. A. Back, on his 4 h.p. Triumph sidecar outfit.

Crossing the valley of the Rhône, we took the route up the valley of the Tesoire as far as Voison, where we turned up the Grande Chartreuse. The ascent was distinctly trying, the surface being badly cut up with timber carting on a heavy gradient, the road in several places being tunnelled through the rock. We finished up with a stiff pull of 1 in 5, after which the engine was glad of a cool while we visited the now deserted monastery of the monks of Chartreuse. Following a northern road, we ran through Aix-les-Bains and round by Lac d'Annecy, coming down the valley under Mt. Blanc. Grenoble made a good stopping place, and a new gear was awaiting us. For this we were duly grateful, before tackling the Col du Lauteret in the Hautes Alps; unfortunately we were too early to cross over the pass, as the snow had not yet allowed the pass to be opened.

We had now to turn northwards again, and kept mostly on the *route nationale*, corresponding to our county council roads, to Versailles, from which place we paid a flying visit to Paris. On the whole we found the second grade, or district council roads, the best throughout our trip. The French have not yet mastered the problem of heavy traffic, and at times we struck stretches of road for some miles that were worse than wicked. But it would be unfair to leave the impression that the French roads are bad; on the whole they are very superior to the English main roads, but their best and worst are respectively more superlative than ours. For a summer holiday I can strongly recommend a similar tour, good roads, magnificent scenery, and very moderate expense, distinctly cheaper than England or Scotland.

H.C.A.B.

A LIGHT SPORTING TYPE CYCLE CAR.



The Percival White cycle car, driven by an M.A.G. twin-cylinder engine, 82 mm. bore by 102.5 mm. stroke (1,083 c.c.). The transmission is by two chains from engine to countershaft and a wide flat belt to the rear axle. Belt tension is maintained by a jockey pulley The front axle is pivoted centrally, and Lynton wheels are fitted The price is £95.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Lubrication.

My lubricator is a suction drip actuated by a milled disc placed below the tank. It is thus impossible to see at what rate the oil is being supplied to the engine, and as I am something of a novice I do not care to trust to my estimate of how the engine is running as a guide. Will you please advise me what to do?—O.W.R.

It is difficult for us to tell you exactly what to do, as you seem to be working absolutely in the dark with such a system of lubrication. All we can suggest is that you set the disc so that it gives a fairly generous amount of oil—say, turn it halfway on—and then, after a day's run, see how much oil there is left in the crank case. If there is a reasonable amount you will know that the lubrication has been approximately correct. Do not allow the engine to have enough oil to make it smoke. You will thus find out by experience at what number to set the disc.

Valve and Magneto Timing.

(1.) I have had a 3½ h.p. engine down for repairs, and have overlooked the valve timing, and should like to know what positions should the piston be in when the valves are opening and closing. (2.) I have been examining the magneto, and find that I get the hottest spark with the contact breaker in the advanced position. I am under the impression that the contact points should break when the armature is in a position to give maximum spark when fully retarded. Is this correct? (3.) When should the spark explode the mixture with magneto fully retarded, I mean with regard to position of piston? —ALPHA.

(1.) Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for one complete stroke of the piston or while the flywheels turn through 180°. (2.) Magnetos usually give their hottest spark when almost fully advanced. (3.) Time your magneto as follows: Place the piston exactly on top of the compression stroke and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. This will mean that the explosion when fully retarded will take place when the piston has travelled about 3 mm. down the firing stroke.

Replacing a Cylinder.

Can you give me any special hint or tip about taking down and replacing cylinders after cleaning? The magneto and chain cover seem to be in the way of one of the nuts on the cylinder, the magneto being just behind the engine. Is there a means of getting at this nut without removing the magneto, which, of course, will upset the timing? I am rather nervous, too, about bolting the cylinders on again, as I have had one burst. I have been told to bolt it on across and across. The thing I really want to know is how to tell if the cylinder is on right and square, as the other one did not burst at once but after about a thirty-mile run.—H.R.C.

You should get a local mechanic to construct you a special tubular box spanner for the nut in question. A spanner could be made for a few pence, and we think this would get over your difficulty. As regards tightening down your cylinder, the opposite corner bolts should be tightened down as you suggest, but before locking up any nuts hard, all four should be tightened down as evenly as possible, *i.e.*, tighten until each one begins to get stiff, then go round, giving each opposite corner nut half a turn at a time. Beyond this there are no further precautions necessary, except that the face of both cylinder and crank case should be absolutely clean.

Passenger Carrying on a Lightweight.

I am thinking of buying a lightweight motor cycle. The particular one I fancy is the Popular Model Levis, 2¼ h.p. My weight is 9 st. 7 lb. Could I carry a passenger on back (her weight is 7½ st.)? What speed could I expect, and what mileage per gallon? If needed, could a very light sidecar be fixed on at any time?—B.C.

The machine, though excellent as a solo mount, is not really powerful enough to propel two people. The average speed would be about 25 miles an hour, and the consumption of petrol about 80 miles to the gallon. Fitting a sidecar is not to be recommended in the case of such a small machine, though it is practicable, and, in fact, some owners of sidecar outfits of this power derive great satisfaction from their running. (See letter on page 490, issue October 15th.)

RURAL MAIL DELIVERY IN U.S.A.

Whereas in America rural postmen ride motor bicycles, in England they are mounted on sidecar outfits.

Oildag.

I have recently used one gallon of oil mixed with one charge of Acheson's graphite Oildag, and thereby reduced the consumption of oil. I have, however, heard so many alarming suggestions from fellow motor cyclists as to the possible effect of graphite, in any form, on big end and other bearings, though I cannot find that they have had any experience in the matter, that I have been afraid to continue this practice. My object has not been so much to save oil as to increase the intervals between cleaning the cylinders of carbon deposit and thus save some labour in the course of a year.—H.W.K.

he preparation you are mixing with ur oil is absolutely harmless, and will t damage the bearings. We have tried e preparation ourselves and found it ite successful. We used it for some onths and never found any other than neficial results.

Knocking.

I have a 1910 2½ h.p. twin N.S.U. motor cycle, which I have just had all down and overhauled myself, and had new crank pin and bush fitted by makers. The magneto is timed exactly as the makers advise, *i.e.*, piston of cylinder No. 1 (which is the back one) is exactly on top dead centre of compression stroke when platinum points of magneto are just breaking on segment No. 1 (Bosch magneto) and the spark is fully retarded. The points, when broken, are apart about the thickness of a piece of paper. The trouble is that when I advance the spark when running on the level the engine knocks badly, and reducing the air does not seem to improve matters. I also find I can climb better with the spark retarded, as when I advance it the running seems to be upset. I am also troubled with No. 2 cylinder I presume), which stops firing when running at a low speed, but which picks up again as soon as I advance the spark; then the knocking commences. The bush on the pulley side of crank case is about $\frac{1}{32}$in. slack. The machine has an undergeared pulley and overhead mechanical valves. I may also mention that the last crank pin broke, and this I put down to the bad knocking, and also to the timing being too far advanced, but I find now I am no better than before, and know that the timing is correct, both by makers of engine and magneto. There is really no soot to speak of in the cylinder heads. The gear of the machine is high.—J.P.

e bush on the pulley side of the crank se, if a full $\frac{1}{32}$in. slack, is quite suffint to cause a bad rattle or knock, d you should make certain that your wheels are absolutely true, as in ting the new crank pin it is possible t they have got slightly out of line. is possible, too, that the engine will t stand quite the advance that you ve given it, in spite of the makers' rections. Before altering this, how-er, it would be worth while to prove t the carburetter is in perfect order, d all the petrol passages are clean, the trouble might be due to too weak a mixture. Re-make your inlet pipe joints and lag them with asbestos string and insulating tape; any misfiring at slow speeds is almost certain to be due to a leak between the carburetter and the engine, or possibly to an inlet valve which is very loose in the guide, in which case a new valve is required.

Light Two-stroke and Sidecar.

(1.) I was much interested in an article in your last issue giving the experiences of a Levis rider with a sidecar, and as my machine (Clyno two-stroke two-speed) is as good as the one mentioned, I am anxious to have a light sidecar attached — the frame appears very strong. Do you think, on fair roads, the engine would be able to do the work; if so, would you give me the name of a firm who make light strong sidecars? (2.) I have ridden my Clyno about 1,800 miles this season up to the present, and when the weather breaks I intend putting up for the winter. Is it absolutely essential that the engine should be taken down to clean? (3.) I am troubled with a slight leakage of oil on the pulley wheel side; it gets on one side of the belt, making it very greasy. Could I adopt anything to prevent this? The crank case compression is very good, so this leakage does not affect it. (4.) I find 35 m.p.h. the maximum speed with threequarter throttle. Could I do anything to get more speed with full throttle, as at present with full it goes off top speed? —I.X.

(1.) The two-speed two-stroke Clyno would probably be capable of dealing with a light sidecar, if you are prepared to use the low gear to a fairly large degree. We do not, however, recommend the use of a sidecar, however light, on such a small machine. If you desire to fit one, almost any of the best known sidecar manufacturers make a very light model for this sort of work, and consequently you have a wide choice. (2.) When laying your machine up for the winter you should certainly remove the cylinder and piston and scrape off carbon deposit. You will probably find quite a heavy deposit on the exhaust port, and on the underside of the piston. It is a particularly simple job to clean out this engine, and it can be done with care by the veriest novice. (3.) The oil leaking from the pulley-shaft points either to a slightly worn bush or the use of too thin a lubricating oil in the gear box: we should be inclined to suspect the latter. A first-class light gear oil will be found most satisfactory. Leakage in this hearing will not affect the crank case compression, as the gear box, although cast integral with the crank case, is entirely separated from it by walls. (4.) Thirty-five miles per hour is about the maximum speed of this machine, though you might get a slight increase in speed by thoroughly cleaning out your engine and using a slightly higher gear. With the carburetter supplied you will find that threequarter throttle is about the most efficient position with an ordinary touring jet, and you will obtain little or no gain by opening up further.

Time Limit for Summonses.

I should be much obliged if you would answer the following queries. I received a summons for recklessly driving a motor cycle which was issued more than six weeks after the alleged offence. Is this legal? It also says for driving a motor car. Is a motor cycle a motor car in the eyes of the law?—W.A.S.

It is quite legal to issue a summons for driving to the common danger or reckless driving six weeks after the offence; it is only speed limit summonses which must be delivered within twenty-one days. In the eyes of the law a motor cycle is a motor car.

Belt Breaking at Fastener.

I should be glad if you could give me a suggestion in a difficulty. I use a 1in. belt on a standard roadster Triumph with a Stanley fastener. Every time the fastener goes round the pulley there is a metallic click, and the belt gradually breaks off behind the fastener. I had the same trouble with an Amac belt fastener. It is as though the belt and fastener had to turn round too small a circle. But in three previous years with the same belt, fastener, and machine, I never had this trouble. Am I looking in the wrong place for the fault?—W.J.C.

Probably you have the adjustable pulley opened out rather too far, and the belt "bottoms" every time the fastener comes round, thereby putting an extra strain upon the belt. Try raising the gear slightly. It is also possible that the belt is faulty or the fastener not mounted centrally.

Comforts for Despatch Riders.

Sir,—May I, through the medium of your columns, say that I am collecting comforts of all kinds for the Motor Cyclist Despatch Riders of the Second Army Corps? Socks, mittens, mufflers, tobacco, cigarettes, pipes—all such things as will be of use and comfort to these brave young men.

Should some of your readers be good enough to send any of the above-mentioned articles to 14, Scarsdale Villas, Kensington, W., I will gratefully acknowledge them, and see that they go through with the name of the donor.

(MRS.) L. A. SELWYN.

Standardisation of Controls.

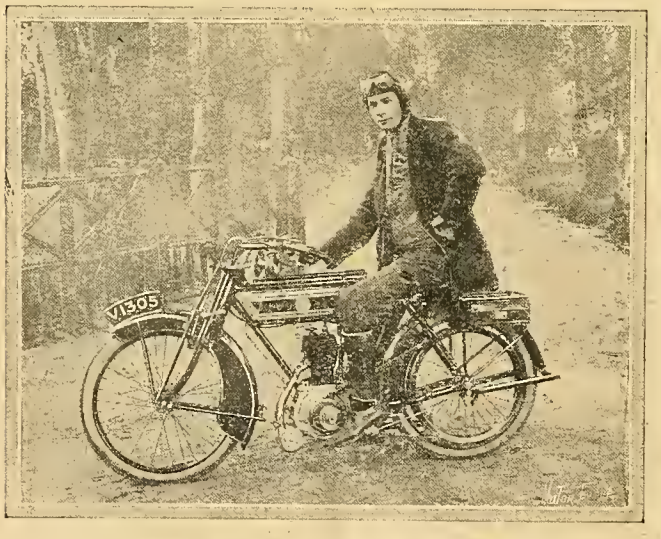
Sir,—So much has been said lately about the standardisation of carburetter controls that few seem to have given any thought for the other controls. I think that it would be a very good move if a definite form of clutch and magneto control could be decided upon. About the latter there is still a diversity of opinion as to whether tank or handle-bar control should be settled on. But for the clutch the handle-bar control is obviously superior to all others, both in the ease with which the clutch can be slipped in traffic and in the fact that the feet are left free. If all makers would fit hand-controlled clutches and standard forms of magneto and carburetter controls on their 1915 machines, the driving of a motor cycle would be easier and safer.

A. STATHAM.

Experiences with a T.T. Mount.

Sir,—I am enclosing you a photograph of my T.T. Premier, which I have had since the beginning of the season. Trouble has been nil. My petrol consumption averages about one hundred and twenty miles per gallon. The machine is fitted with semi-T.T. handle-bars and Philipson pulley, which I think make it an ideal solo mount.

GEORGE A. SEMPLE.



G. A. Semple, who writes of the satisfactory running of his 3½ h.p. T.T. Premier.

Petroil Lubrication.

Sir,—We agree with your remarks on the question of oiling on two-strokes. We may say we have experimented with most of the systems of oiling and find that the best system is that at present fitted to the Wooler, which is by pump through a sight feed lubricator, and which is controlled by the throttle.

We always read with interest any comments you make on current design in your interesting and instructive journal.

THE WOOLER ENGINEERING CO., LTD.
JOHN HULL (Managing Director).

Sir,—In an editorial in your issue of October 29th you predict that the popular "petroil" system of lubrication used on two-stroke engines is going out of favour. Now I venture to believe that the method of mixing the oil with the petrol as the sole system of lubricating two-stroke motor cycle engines has come to stay, and if you can spare me the space I will endeavour to explain my reasons for so thinking.

Whatever system is adopted it is evident that a large proportion of the oil must get into the crank case, otherwise a seized big end bearing would soon result. Those makers who exercise their ingenuity in devising means of keeping the petrol and oil separate, and at the same time adopt crank case induction for the petrol, are up against a hopeless proposition, because the churning of the crank will mix them up in a most thorough manner. Now, if the petrol and oil must be mixed together in the crank case, why not feed them in through the same pipe? Obviously the most convenient way of doing this is to mix them in the tank, both reaching the crank case *viâ* the carburetter and induction pipe.

Consider the advantages of such a system:

If the oil supply fails for any reason the petrol supply fails with it and the engine stops, so no harm results.

Again, as you, yourself, allow, "a throttle controlled lubricator is surely ideal and perfectly automatic," the amount of oil supplied being varied to a nicety with the work done by the engine, which is as it should be, and is found in no other system of lubrication.

Dealing with the objections to this system:

I have seen it stated repeatedly that if the machine is left standing for a time the oil settles at the bottom of the tank and the machine has to be shaken before making a start to mix the oil up again. This is not so, the oil goes into solution and the petrol and oil can no more be separated by standing than a mixture of whisky and water; like the whisky and water, they can only be separated by distillation. This is what happens in the engine. The volatile hydro-carbons (petrol) are vaporised; the fixed oils (lubricant) forming a cloud of oily particles which are thrown about eventually find their way into the bearings.

Another objection is the dirty appearance it gives the machine. My machine is ridden almost daily and it is no dirtier than other people's; indeed, it is much cleaner than most of the machines I see. A wipe down before putting it to bed is all that is necessary—the oily film on the carburetter serving to keep it as bright as a new pin.

Whether the interior of the engine carbonises more quickly than air-cooled two-stroke motors lubricated by other means, I am unable to say, and it would be interesting to hear the experiences of Levis and Peco owners in this respect. I will give you my own.

The machine is a Connaught, and I have had the cylinder off once since purchasing it, not because of any loss of

"SUNSTONE" for machines up to 8 h.p. A good anti-skid and unrivalled for heavy work. 26×2¼ 40/- 26×2½ 45/-

tune, but because, after burning fifteen gallons of petrol I thought it would require cleaning. I had been in the habit of occasionally feeling the piston head through the plug hole, but could find no carbon deposit here; on taking the cylinder off, however, a different state of affairs revealed itself. The two top piston rings were gummed in their grooves. The corners of the exhaust ports were filled with carbon deposit, making them oval instead of rectangular, and there was a heavy deposit on the *inside* of the piston head. The cleaning process was quite straightforward, there being no inaccessible valve pockets, and it not being necessary to remove the piston.

To conclude, the "petroil" method of lubrication is so simple and withal so satisfactory that I feel quite sure that, as I stated at the outset, it has come to stay.

P. W. HAMPTON.

Crystallisation.

Sir,—I read with interest "Ixion's" article on single forks. Might I call attention to a fallacy in it? He regards the fracture of a bar of metal to be due to "crystallisation." All metallurgists nowadays regard this as totally erroneous. Fracture in such a case would be due to "fatigue." All metals are crystalline, the chief difference being the size of the crystals. Any metal suitably polished and etched, when examined under the microscope, shows definite crystals. These crystals have a certain amount of cohesion, and to this cohesive force the strength of the metal is due. After many reversals of tension and compression, a certain amount of amorphous matter is formed round the joints of the crystals, and breaks up the cohesive force. The metal loses its strength, and is more or less easily broken. This is known as "fatigue." This amorphous material when allowed to stand for a long time, or when heated to a low temperature for a shorter time, gradually crystallises, and the material again resumes its normal strength or becomes even stronger than it was before this treatment.

L. PHILLIPS SMITH.

Sir,—The question which "Ixion" raises in *The Motor Cycle* of October 29th is based upon a quite common misapprehension as to the nature of the steed he rides. As it left the factory it was already in a crystalline state. That the common crystalline substances, as sugar and soda, are brittle leads us to think that other substances which are not brittle are therefore not crystalline. Steel is a case in point. It consists of, in the case of mild steel, crystals of ferrite and pearlite. It is now quite definitely established, although not widely known, that steel does not change in structure at anything approaching ordinary temperature, and metal of over 4,000 years old is in the same crystalline condition as if it were made yesterday.

Provided the metal does not contain injurious impurities, fracture always occurs *across the crystals*, whether the fracture has been produced by shock, static stress, or "fatigue." The fracture never occurs by the metal forming crystals by vibration and then breaking at the boundaries, as is suggested by such terms as "crystallisation fracture." In fact, we know that in good metal the boundaries of the crystals are stronger, and it is only when chemical impurities are present in the steel, resulting in the formation of weak chemical compounds which accumulate at the boundaries of the crystals, that the inter-crystalline fracture, as it is termed, occurs.

As we know from readers' complaints, this weakness leads to fracture whenever sufficient shock is applied, whether it be after one mile or ten thousand.

The full explanation of the modern theory of fracture by "fatigue" under vibration is too lengthy to discuss in the course of a short letter.

The remedy for fractured forks is not to imagine that changes in the metal are likely to take place, the final condition being already present in the new metal; but, having determined by test the nature of the metal to be used, the remedy is to design the forks as girders which are going to be subjected to determinable static and dynamic loads. Given a good metal of known tensile strength, a good engineer can design perfect single forks, and these are to be found in the modern lightweights of good makes. If he finds that the design for the particular load to be carried is ugly and heavy-looking, he develops a stronger "form," which is lighter and more artistic—to wit, the girder fork.

One thing more, I have not got the description of the Splitdorf magneto and dynamo by me to refer to, but one would expect that the residual magnetism would be sufficient to set an induced current of increasing magnitude, which, by either series or shunt magnet windings, would give a strengthened field as the kick starter was operated, and that finally the batteries would cut in at a pre-determined voltage. This could, of course, be accelerated by passing current from the battery before starting up, but that the failure of the battery should put the engine *hors de combat* seems, for the above reasons, unlikely.

ARTHUR MARKS, F.I.C., A.R.C.S., A.R.S.M.

Chain Drive and Spring Links.

Sir,—Your correspondent "AS 129" writes complaining of the spring links on his chains breaking. I myself have had the same trouble. First I had the nut and bolt with split pin fastening. I found the thread on the bolt stripped, and the split pin was the only security, and as soon as it sheared through the trouble commenced. When the spring link came out it was a great improvement on the old idea. I have never yet broken a back chain with spring link in, but the front one was continually breaking. What I blame for it is the high speed at which the chain runs, and the small sprocket (compared with the size of the others) it runs over. The following is the way I got over the difficulty. First, scrapped the spring link; second, in place of the spring link I used an outer link, which made the chain endless; and third, removed the gear box forward about two inches to get the endless chain on, and then put it back to its ordinary position. The back chain cannot be treated like this, but in my case there is no need for it, as the chain never breaks, but dies of old age. The disadvantage of this is the front chain is not so easily detached.

615.

Sir,—I have now completed three years' experience with chain drive, and should not like to discard the spring clip. I have used two kinds, and I have never had one of the older pattern come off. The other comes off if not put on the right way, *i.e.*, the opening following the direction of travel of chain. Further, my experience of nuts and bolts on push cycle chains is that they come undone if not burred over each time they are fastened, which would not do for motor cycles, as one often wants the chain off to immerse in grease.

C. H. INGAMELLS.

J. S. Hyde and R. W. Gore, motor cycle despatch riders attached to the General Headquarters of the British Expeditionary Force. The photograph was taken near the Franco-Belgian frontier. Both riders have been at the Front since the commencement of the war, and are seen mounted on Douglas machines.

An Opportunity for Enlistment.

Sir,—I believe there are many men in the employment of motor and cycle manufacturing companies in the district who would be glad to enlist in a non-manual company, composed of men from the staffs of such firms. I should be glad to take the names of any wishing to join, and if the requisite number is forthcoming, I am quite prepared to form it. Recruits are coming in steadily, but I have room for a large number still, and I feel sure there must be many young fellows who should take this opportunity of serving their country. Applications should be made to me at the Drill Hall, Thorp Street, Birmingham.

T. J. GRAHAM, Lieut.-colonel,
6th (Reserve) Battalion Royal Warwickshire Regiment.

A Steam Motor Cycle.

Sir,—I was very much interested in the letter of your correspondent, Mr. J. H. Hatch, and entirely agree with him that a steam cycle would not be nearly such a bulky machine as many may think. Two small force pumps only would be necessary for the purpose of driving water through the coils of the "flash boiler," and for forcing paraffin to the blow lamp within the coils. A small 4-5 h.p. twin-cylinder would be sufficient power, enabling one to dispense with gears and clutch; in fact, one may just sit astride machine, open throttle, and glide away.

The ordinary petrol engine type of lubrication should, I think, be discarded, and several glass lubricators of the type one sees on gas engines substituted. I hope the idea will be taken up by some manufacturer in the near future.

J. WINDHAM HART.

Why an Engine Konks.

Sir,—Your contributor is surely in error in stating that the blow given to the piston is delivered at an angle. One of the very earliest principles that one learns in studying elementary mechanics is that "fluid pressure always acts normally to the surface pressed." If it be assumed that the pressure is distributed, as shown in fig 2, then there would be no pressure at all in the centre of the cylinder head, and on opening a compression tap there no gas would escape even at the moment of explosion, which is absurd.

It is probable that the cause of konking is that given nearly at the end of the article, viz., the reaction due to the angularity of the connecting rod So the tendency to konk would be the same for all types of combustion chamber, but would be more pronounced where the connecting rod is short in proportion to the stroke and with greater cylinder clearance.

I seem to remember that you published a very good article on this subject some years back.

C. E. SQUIRE.

Sir,—I was greatly interested in a short article in *The Motor Cycle* on the subject of engine knocking. Your contributor (as I see you have pointed out editorially) lays down the law in a surprisingly exact manner, and, whilst his article is very interesting, it is extraordinary to have the whole of the knowledge of any subject, together with the vast amount of experimental work that has been done by different persons all over the world, dismissed in two columns of print.

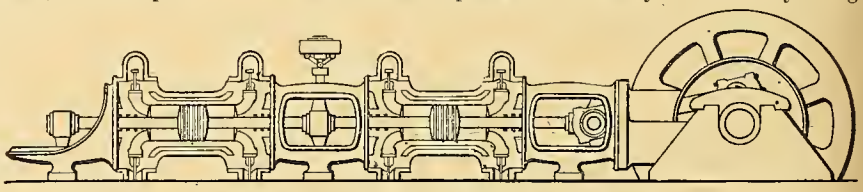
It is not possible to refer to different forms of knocking, and to separate up each different type of noise into pigeon holes. The internal combustion engine represents one of the most beautiful and yet complicated grounds for research known to the engineering world, and, as your contributor must surely have found, in two engines apparently exactly the same, absolutely different sounds will occur which it is quite impossible to classify under any artificial heading.

To take fig. 1 in your diagram, if the engine is made to revolve the other way with a detachable head whose shape can be varied, the same type of knock and the same variation is observable either with an electrical sonoscope or upon an ordinary manograph indicator card. How, therefore, does this fit in with the statements laid down as law? Truly, the explanations given may apply to some cases, but in many hemispherical headed engines one can obtain exactly similar sounds as occurred when the head is replaced on the same engine by the "Γ" headed combustion chamber. Another point which must be remembered is that experiments have shown many forms of knock, including variations of pinking or tapping, to be due to a variety of causes taking place at the same time, and to the slack being taken up over-rapidly and leading to actual mechanical contact. This has been actually proved by experiments by measuring the electrical resistance between bearing and shaft, etc., whilst in motion.

Another point of importance is the question of the piston "being blown from one side of the cylinder to the other by the rush of the explosive gases on the top." I quote from your contributor's remarks. Now during the initial portion of the explosion—that is to say, whilst the pressure is at all near the 300 per square inch referred to—the explosion pressure rises through the mass of the mixture with considerable speed, and the gas as a whole, apart from the valve entry whirling, is not passing over the head of the piston at all. Experiments will show that there is no enormous tendency for the gas to "hit" the piston itself unless it has some exit opposite to the point of ignition. I do not by any means wish to suggest that your contributor is not correct in some cases, but I do suggest that it is quite impossible to speak generally or with such extraordinary brevity and to attribute the konking of motor cycle engines to a cause which, as you, sir, yourself point out, *does not exist* to any appreciable extent in most motor cycle power units.

A. M. LOW, A.C.G.I., D.Sc., etc., etc.

Sir,—We do not suppose many people will agree with Mr. Watchorn's explanation in last week's issue of *The Motor Cycle* of how the noise of konking or pinking is produced in an engine. It has, of course, often been suggested that it is due to the piston moving from one side of the cylinder to the other, owing to the angularity of the connecting rod, but, to us at any rate, the suggestion is new that the firing of the gas on one side of the cylinder should be the cause of the piston moving over. That this is not a correct explanation can easily be tested by firing



Gas engine referred to in Lodge Bros. and Co.'s letter.

simultaneously at two plugs in a T-shaped cylinder, one plug over the inlet valve, the other over the exhaust valve. The pinking can still be produced by setting the ignition early enough.

That the noise of pinking is almost certainly not produced by the movement of the piston against the sides of the cylinder wall is suggested by the fact that the same noise can be produced on an engine which has both a piston rod and a connecting rod, with proper guides to take up the thrust of the connecting rod, as in the gas engine indicated in the sketch. Pinking is such a metallic noise that the cause is generally ascribed to two pieces of metal knocking together, but the noise can be produced without any concussion of metal parts.

If the gas is fired early while the piston is still rising on the compression stroke, the intensity of pressure is so great that the gas detonates instead of expanding at the usual rate. The effect of the sharp blow of the detonation sets up exactly similar vibration in the metal of the engine as if the metal parts had been tapped with a hammer.

The reason why this explanation of the sound is not accepted by many people is probably because the phenomenon of gas detonation is not met with in practice, except in the case of internal combustion engines. An analogy is the well-known water-hammer effect caused by turning off a tap too quickly. Anyone not knowing the true explanation might try and explain the water-hammer knock by saying that some metal parts were probably loose in the tap.

LODGE BROS. AND CO.

A DESPATCH RIDER'S DIARY.

THROUGH the courtesy of his sister, we are enabled to give some interesting extracts from a diary written by Corporal F. K. Langton, R.E., a prominent rider from Leeds. He would have taken part in last year's Tourist Trophy Race had he not had a serious accident after completing his final lap. The diary dates from the very beginning of hostilities, and continues to November 4th.

AUGUST 20TH.

We have had a great time to-day trekking from H———. All the Belgian villagers turned out solid with presents of chocolate, cigars, cigarettes, and bottles of wine. I did a nice steady business, as the motor cyclists led the whole lot when on the march. Three of us are stationed to-night at cross roads to wait for any despatches that may come from headquarters. We have just heard that the Germans have sacked and burned a village six miles away, and are advancing. There is one constant stream of people who have deserted their homes and are carrying all their portable possessions with them. They don't know where they are going, but wander aimlessly about; it is pitiable to see them.

Corporal F. K. Langton.

AUGUST 24TH.

I had my baptism of fire this morning. I was rather surprised that it worried me hardly at all. I was not even excited. I was with the General and his staff—about thirty of us—and the Germans spotted us. We sheltered under cover of a house, and they had six guns firing on us for about half an hour. We could hear the shells quite a few seconds before they arrived, owing to their peculiar whistle. Finally we got the order to clear out, as it was getting too hot. Three of us on motor cycles had to stick to the road and run the gauntlet for about a mile. One of our fellows had the whole of his kit blown off his carrier by a piece of shell, fortunately without hurting either him or his machine. Another shell burst in a field about fifty yards on my left, and the nose of it struck a tree and dropped just in front of me.

AUGUST 25TH.

We had some excitement yesterday. I have got a rifle now, and lost the whole of my kit. Owing to a false alarm, the drivers of some transport waggons got excited, and in the scrimmage my kit was lost.

AUGUST 28TH.

The headquarters were at a farm. Six of our fellows found a party of Germans. They killed four and captured two more, but one got away and brought up reinforcements. We have only cavalry with the General's staff, so the Greys charged before the Germans could get their artillery into action, and went right through them and back again: it was great! The German cavalry turned and bolted, while the infantry threw down their arms and lay down, pretending to be dead. One of our men got four within two hundred yards. There are five motor cyclists attached to the ——— Cavalry.

AUGUST 30TH.

Disaster. I lost my rifle just when I had got a "prong" for it, but still I will get another in the next scrap.

AUGUST 31ST.

They have been fighting all day in the woods, and I have brought two wounded men in on my carrier. Both tell me we are out-numbered six to one, and are getting badly knocked about, but one cannot rely upon what the men say.

SEPTEMBER 3RD.

We are south of Paris now, but a good deal to the east. Hardly a day passes without our having some kind of engagement; almost always artillery. "J." Battery are very fine. They have been in action practically every day, and only lost one man wounded.

SEPTEMBER 8TH.

The long talked of event has at last appeared, and we have turned round and are advancing, and rapidly, too, and carrying everything before us. We had a hot time yesterday morning, but the German shrapnel is no class. One struck the road and burst about two yards from me and never touched me, while another one went between one man's legs and burst within a yard of him. The shock knocked him on the ground, but he jumped straight up and ran for cover.

SEPTEMBER 10TH.

We have done very well to-day. Cavalry sighted the enemy about 2,000 yards, marching in column, got the guns to work on them, and the Greys charged and they surrendered in dozens. We lost another of our motor cyclists yesterday, shot clean through the head. (We have been made up to our full strength again.) I am beginning to think this is a riskier game than I first thought.

SEPTEMBER 14TH.

We have had a ——— of a time to-day. We crossed the river by pontoon bridge. The Germans let us all cross, and then starting shelling us. They had the range to an inch. It was a real death trap. I sheltered under a wall for about two hours, watching them knock the village to pieces by degrees, then was given a message to take back over the bridge. (This is the incident described by Corporal R.E., whose article appears on pages 520 and 521 of this issue.)

SEPTEMBER 19TH.

The Germans have apparently retired to a very strong position. Whatever the papers may say to the contrary, there is no doubt about it the Germans can use their big guns. I was crossing the river and one shell blew my hat clean off. Needless to say, I did not stop to pick it up. I was the only one of our motor cyclists who got my machine back, as all the others had to leave theirs stuck in the mud, and fetch them at night. We have nine motor cyclists now. During the retreat two of us were doing twice as much as the whole lot do now.

OCTOBER ——.

Some of the Indian troops arrived here yesterday. (We needed them.) They were put in the trenches to relieve the Greys. About midnight terrific firing began, and a man came running up to say that the enemy had broken through the lines. I imagine he must have dreamt it, as our men held them back comfortably, but it is funny how this kind of work preys on one's mind. The same man described how he looked up and saw a German only a few yards away, how he shot at him and ran, chased by three others, one of whom clutched his hat, but missed him, but finally arrived at headquarters, absolutely exhausted. He is now under arrest, and may get into trouble for leaving his post.

I am glad to hear —— is coming out. We need more men, provided they are good. When one comes to think of it the British Army is a mere nothing compared with the German numbers. If we had an army the same size as theirs, and as good as our present little one, we should knock spots out of them.

Some More Recent Experiences.

NOVEMBER 3RD.

There has been a severe fight going on for the last three or four days. We are very much outnumbered, and are being slowly driven back. The Germans broke through our lines the night before last, and we had to move in a hurry; we lost rather heavily, but the Germans lost hundreds. Taken man for man, the Germans are not half so good as our men, but there seems to be no end to them; our men in the trenches say that the Germans come in masses, and as fast as they are shot down their places are filled. One of the officers attached to our headquarters borrowed a rifle yesterday, and went out and bagged eleven of them.

NOVEMBER 4TH.

Things look considerably brighter to-day. We have quite a lot of French troops helping us; their Tommies are perhaps great, but their batteries are absolutely IT. This really is a ghastly business; our losses already are very heavy. The London Scottish (the first of the Terriers to come out here) lost half their number in one night's fighting, but one of our officers told me that the German losses were nearly 3,000 in the same fray. Another officer told me to-day that the road between two certain villages about a mile and a half apart was simply strewn with German dead, and was practically impassable. One hears some very funny things out here about the Indians; a party of them left the trenches a few nights ago without their officers knowing anything about it, and arrived back some time later with twenty-five prisoners. No one knows how or where they got them, but this is absolutely true. Poor devils, there is to be no quarter for them if they are captured by the Germans, and incidentally they give little or no quarter when dealing with the Germans.

ARMY MOTOR CYCLES.

A Suggested Combination of Hub and Engine Pulley Gears.

IN the case of motor bicycles used on active service, when reliability is of paramount importance, students of design have noticed with some amount of wonder that the authorities have selected machines of divergent patterns, some with hub gears and others with counter-shaft gears. There is no hiding the fact that hub gears during the past year or two have given a certain amount of trouble. In the ordinary way in the hands of a private owner they will perform satisfactory service for a twelvemonth, but under severe conditions, such as obtain in the Six Days Trials and the T.T Race, the hub gear has its shortcomings. The same remarks must undoubtedly apply when used in the severe work of a despatch rider, who is constantly ploughing his way on the lower gears over extremely rough surfaces and along muddy lanes badly cut up by heavy transport One can imagine the plight of a rider of a hub-geared machine with his gear gone wrong and with only a single gear to get him up a steep hill, or past that long transport train ahead which has left barely room for a bicycle to pass.

Now, seeing that hub gears are not by any means proof against trouble, it is somewhat surprising that the authorities have not considered the possibility of safeguarding hub gear users against defects. It has occurred to me that the combination of a variable engine pulley gear, such as the Philipson pulley, and the three-speed hub gear, would help a despatch rider out of difficulties of the kind enumerated, for not only does the fitting of a variable engine pulley dispense with the necessity for changing gear on many occasions, thus saving wear and tear in the hub, but also in case of the hub gear failing altogether the belt rim could be fixed to the spokes, and the variable pulley relied upon solely. This may seem an extreme measure, but nevertheless when safe delivery of a despatch may mean all and everything for the safety of an army, safeguarding methods of this kind must sooner or later be resorted to. Again, now that Russia is cut off from supplies of spares by the clutches of winter, any hub gear failing among the Russian army machines will incapacitate that machine almost entirely, as single gears are of little or no use in an army. Supposing that a supply of variable pulley gears were available for such breakdowns, the machines could again be made to perform useful service. PERFECTA.

SOME TWO-STROKE TIPS.

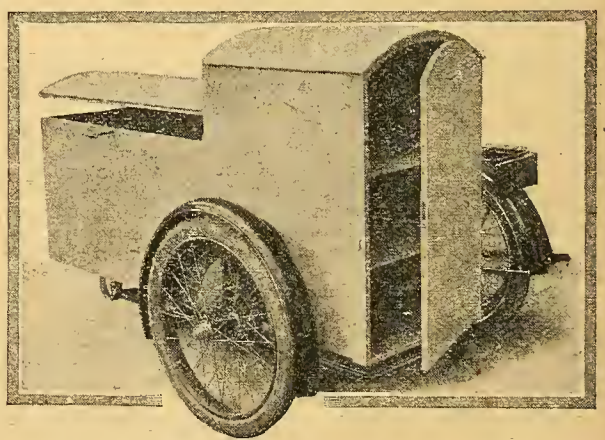
IN theory a two-stroke engine should maintain its power without other attentions than the periodic removal of carbon deposits. In practice this ideal perfection is hardly attained, and I propose to indicate the two or three very elementary details which might trouble a novice in the early weeks of possession. Oddly enough, all my 1914 two-strokes (three, of different makes) have misbehaved in precisely the same way during their first month on the road.

In each case the compression has gradually grown weak. In two cases the upper piston ring had stuck in its groove, in the third case the compression release valve failed to close tightly owing to fragments of carbon between face and seat. All three engines were cured by plenteous libations of paraffin, no part being dismounted for the purpose. Since the piston ring troubles occurred, I have found a preventive measure of some service, viz., injecting about a dessert spoonful of paraffin into the cylinder whenever the engine has got really hot on a long run, and a good deal of oil sludge might be expected to be present in the cylinder.

Secondly, it appears to be necessary to clean the sparking plug once a week and to use a plug of exceptionally long reach. Carbon deposits on the plug are rapid and heavy in character, and at low speeds of revolution, *e.g.*, in starting from cold, the current is very apt to prefer the short circuit provided by a film of carbon to the open gap between the points.

Thirdly, the carburetter requires far more frequent cleansing than on a four-stroke. On my present machine, a week's hard work casts quite an appreciable amount of thick black ooze into the carburetter, which will occasionally choke two of the penthouse jets in the Amac; moreover, perhaps because the tank is a cheap one, the gauze filter under the float chamber usually holds several blobs of a green chemical deposit; I always know when these are forming, because the carburetter floods so slowly when tickled. I do not remove the filter, because it is easier to clean it than to clear the jet.

Fourthly—and here I come to a curious point—the magneto of a machine purchased since war broke out has given quite unusual trouble, and there are indications that it has been assembled out of a job lot of parts made in different years. For example, the contact-breaker details date back to 1909 or so, though the high-tension terminal is 1914. A record amount of oil is always found lurking behind the contact-breaker, and I detach and clean this every week. I find that two-stroke engines seem far more sensitive to the width of the break between the contact-breaker platina than four-stroke engines.

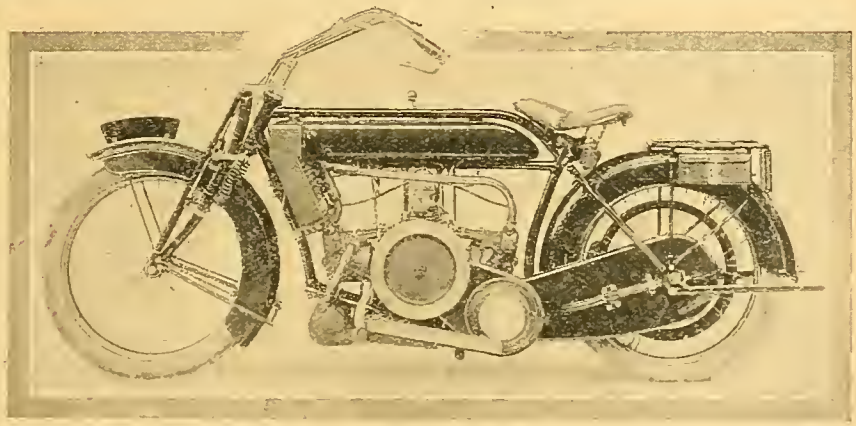


Messrs. Mills-Fulford, Ltd., have introduced another design of side-carrier which we illustrate above. It is particularly roomy, and the rear portion, as will be seen, is provided with shelves.

A 6 h.p. Horizontal Twin Humber.

A Water-cooled Sidecar Machine; Three-speed Box; Enclosed Chain Drive.

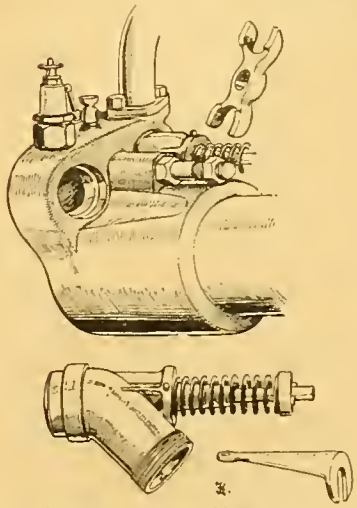
ONE of the most striking designs for 1915 which we have had the pleasure of inspecting is the 6 h.p. horizontal twin-cylinder water-cooled Humber. Apart from the fact that the principle of a horizontal twin has been adopted for the first time by the Humber Co., the engine itself possesses many new features and practical points of real interest. For instance, the cylinders are not in line, which allows of big end bearings of exceptionally large dimensions. The crank is a plain one of nickel steel, and the big end bearings measure 35 × 30 mm. Above the crankshaft and driven by a train of gears is a case-hardened steel camshaft formed from the solid and running in ball bearings, the cams operating direct on to adjustable tappets. The valves themselves are practically horizontal and arranged above the engine. The starting handle engages with the camshaft, thus giving a 2 to 1 gear, and making the starting comparatively easy.



Flywheel side of the new horizontal engined Humber.

Detachable Valve Pockets.

A practical feature of the engine is the detachable valve pockets, each pair of which are held in position by a yoke and a stout nut and bolt. By removing this single nut the yoke may be detached and each valve withdrawn separately, complete with its seating. It is almost unnecessary for us to emphasise the advantage of such a system, in view of the fact that the condition of the seating may be inspected with the greatest ease, and, moreover, the valves may be ground into their seatings in the clear view of the operator; but this is not all. An expedient which will undoubtedly be followed by users of horizontal twin Humbers will be to carry a spare seating and valve complete, so that, should the compression show signs of weakening after prolonged running, it will be the work of but three or four minutes to fit a new valve and new seating, and thus restore compression. The fact that the valve ports are not water-cooled, although the remaining part of the cylinder is liberally water jacketed, may cause surprise at first, but the experiments which the Humber Co. have made include a test of the design in an air-cooled form, and it has been found that the valves and their seatings have stood up wonderfully well. It is, therefore, practically certain that, working under the much more favourable conditions provided by a water-cooling system, the life of the valves and their seatings will be greatly prolonged. A Hallite washer is used for the joint, which is found to be superior to the copper and asbestos type of washer for this purpose. The sparking plugs are in a most accessible position. The cylinders can be removed without disturbing the crank case.



Showing one of the Humber valve ports detached complete with valve, and the yoke securing each pair of valves to the cylinder.

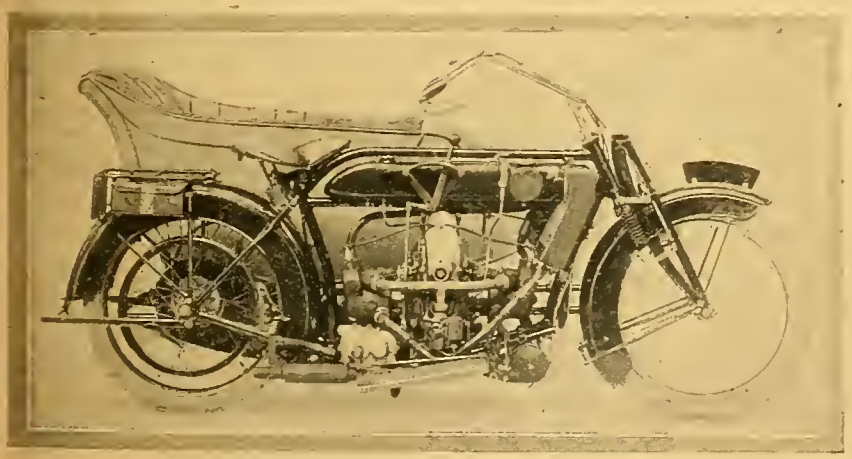
As regards the lubrication system, the splash feed is relied upon. The pistons have flat tops and a pair of rings. The crankshaft revolves on ball bearings, a double row of bearings being arranged on the flywheel side and a single bearing on the timing gear side. The oil retainer on the flywheel side is of interesting design, as it has phosphor bronze rings, which are kept in contact by the pressure in the crank case. We are told that this system works perfectly. The engine is secured to the frame, top and bottom, the top connection being affixed to the lower tank tube.

The cooling is on the thermo-syphon system, pannier radiators of one gallon capacity being arranged immediately behind the steering head and connected to the petrol tank. The circular oil tank is fitted into a recess of the petrol tank in the usual Humber manner.

Gear Box and Clutch

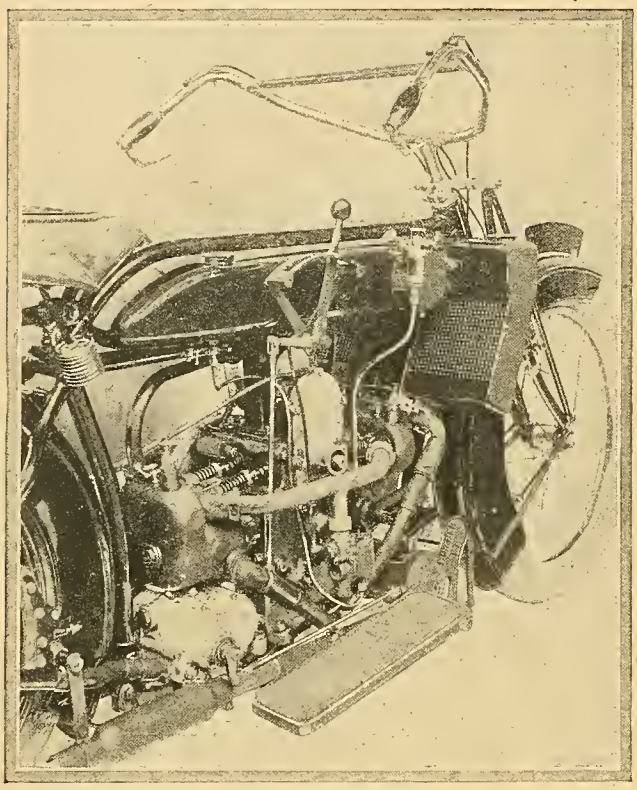
The gear box has three speeds, the shafts revolving on ball bearings, and the operations being effected by a single sliding wheel on a double dog clutch system. The gear ratios provided are 4.76, 7.33, and 13.8 to 1. The chain transmission is enclosed in oiltight cases.

A multiple-disc clutch is mounted on the main gearshaft, and is designed to stand any amount of slipping. Four rings of Ferodo are utilised as the slipping medium. The chain wheel, besides being sandwiched between Ferodo rings, has another member clawed to it again working between Ferodo rings. It is controlled by a foot clutch, a quick thread screw on the right-hand side operating a rod in the hollow shaft. A gate change lever is provided, two free engine positions being obtained.



Carburetter side of the 1915 model 6 h.p. twin Humber.

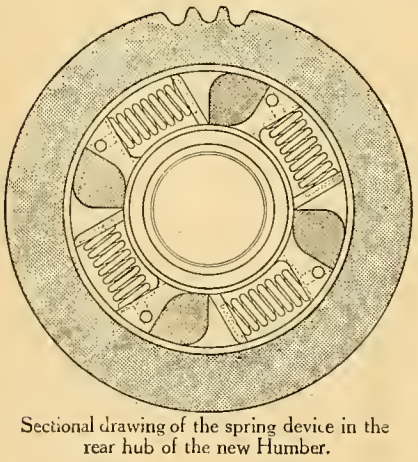
A 6 h.p. Horizontal Twin Humber.—



The new 6 h.p. Humber engine, which is of the horizontal type and water-cooled.

A detachable rear wheel, made under the Lea-Francis patent, is another feature, and mounted within the hub is a slipping clutch device which is very efficient in practice, the snatch of the engine being first taken up by the spiral springs and the recoil by the rubber buffers.

The detail work of this new Humber has received careful attention. We noticed that the links of the Druid spring forks—a source of wear, especially with sidecar outfits—are designed so that each wearing face in contact is of hardened steel. Moreover, each securing nut is of the castellated type with split pins. A Rotherham petrol filter gauge and filler cap has been adopted as standard, whilst a sight feed drip lubricator is mounted in a convenient position at the forward end of the tank. The silencing is well carried out, a separate pipe leading to a large expansion chamber in the front, an extension pipe being carried to the rear, near the end of which another chamber is formed.



Sectional drawing of the spring device in the rear hub of the new Humber.

The Running of the Engine.

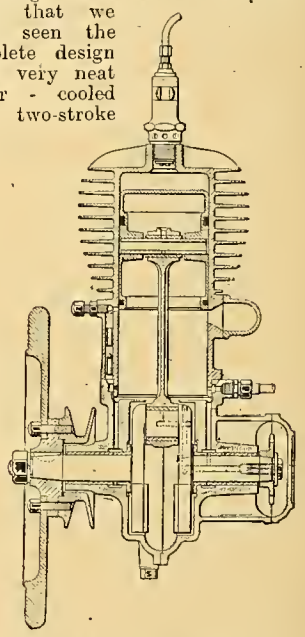
With the Claudel-Hobson carburetter the engine is one of the most controllable we have seen, and another good point that impressed us was the comparative silence of the valve gear. No doubt some of this silence may be put down to the water-jacketed cylinders, which are devoid of that ring which is so noticeable in an air-cooled casting. The engine would tick over so slowly that it was possible to count the explosions, and it will at once roar away on the throttle being swept open. The note of the exhaust is particularly pleasing.

The new 6 h.p. Humber is bound to make a strong appeal to that growing section who favour the moderate-powered twin-cylinder sidecar outfit, especially as the Humber will be sold complete with a handsome coachbuilt sidecar. The 6 h.p. twin and the 3½ h.p. air-cooled models—close upon four hundred of which, as we have mentioned, have been supplied to the Russian Government—will form the two patterns of Humber motor cycles which the company have decided to market in 1915.

THE VITESSE ENGINE—SINGLE AND TWIN.

THE Vitesse Engine Co., who have moved their works to Broad Street, Birmingham, have there erected a completely equipped factory, and are turning out a considerable number of their little two-stroke engines, which are being used by one of the largest manufacturers of two-stroke motor cycles. The engine, which has been previously described in *The Motor Cycle*, is most carefully designed, and the workmanship can hardly be excelled. One of the most interesting features is the lubrication system, which is most thoroughly carried out, and can be followed at once by reference to the appended section. Oil is led to a well round the bottom of the piston, whence it flows through ducts to the crankshaft bearings and through the drilled crankshaft to the big end. Besides this, however, a passage is formed at the side of the cylinder which contains a simple form of ball valve. At a certain point in the piston travel this passage is momentarily connected to the inlet port by means of the hollow gudgeon pin, and thus the ball valve allows a small quantity of oil to pass and to lubricate the small end bearing from inside. A small lead is also arranged through the crankshaft to pass oil to the magneto chain, which is kept just moist by the centrifugal action of the sprocket throwing the oil from the central lead.

Mr. Richards, the designer of the engine, has had a very wide and varied experience of two-strokes, both in this country and America, and the extent of his knowledge becomes obvious from a careful study of his engines. Some novel features are likely to appear on this engine in the near future, but at present we are unable to divulge the secret. We may, however, state that we have seen the complete design of a very neat water-cooled twin two-stroke at present on the stocks. The engine is fitted with roller bearings throughout, and has a central flywheel something after the manner of the Scott. The built-up crankshaft is a clever piece of work, and a simple and ingenious form of crank case pressure gland is used. The exhaust gases pass out at the sides of the engine, so that the pistons are set with their baffle plates facing each other. The whole design is most interesting.



Section of the Vitesse engine.

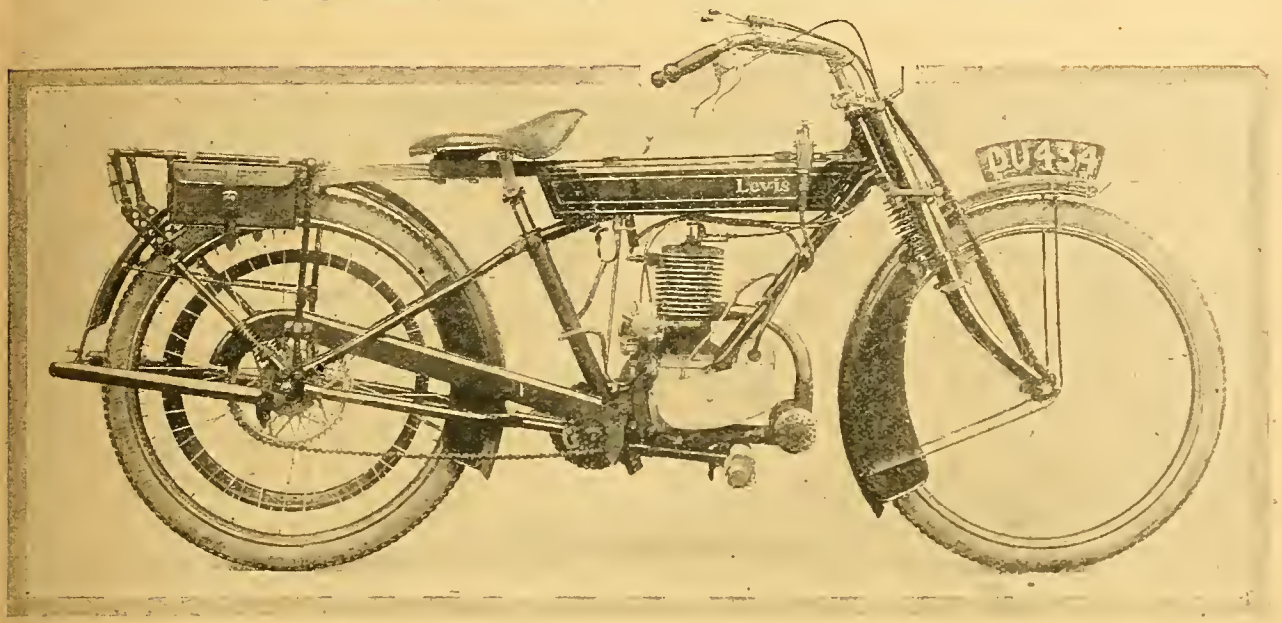
BUYERS' GUIDE OF 1915 MODELS
December 10th.
EQUIPMENT NUMBER.

An Experimental Levis.

Spring Frame; New Engine; Enfield Two-speed Gear.



An experimental model spring frame Levis, a trial of which we refer to in the accompanying article.

WE have recently had the pleasure of some road experience on a forerunner of a very novel Levis. It is to be understood that the machine was purely experimental, though, in all probability, the finished article will be produced some time during the coming year. At present, however, it is not to be marketed in any form.

The most striking feature of the test machine is the adaptation of the Edmund spring frame. The top tube is hinged close to the head lug and carries two separate tanks arranged pannier fashion. These tanks are connected by a branch petrol pipe, and a special flexible tube conveys the fuel to the float chamber. The whole saddle and carrier are suspended on laminated leaf springs with coil spring shock absorbers to take up the smaller shocks, and a simple adjustment is provided to adopt the device to the weight of the rider. Druid forks attend to the front springing, and 26in. wheels help towards the general comfort. The machine we tried was fitted with a standard engine, but it is intended finally to utilise quite a new engine, designed somewhat on the lines of the Levisette. It has a single large inside flywheel mounted on two roller bearings on the driving side; a roller big end is also used, and a light lever is carried round by the crank pin to drive the magneto, which is mounted in line with the crankshaft on the opposite side to the driving shaft. The cylinder has a bore and stroke of 60 × 70 mm. respectively, and the inlet pipe is cast integral with the cylinder, and lubrication is by drip feed to a cast ring round the cylinder base, which, it is not generally known, forms the subject of an early Levis patent. The engine is surely the limit of accessibility, for, after removing the three holding down nuts and the cylinder, one side of the crank case, complete with magneto and magneto drive, can easily be removed with no possible fear of wrong timing when reassembled. The whole interior is then laid bare for inspection or cleaning purposes, and the piston and connecting rod can be slipped off the crank pin without any trouble.

An entirely new design Levis engine having an inside flywheel and a magneto bracket cast with one side of the case (which is removable), thus doing away with transmission.

A two-speed Enfield gear, comfortable footboards, ample mudguarding, and a large pan saddle are to be fitted, and the machine will be turned out with a full equipment and excellently finished.

Its Comfort on Pot-holey Surfaces.

On the road we can testify to the smoothness of the springing, and even over the worst parts of the Birmingham-Coventry Road it was possible to travel at quite a smart pace, not only without discomfort but with the peculiar floating motion of a really well sprung car. It was interesting to note, when travelling over bad roads, that the vibration of the machine, due to small road shocks, was almost entirely eliminated before reaching the saddle or carrier.

When finally marketed, this new type is to replace the present Baby Levis, and no attempt has been made to produce a cheap machine. The best only is the idea for this model.

With regard to the standard models for next year there will be but little change. The steering head ball races have been improved, somewhat larger saddles are fitted, and a better tank finish is employed.

The price of the popular model has been reduced to £25, that of the No. 1 2½ h.p. model to £33 10s., and that of the 2¾ de Luxe to £38 10s. Either of the last mentioned pair may be fitted with a two-speed counter-shaft gear at £6 10s. extra.

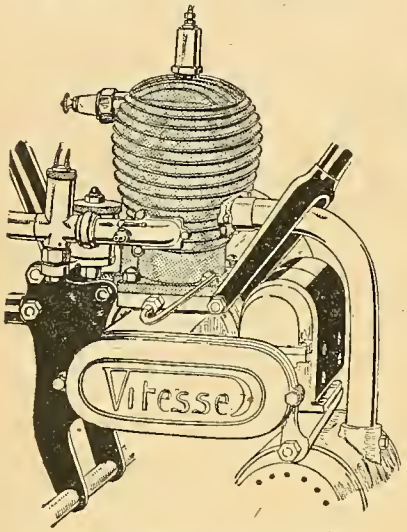
Another Well-known Rider Joins the Colours

We learn that E. A. Colliver, one of the leading lights of Godfreys, Ltd., and a well-known Indian exponent, is now a second Lieutenant in the Mechanical Transport Section of the 2nd London Territorials.

BQ

SUN MOTOR CYCLES.

THE Sun Cycle and Fittings Co., of Aston Brook Street, Birmingham, is specialising on two-strokes, and is busy turning out almost every possible type of machine with 2¼ h.p. engines The following list of models will give a good idea of the range which the company manufactures. The Sun de Luxe is fitted with a Vitesse engine, Thomson Bennett magneto, Albion two-speed and clutch, sight feed lubrication, and Brooks B190 saddle.

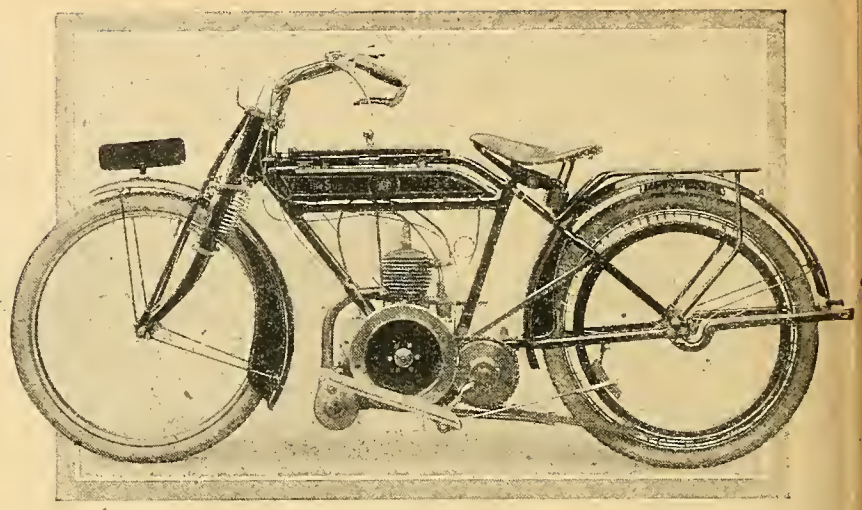


The Vitesse engine unit which is fitted to Sun de Luxe machines.

Another similar model has a Chater-Lea two-speed and no clutch, and a single-geared machine can be obtained with either Villiers or Vitesse engine. A two-speed machine with a Villiers engine is also listed.

Both Villiers and Vitesse engines have the same capacity, and it will be sufficient to describe the de Luxe model as the latest and most complete type turned out.

The Vitesse engine is very neatly designed and well constructed, and has been produced by experts on two-stroke work Apart from the excellence of port design its main feature is the lubrication



Transmission side of the 2¼ h.p. Sun-Vitesse two-speed motor bicycle.

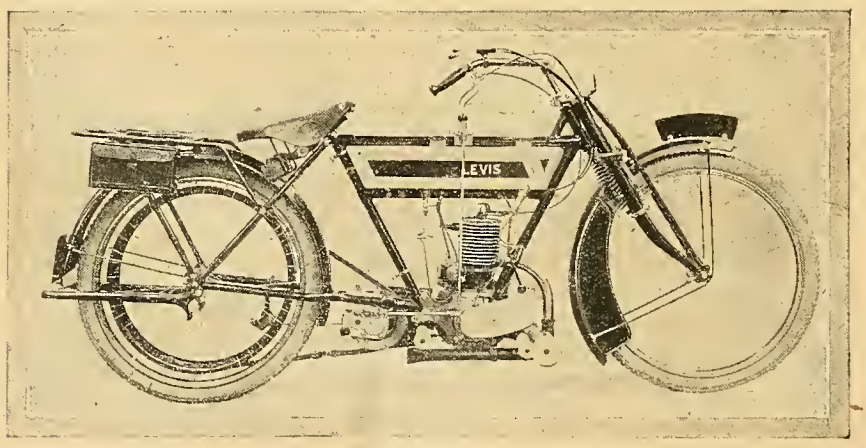
system. Oil is fed from a sight feed drip to a well at the top of the crank chamber. Thence the oil flows to the main bearings and big end, and by an ingenious method employing crank case compression is raised to the hollow gudgeon pin by a lead in the cylinder casting, and special provision is made for lubricating the magneto chain. The magneto is carried in front of the engine on a plate cast integral with the crank case and inner portion of the chain case. A large but neat silencer is attached to the unit, and has an extension pipe leading rearwards.

Two Strokes and Clutches.

Behind this unit and chain-driven therefrom lies the latest type of Albion two-speed gear, the most novel feature of which is the new clutch which is of the cork insert type. It is peculiarly smooth in action and very simple to dismount.

The addition of a clutch to a small two-stroke is a blessing which can only be fully appreciated after a trial, and in the coming year we shall see many so fitted.

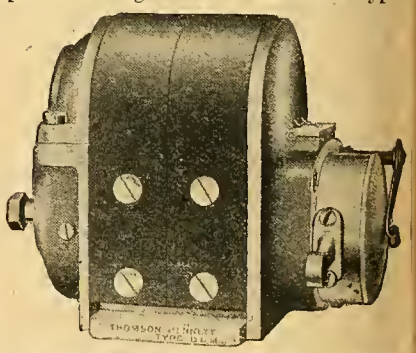
The cycle work is first rate throughout, and 26 × 2 tyres are fitted, while a large and comfortable saddle such as the Brooks B190 is a feature which will be greatly appreciated by all practical motor cyclists. Aluminium footboards, excellent mudguarding, strong but neat fittings, and a fine finish complete a really serviceable and luxurious little machine at a very moderate price.



Specimen of the new 2½ h.p. two-speed, counte.shaft-geared Levis for 1915.

THOMSON-BENNETT MAGNETOS.

WHEN it first became necessary to look around for a home-made magneto many people seemed to forget that a first-class article was being produced—in fact, has been produced for many years—by Messrs. Thomson-Bennett, of Cheapside, Birmingham. Many years ago we had some personal experience with the firm's magnetos, with most satisfactory results, and the machines have been kept up to date in a thorough manner. The design is on standard lines, all parts being solidly and accurately constructed, and, in the modern types, enclosed in waterproof housings. There are three types



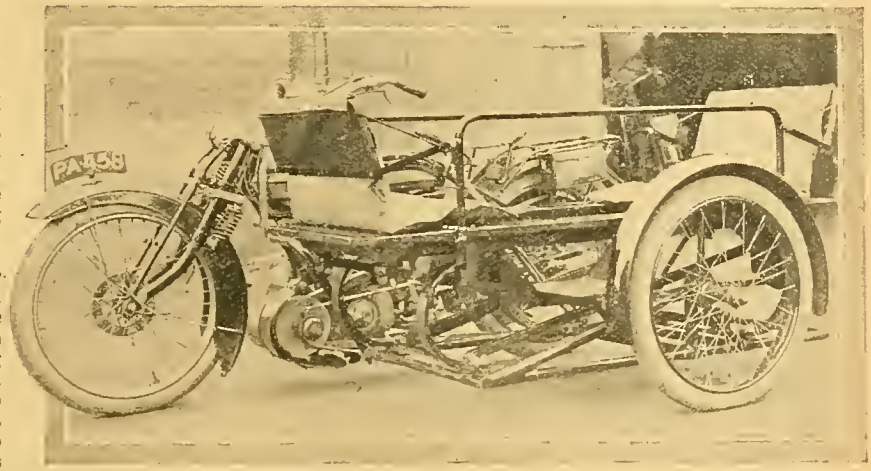
The new Thomson-Bennett lightweight magneto.

suitable for motor cycles—one for twins, one for large singles, and one for small engines or two-strokes. All are on exactly the same lines, and a very simple form of fixing for the high-tension cable is employed. A length of bared cable is turned back into a groove cut in the outer casing. The whole is then pushed into the terminal socket and held by a screw.

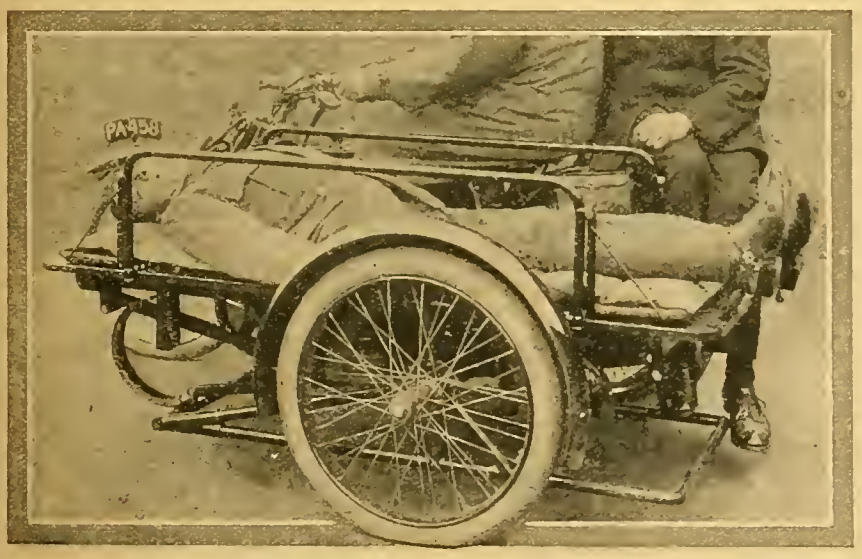
A Zenith Sidecar Ambulance.

Adapted for One or Two Persons. Efficient Springing.

A MOST interesting vehicle which we noticed on the occasion of a recent visit to the Zenith Works, Hampton Court, was a new ambulance, a design which has been patented by Mr. F W. Barnes. It may be remembered that years ago the first spring frame Zenith worked on the scissors principle, a principle upon which Mr. Barnes pins his faith, as he has embodied it into the springing arrangements of the Zenith ambulance. The illustrations show how this is carried out, and it will be noticed that the four parallel cross members have one end bolted to the ambulance body and the other to the frame, the other connection between the frame and the body being C springs, at the extremities of which there are supplementary coil springs to take up the small vibrations. The result of this design is that, no matter where the weight is placed, the springing works in the same manner as if the weight were in the centre. So much for the springing; the body is quite as ingenious.



The Zenith sidecar ambulance arranged to take two people. Note the scissor type suspension.



The Zenith sidecar ambulance for one person.

Our photograph shows that the cushions if pulled away from the centre raise up a short back, so that two slightly wounded men may sit opposite one another, the ample sides providing rests for the legs if necessary, while the bars running lengthwise on each side of the body provide a means for the passengers to hold on. A badly wounded man may be carried in a reclining position, and when the cushions are pushed inwards and strapped together the backs fall out of sight. A cover is provided to enclose the whole of the ambulance, though this is not shown in the illustration. The outfit is designed to carry not only one or two wounded men, but also a hospital orderly on the carrier and the driver in the saddle. The springing is wonderfully luxurious, so necessary in the case of an ambulance, and reflects great credit upon the ingenuity of the designer.

Enquiries concerning this sidecar should be addressed to Messrs. Zenith Motors, Ltd., Hampton Court.

THE BRISTOL OPEN TRIAL.

WE have already referred to the Bristol M.C.C. open eighteen hours reliability trial, the objects of which are threefold :

A. To enable manufacturers to test and exhibit their 1915 models.

A. To enable manufacturers to test and exhibit their 1915 models.

B. To enable prospective despatch riders to test themselves and their machines.

C. To assist a patriotic fund.

The start will take place on the evening of Friday, the 27th inst., and the finish will be on Saturday afternoon.

The route and first man's time will be as follows: Start from headquarters, the Queen's Hotel, Clifton, 9 p.m.; Bridgwater, 10.42 p.m.; Porlock (control), 12.18 a.m.; Lynton (timed check), 12.54 a.m.; Barnstaple, 1.45 a.m.; Launceston (timed check), 4 a.m.; Tavistock, 4.39 a.m.; Two Bridges, 5.3 a.m.; Ashburton (control), 5.39 a.m.: Exeter (timed check), 6.36 a.m.; leave at 8.6 a.m.; Sidford, 8.48 a.m.; Lyme Regis (control), 9.33 a.m.; Bridport, 10 a.m.; Dorchester, 10.45 a.m.; Blandford (timed check), 11.33 a.m.; Shaftesbury, 12.9 p.m.; Frome (control), 1.21 p.m.; Bath, 2.6 p.m.; Bristol (headquarters), 2.42 p.m.

The awards given in this trial will consist of gold, silver, and bronze medals.

Solo machines must not have sidecars attached, and passenger machines must carry an adult passenger. Sitting on carrier is barred.

The secretary for the trial is Mr F. G. Cox, 12, Perry Road, Bristol.

M.C.C. CINEMA SHOW.

A cinema show, comprising war pictures, the T.T., and Grand Prix Races, etc., will be held on the 27th inst. Admission will be by ticket, for which no charge will be made. A "cigarette" concert will take place on December 11th—admission 1s.—in aid of the Belgian Relief Fund. Tickets for both entertainments can be obtained from Mr. W. H. Wells, 366, Euston Road, N.W.

A 200 Mile Ti

TWO hundred miles in a day! Such was the fare provided by the Cape Peninsula M.C.C. for the small band of twelve enthusiasts who started at dawn on October 5th (a local holiday) to compete for the Barling Cup.

The roads were in fair condition, and all went well through Paarl and Wellington up the Bainskloof. The latter is a long mountain pass, renowned for its wonderful scenery, typical of South Africa, and a ravine that runs alongside for many miles. The first man to reach the summit was F. H. Fritchley (3½ P. and M.).

Descending over a stony surface towards the Breede River, where, in 1913, competitors were nearly carried away in the then roaring torrent, E. W. Watts (6 Enfield sc.) passed the leader at full speed, and was the first man successfully to cross the deep drift before facing the river. Here Fritchley came to a stop in midstream and subsequently pushed his mount through. J. F. Smuts (3½ P. and M.) and E. G. Alexander (8 Bat sc.) were the only competitors to ride through. The Bat's passenger, barefooted, was ready to jump out as succour, but Alexander's foresight in fitting two separate exhaust pipes to his twin engine, reaching to the height of the saddle, saved the situation.

The sensational killing of a puff-adder, which was caught by Wilmot's wheel, and the appearance of a small army of baboons on the higher slopes of the mountain are incidents worth recording.

A Clever Repair.

V. Cardinal was the first man to reach Worcester, but on nearing Villiersdorp, th

l cheon stop, fate overtook him, both cones o the front wheel breaking
)ne must praise his ingenuity, when later t axle gave way, in executing a makeshift j that carried him through to the end of t journey, but his misfortunes naturally put him out of the leading position, which was distinctly hard luck.

Bidding good-bye to Villiersdorp, a typical South African country place, and its controlling official, contestants followed the road through deep drifts and over the steep Ezerjagt Mountain—an ascent which will not soon be forgotten for the shocking loose and stony surface to the farm, Boentjes Kraal, nestled in the valley below

More Trouble

It was here that J. C. Faure Myburgh came to grief through the front fork parting company. He gladly accepted, after leaving the derelict mount at the wayside farm, the seat offered on the carrier of Alexander's Bat for the remaining sixty miles.

After joining the Caledon-Cape Town Road, F. Barling, the donor of the cup, found his Waterloo at the bridge over the Steenbras River, shedding the sidecar tyre and upsetting his Enfield outfit, while a similar accident happened to the front wheel of S. Knutson's 3½ James when approaching Elsie's River.

That Colonial trials stand out in severity and demand a greater skill of the riders and a notable courage and perseverance in face of the odds was proved once more, as long after night fell only five men had signed in at the finishing point outside the City Hall, and of these three tie for first place.

Result

1. F. H. Fritchley (3½ P. and M.)
1. E. W. Watts (6 Enfield sc.)

What Motor Cyclists on Active Service Really Want.

According to an officer in charge of Motor Cyclists Signal Sections, the comforts most required by despatch riders are warm gloves, scarves, and cigar lighters.

Motor Cyclists' Reserve.

Eighteen motor cyclists have been accepted for service during the past fortnight by the Rev. F. W. Hassard-Short, secretary of the Motor Cyclists' Reserve Committee, Home Counties Division.

The Rudge Year.

The profits of Rudge-Whitworth, Ltd., for the past year represent £16,746 11s. 9d., and a dividend of 6% on the preference shares is being paid. At the annual meeting on Monday it was mentioned that 360 of the 400 Rudge motor cycles ordered by the Russian Government had been safely landed on Russian soil.

Inconsiderate Driving of Motor Vehicles.

At the last meeting of the committee of the Royal Automobile Club a letter was submitted from the Commissioner of Police of the Metropolis stating that the statistics show a disquieting increase in the number of fatal accidents caused by motor traffic in the county of London during the past two months. This letter has appeared in the public press.

In the course of his letter the commissioner says: "The contention has often been advanced that the timing controls are unnecessary for the protection of the public, and are merely vexatious. The record of fatalities seems to dispose of this contention, and the controls have accordingly been re-established. It is, however, a matter for surprise and regret that a section of motor car drivers should have seized the occasion of a national emergency to endanger the public and embarrass the authorities. The proportion of drivers who have thus offended is probably not a large one, and their conduct has perhaps been rather thoughtless than deliberate."

The R.A.C. entirely concurs with the views expressed by the commissioner. If any case of inconsiderate driving by a member or an associate is brought to the notice of the R.A.C. immediate action will be taken.

Colwyn Bay Motor Races.

The motor and motor cycle races held at Colwyn Bay last summer were so successful that the Mersey (Liverpool) M.C. has decided to add another £100 to the prize money, making the cash prizes to be distributed amount to the sum of £260, in addition to cups and prizes in kind to the value of £65, or £325 in all.

Drivers Wanted for Sidecar Quick Firers.

J. H. Kerr, the N.S.U. rider, is one of the motor cyclists accepted by the Admiralty to handle a Scott Maxim. We have already mentioned that a large number of Scott machines fitted with sidecars, mounted upon which are quick firing guns, have been ordered by the Admiralty. An appeal for 300 motor cyclists for this work is published on another page of the present issue.

Belgians' Trip Round Birmingham.

The following letter has been received from one of the Belgian refugees staying at King's Heath by Mr. E. Bastock, who organised a motor trip: "In the name of the Belgian refugees staying at King's Heath, I wish to thank you very much indeed for the delicious attention of having given us the chance of visiting the beautiful surroundings of Birmingham. Will you be so kind to be our interpreter to your friends who so kindly placed themselves at our disposal to make the marvellous trip in the motor cars and sidecars.—T. BORDEAUX."

SPECIAL FEATURES.

ILLUSTRATED DESCRIPTIONS OF NEW MODELS.

DESPATCH RIDER'S EXPERIENCES.

200 MILE TRIAL AT THE CAPE.

Motor Trips for the Wounded.

There are a number of wounded British soldiers at the Coventry and Warwickshire Hospital, and the local club has offered to take them a trip into the country on sidecars and cars.

Case Against Despatch Rider Dismissed.

A case of considerable interest to despatch riders was heard recently by the Exeter magistrates, when H. Parsons was summoned for furiously driving a motor cycle in Bridge Street, Exeter, and also with having no identification plates. The defendant pleaded that he was on urgent official business, and that Government machines required no identification. The case was dismissed.

The War Funds.

The different war funds on Tuesday morning last stood as follows:

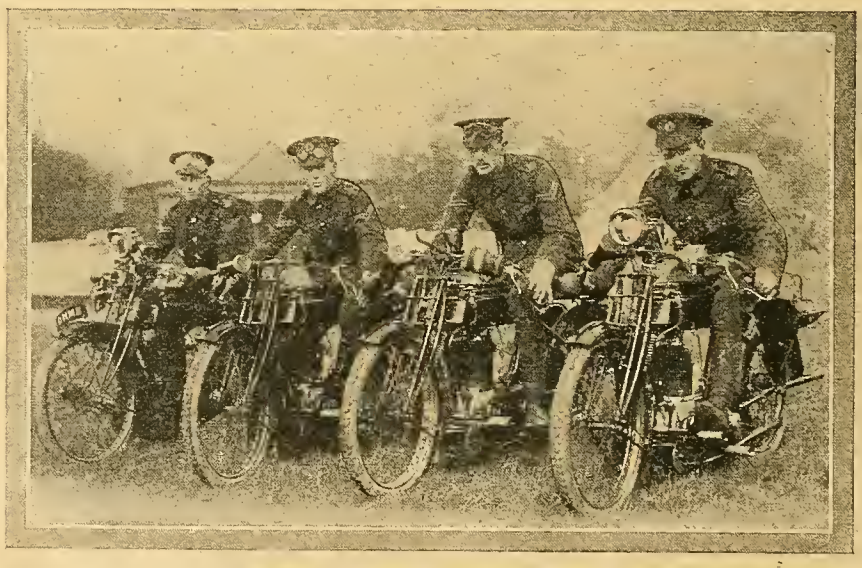
H.R.H. Prince of Wales's National Relief Fund, £3,704,000.

The Queen's Work for Women Fund, £85,758.

H.R.H. Princess Mary's Christmas Gift Fund, £50,000.

The Times Fund for the Sick and Wounded, £588,201.

Indian Soldiers' Fund, £78,204.



Corporals Jardine, Allen, Banner, and Buckley (all mounted on 3½ h.p. three-speed chain-driven Sunbeams), motor cyclist despatch riders attached to the Western Signal Companies at their Headquarters, Wavertree Camp.

Why every MOTOR CYCLIST should carry

HORLICK'S

MALTED MILK TABLETS

These Food Tablets supply sufficient nourishment for hours. They prevent fatigue, relieve hunger and thirst, and being the very essence of wholesome nutrition, they restore energy and strength, and increase the powers of endurance.

ESPECIALLY USEFUL TO

ARMY MOTOR CYCLISTS

The Motor Cyclist who has a supply of Horlick's Malted Milk Tablets is independent of any irregularities in food supplies. They are always handy, and keep indefinitely. No Motor Cyclist's kit is complete without them.

A well-made leather case for attaching to Hand'e-bars or Frame to carry a Flask of Tablets will be sent post free for 1/6, or case and flask complete for 2/6

Flasks at 1/- each, or larger sizes at 1/6, 2/6, and 11/-. May be obtained of all Chemists and Stores, or of us direct by prepaid post.

Liberal Sample sent post free for 3d. in stamps.

NEAT VEST POCKET CASE FREE.

The Standard Handbook of the Motor Cycle.

¶ "MOTOR CYCLES AND HOW TO MANAGE THEM" is unquestionably the best and most complete handbook on motor cycles, their care and management.

¶ It will be found invaluable to beginners, and both useful and instructive to more experienced riders. It deals with a multitude of subjects relating to all types of motor cycles, and matter is also included dealing with cycle cars.

¶ The buyer of a second-hand machine will find the book equally useful, as it describes old type carburetters, ignition systems, etc., in a special chapter on second-hand motor cycles.

SIXTEENTH EDITION
(Revised).

Price 1/- net. By Post, 1/3.

Obtainable from

and all booksellers and bookstalls.

915 Models.

In our special Buyers' Guide number ext week, we shall publish, among other escriptions of new models, photographs nd details of the 1915 pattern B.S.A. nd the new three-speed Indians, which, already mentioned, are twins of 3½ h.p., h.p., and 7 h.p.

Lulu with Harcourt Radiators.

We notice that a cycle car has just ade its appearance from the shops of e Kearns Motor Truck Co. named the ulu. We presume it is fitted with arcourt radiators.

H.M.S.

An order has been issued by the War ffice to the effect that all drivers of otor vehicles must conform to the regutions regarding speed, etc., except in ery special and urgent circumstances. he use of O.H.M.S. in place of the usual entification marks is forbidden.

vo-speed Machines for Russia.

In referring to the Russian Governent's preference for three-speed achines, it must not be supposed that vo-speeders were rejected, as both helon and Moore and the Enfield Cycle o. supplied a good number of machines r the use of the Russian Army, and, as well-known, these machines are uipped as standard with two-speed untershaft gears of the simplest possible pe.

ade in October.

During last month the number of motor rcles exported from this country was 124, against 1,004 in September. uring the same time 280 machines ere imported, which is a large increase rer the September importation of irty-six machines. The October figures r the last three years are given below:

VALUE OF MOTOR CYCLES AND PARTS THEREOF.

	1912.	1913.	1914.
xports ...	£94,325	£90,716	£84,474
nports ...	£41,590	£15,067	£13,239

The number of imported machines must largely increased by the consignment American motor cycles sent to Russia á Liverpool.

xports and Imports.

In spite of the war the exports show considerable increase over the ten onths of last year, the value being only st under one million sterling, the gures being as follow:

MOTOR CYCLES AND PARTS THEREOF FOR TEN MONTHS ENDED OCTOBER 31ST.

	1912.	1913.	1914.
xports ...	£572,065	£820,644	£999,536
nports ...	£173,118	£213,734	£181,248

cing in Italy.

A flying kilometre meeting was held Tradate on the 18th ult. by the Società o Gorla Sportiva. It was raining at e time, and though the road surface as fairly good, the wet caused a good al of belt slipping. Results:

	s.	Speed m.p.h.
500 c.c. CLASS.		
Belfanti (Stucchi) ...	38 1/10	58.8
Ghirlanda (N.S.U.) ...	38½	
Maffeis (Maffeis) ...	38⅗	
350 c.c. CLASS.		
Baj Badino (Douglas)	41⅕	... 54.5
Acerboni (Frera) ...	42⅖	
Scotti (N.U.T.)		

Bristol Open Trial.

An A.C.U. permit has been received for the trial which is fixed to take place on the 27th and 28th inst.

Motor Cyclists Honoured by the French Government.

In the list of warrant officers, non-commissioned officers, and men of the Expeditionary Force upon whom, with the approval of the King, the *Médaille Militaire* has been bestowed by the President of the French Republic for gallantry during the operations between August 21st and 30th, we notice the names of Sergeant C. Q. Roberts, R.E. (motor cyclist), and Corporal W. H. Tait, R.E. (motor cyclist).

The Benevolent Fund Dinner.

We are informed that the usual banquet on behalf of the Cycle and Motor Trades Benevolent Fund will not be held this year, owing to the European war. It is earnestly hoped that members and others will contribute to the Fund, as the longer the war continues the more insistent will become the demands upon its resources. The general hon. secretary and treasurer is Mr. A. J. Wilson, 154, Clerkenwell Road, E.C.

How to Appreciate our Soldier Motor Cyclists.

This journal had already announced its desire to send useful Christmas presents to our brave motor cyclists at the Front, when it was found that Princess Mary's Fund covered the same ground. Her Royal Highness's idea to alleviate the hardships and sufferings of *all* our brave soldiers with the Expeditionary Force is an excellent one, and those who wish to remember our gallant readers who are serving their country abroad should send their contributions without delay to Her Royal Highness Princess Mary, Buckingham Palace, W. Readers should not feel afraid of sending in small amounts; the other day the number of shilling postal orders received totalled £300.

The Patriotic Essex Motor Club.

Thirty-five members of the Essex Motor Club have now joined the Colours. A. R. Abbott, we learn, is now a sergeant in the A.S.C., while another prominent member—Ernest Bass—is also serving his country.

Motor Cyclist Despatch Riders.

We pointed out the other day that it was difficult to find who were motor cyclists in the various official lists published by the War Office. It is fairly safe to assume, however, that those whose regimental numbers run from 28,000 onwards are despatch riders.

Why Does an Engine Konk?

Some interesting replies to the above article are published in our Letters columns this week, including a communication from Dr. Low on the subject. It is curious that the true cause of the metallic knock known as "konking" has never been traced authoritatively, though the trouble is as old as the hills.

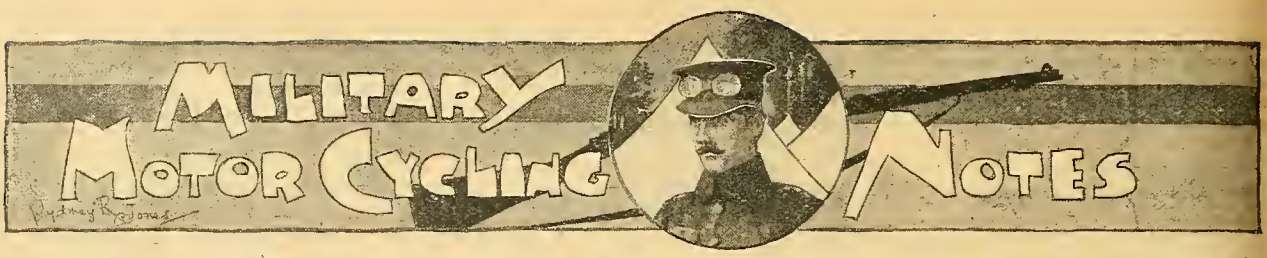
Injuries to Despatch Riders.

Quite a number of our gallant motor cycle despatch riders have returned home injured, but only one of five, whom we have interviewed, has been disabled by the enemy's bullets. Of the other four, one was shot by accident, another fell on the back of his head through striking a hole made by a shell, the third was kicked by a horse and injured internally, and the last unluckily charged a French barricade in the dark.

An Entirely New Design.

The 6 h.p. horizontal twin-cylinder Humber described in this issue is one of the most striking models of motor cycles introduced for 1915. Though the announcement will come as news to motor cyclists, the new Humber is not really new, for we have ourselves seen it many times on the road during the summer undergoing its tests. The secret, however, has been well kept.

THE COUNTRYSIDE IN WAR TIME. A peaceful scene in Richmond Park.



Hub Gears Stand up Well.

A lieutenant in the Army Service Corps writes: "Many thanks for copies of *The Motor Cycle*, which are greatly appreciated by all of us. Our machines are standing up pretty well considering, and the hub gears are not giving much, if any, trouble as yet. The roads are steadily becoming worse, but my boys keep worrying on. Thank heaven! they have any amount of pluck, and so far we have never failed to deliver a message. I am now speaking of my headquarter section. My two divisional sections have not always been so lucky, but all the same they do fine work."

Despatch Riders Wanted.

Mr. Philip Grout, secretary of the Motor Cycle Reserve, South Midland Division, will be in attendance at the Midland Hotel, Birmingham, from Friday afternoon, November 13th, till the following evening, for the purpose of registering the names of motor cyclists, with or without machines, who are willing to offer themselves for active service in the Royal Engineers. Full particulars will be given by Mr. Grout, but for the guidance of those interested the following machines, so far as arranged by the authorities, will be accepted, viz., Douglas Triumph, Rudge, P. and M., and B.S.A.'s, all to be fitted with two or three-speed or variable gears. Pay, 2s. 6d. a day, with engineers' pay of 6d. per day in addition after necessary training. Suitable machines may be taken over by the authorities at a valuation.

Brookdale Club and the War.

No fewer than eighteen members of this flourishing Catford club have already joined the Colours. Of the motor cyclists, one is serving with his 4 h.p. Triumph in the Signalling Section of the Royal Engineers. A relief fund has been opened at headquarters, Brookdale Hall, Catford.

Motor Cyclists Wanted to Serve Their Country.

Having completed the formation of a squadron of over two hundred motor cyclists, who are now attached to the Royal Naval Air Service in connection with the armoured cars' aeroplane support, Sub-Lieutenant Stocks is now looking out for a further three hundred expert motor cyclists to drive motor cycles with sidecars fitted with Scott-Maxims. Two men will be required for each machine, to take turns in driving and in working the gun from the sidecar. A knowledge of the French language, although an advantage, is not essential. Full particulars as to pay, rating, kit, provision of machines, etc., can be had on application, between the hours of 10.30 and 11.30 a.m., to Sub-Lieutenant Stocks, Naval Air Recruiting Station, Wormwood Scrubs, W., or, if it is not possible in the first instance to attend, the information will be sent on receipt of letter to the same address.

Extracts from Corporal H. C. Newman's Letter to his Parents.

"I shall be able to write letters more often now, but before, when I was with the First Army Corps, things were a bit difficult. We were supposed to have been cut up, and I may say we had a very near shave, but thank God for the timely assistance of the Munsters; they were brave men, and stood and fought like lions and saved the situation, but out of 900 men only 120 came out alive. I may tell you I have had a very hard time, as it was only a matter of luck whether I got back alive. I was sent to the 2nd Division headqnarters on the frontier, which was at a place called Vernall, where the shells simply tore down houses, and when I got outside I saw one of our men trying to run on the stump of his leg, he having just before had his foot blown off. I may tell you I am writing this letter in bed, as I am just getting over the fever; this is the first bed I have been in for the last seven weeks, having had to sleep in pigsties on straw, and not changing my things nor even taking my puttees off. My opinion is that the war will last about another four months, but I am satisfied to think I have done my share, even if I do no more. It makes me think that there is no civilisation at all. I have fired some shots, and have had a few spent on me, but have been very fortunate; one gets quite used to the ping of bullets within five or six inches, but a miss is as good as a mile. Well, I will tell you my experiences when I get back. The lorry drivers seem to have a good job, as there is very little risk attached to it." HOWARD.

Top row: Corporal Gore, Sergeants C. Q. Roberts and R. W. Lovegrove. Seated: Corporals H. C. Newman and Boyton, motor cyclist despatch riders on active service at the front.

Letter from A. J. Sproston.

We have received the following interesting communication from Corporal A. J. Sproston in reply to our congratulations to him and his colleagues on their excellent work and special mention in despatches: "Very many thanks for your kind remarks. The congratulations of *The Motor Cycle* staff are duly passed on to the fellows here, and appreciated. I can add little to what you already know as to the motor cyclists' part in this enormous struggle. We continue our hard work over terrible roads, machines standing up to the work in a manner that I should have thought impossible. Some of us are glad at times of the experience we have had of long distance reliability trials. Congratulations to *The Motor Cycle* on its share of bringing the utility of the machine so consistently to the fore. After the war, manufacturers may look forward to big business as a result of the prominence into which the motor cycle has been brought. The riders readily adapt themselves to all sorts af trying conditions. Personally, I started off with a Rudge, which did excellent service. Not once did it leave me in the lurch; handed it over after about 3,000 miles to another rider. Present machine T.T. Douglas, which is very handy for negotiating muddy side roads and fields. Falling into shell holes, running into barriers and waggons (we rarely ride with a light at night), left in the rain all night, these things have little effect on these sturdy little bicycles. Regret to hear there will be no Show. I think it will be found that this decision is unwise, and not in accordance with the 'Bnsiness as usual' motto. Again, many thanks, with best wishes, and in haste.—A. J. SPROSTON.

Ancient bridge and toll gate at St. Ives, Hunts.

A FEW weeks after war was declared I attempted a photographic tour with a motor cycle and sidecar through Cromwell's county—Huntingdonshire. Difficulties in obtaining petrol would be, I imagined, the only drawback to normal times; so tucking a couple of cans of the precious spirit in the toe of the sidecar and indifferent to the grumbles of my passenger, I, so to speak, weighed anchor. Huntingdon was to be our headquarters, and we arrived there one evening as twilight was creeping over the town. Instead of rural peace, the usually quiet and old-fashioned town was a scene of animation. Crowds of khaki-clad soldiers, on their heads the Glengarry bonnet, thronged every street and byeway, and motor cyclist despatch riders sped past at a pace that only a month before would have caused their appearance before the local magistrates. We learned that the Forfar and Inverness Territorials were encamped there. The wild strains of the bagpipes could be heard as squadrons marched past. During the earlier hours of the day, Portholme, once a racecourse, but now used as an aviation ground, was monopolised by the troops for drilling and manœuvring. Photography seemed out of place amid so much turmoil, so we packed our traps and made for the open country.

An Air-propelled Boat.

I noticed in Huntingdon close by the river bridge a large house that had been purchased by the A.A. to turn into a kind of club house for motorists. The house was undergoing alterations; builders and painters were busy inside and out. Another object which held our attention was a rowing boat that had been fitted with an early type Douglas engine—apparently there is no rest for such even when they have finished their work in a motor cycle frame. Instead of driving an ordinary screw this was fitted with an air propeller. I was informed this was preferred to a screw, as the river was so weedy that the screw would become fouled and so cause trouble. This fitment transformed a one-man power skiff into a neat little motor boat, a brilliant idea which deserved to meet with success. Driving on to St. Ives, the historical town where Oliver Cromwell lived about 250 years ago, we saw the quaint old bridge over the Ouse, which has a cottage and ancient toll house actually built in it. This is still in good condition, although the tolls for ordinary travellers have long since been abolished. Drawing the sidecar to the roadside, my passenger and I were in the act of erecting the camera when a special constable appeared on the scene. He examined my licence and wanted full particulars of our reasons for using a camera, our headquarters, and nationality. He certainly left no stone unturned to satisfy himself that we were British.

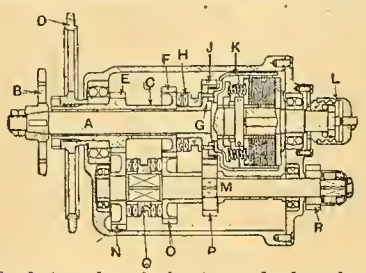
Despatch Riding No Game for Ladies.

We decided that the camera should be put aside until such a time that warfare is history only. Recently I have read in the current press of lady motor cyclists who have offered their services to the War Office as despatch riders. Personally, I imagine there are many ways preferable to such strenuous service in which my sex can assist. Few lady riders could be other than unfit for the hardships that must naturally accrue. Why even the Six Days Trials, from which we are debarred from competing, would be mere recreation compared with despatch riding on the frontier. Making garments for our soldiers would be more practical, even if more modest.

Until a few days ago the methods of the road pickets were but tales to many of us. Chancing to return from visiting a friend one evening at dusk, I was confronted by lights that were suspended across the highroad near Dunstable. A number of "Terriers" in charge of a sergeant and an officer were lined across the road, and all travellers and wayfayers were met with the military challenge "Halt!" Licences having been produced and examined, the company made way for us to pass on, the sergeant kindly offering me a "push off." These incidents are interesting by reason of their very novelty, but still I doubt if there are any among us but hope for the days when arms are laid aside and peace is once more universal.

B.S.A. Three-speed Gear B-

The shaft A is the driven shaft of the gear and carries a sprocket B, by which the motion is taken to the rear wheel. The driving element is the sleeve C, which receives motion from the chain wheel D. Integral with the sleeve C are two gear wheels E and F of different diameters, whilst a second sleeve G upon the shaft A is provided with a dog clutch H adapted to engage a corresponding dog clutch on the adjacent gear wheel F. This sleeve also carries a third gear wheel J, and is extended to form the outer member K of a plate clutch. The inner member of this clutch is com-

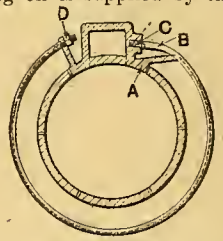


prised by the shaft A, and the clutch itself comprises interleaved plates engaged by splines in the usual way, operation of the clutch being effected by a push rod acted upon by a screwed cap L. The countershaft M has freely mounted upon it gear wheels N O, permanently engaging the gear wheels E and F respectively. A third gear wheel

P is fixed upon the countershaft and engages the gear wheel J upon the sleeve G. Between the wheels N and O is a sliding dog clutch, adapted to lock either of these wheels to its shaft. Suitable mechanism (not illustrated) is provided for actuating the dog clutches. When the clutch H engages the adjacent gear wheel F the driving and driven elements are locked together and a direct drive provided. The second and first gears are afforded by disengaging the clutch H and locking either of the wheels N O to its shaft by means of the clutch Q, when the drive is taken from the countershaft to the driven sleeve at a ratio dependent on which of the gear wheels N O is engaged. A free wheel pinion R is carried on the countershaft, and is engaged by the sector of a kick-starting mechanism (not shown).—The Birmingham Small Arms Co., Ltd., and R. Nicholls, No. 13,574, 1913.

The Peco Lubrication System.

Lubrication of the Peco two-stroke engine is effected by means of a positive supply passing through the cylinder walls, ducts being provided to conduct a supply to the crankshaft bearings and to a sump at the bottom of the crank case into which the big-end of the connecting rod dips. The cylinder casting A is formed with two ribs cast close together, and the space between these ribs is enclosed and rendered oil-tight by means of a wire B passing between their outer edges. This wire is screwed into the cylinder casting at one end C, whilst the other end passes through a projecting part of the flange, and is adapted to be tightened up by means of the nut D. Thus an enclosed chamber is provided to which lubricating oil is supplied by the pipe E.



The oil in this chamber finds its way into the cylinder through small holes, lubricating the piston and cylinder walls. To lubricate the crankshaft bearings the crank case is formed with passages, by which some of the oil reaches the points desired. After passing these bearings the oil falls into a sump at the bottom of the crank case into which the big ends dip at each revolution.—D. A. Pearson, No. 22,279, 1913.

Magneto Spares in War Time.

Taking into consideration the difficulty in getting foreign magnetos and spare parts during the present international crisis, Messrs. Simms Motor Units, Ltd., 191, Wardour Street, W., have made special arrangements to produce spare parts for all makes of magnetos on a large scale, and have increased their magneto repair shop to cope with all the demands that are made.

How to Keep Dry.

Now that the wet weather is beginning, after the long spell of drought, the catalogue of Messrs. J. Barbour and Sons, Ltd., South Shields, should be in the hands of every motor cyclist. In it will be found illustrations and descriptions of all kinds of waterproof garments, from head coverings to boots, several of the suits being especially designed for use on a motor cycle, both in Beacon oilskins and rubber-proofed suits.

A Despatch Rider's Experiences at the Front.

A letter has been received by the Dunlop Rubber Co. from Corporal J. K. Stevens, R.E., a despatch rider, who details his experiences while on service with the British Expeditionary Force. The corporal, who was one of the first motor cycle despatch riders to go to the Front, states that in three weeks' riding he travelled well over 2,000 miles with only one puncture. "The roads in Belgium," he continues, "were some of the most fiendish imaginable, and I frequently rode across fields of stubble and tracks of all descriptions. This shows that Dunlop tyres are the best and wear the longest, for active service is a sure test of endurance and fitness."

A New Appointment.

We extend our congratulations to Mr. Fred Starr on his rapid recovery from his recent accident, and also on his promotion from secretary to general manager of Hobart Bird and Co., Ltd., Coventry.

The Piccadilly Rifle Range.

It will interest our readers to know that there is a rifle range at 67b, Shaftesbury Avenue, where there are a dozen targets and modern fittings. All visitors connected with the Services are made honorary members.

Trade Announcement.

We are asked to state that the Gaby Motor Co., 37, County Buildings, Corporation Street, Birmingham, and the Metro Co., Adderley Road, Saltley, Birmingham, are in no way connected, although the engine unit fitted to the Gaby is made by the Metro Co.

An Autumn Sale.

Messrs. John Piggott, Ltd., are now holding an autumn sale, at which bargains in motor cycle clothing and accessories may be purchased. Special attention is given to motor cycle suits, gloves, etc., for winter wear, and outfits for despatch riders.

F.R.S. Lamps in Coventry.

Mr. J. Robert Reid, 1, Chester Street, Coventry, has been appointed agent for F.R.S. lamps in Coventry and district.

A War Office Order.

Zenith Motors, Ltd., inform us that they have received an order for a number of their single-cylinder machines from the British War Office.

New Precision Designer.

Mr. T. J. Biggs, who has been chief designer to Arrol-Johnston, Ltd., and Humber, Ltd., has lately been appointed chief designer to F. E. Baker, Ltd.

Hutchinson Tyres.

M. L. Arnaud, who for a long time was London manager of the Hutchinson Tyre Company, has been fighting in Eastern France, and was recently taken prisoner by the Germans and is now at Ulm. No less than 1,512 people from the Hutchinson factory in France have joined the Colours, and many have gone from the London depot. Despite this, the delivery of tyres has been in no way affected.

Attractive Accessories.

The Kumfort Motor Accessories Co., Cookham Rise, Berks., has been formed to place upon the market the different patents of Mr. F. Waigh, which have formed the subject of articles in past issues of *The Motor Cycle*. The patents in question consist of a highly efficient front wheel mudshield, a rear wheel carrier, pannier boxes, hammock footrests, besides a combination map, memo, and carrier for light articles for affixing to the centre of the handle-bars.

IN WAR TIME

as well as in peace SPLITDORF American IGNITION can be depended upon to give the rugged service that means endurance.

Magnetos, plugs, transformers, starting and lighting outfits—all SPLITDORF units are GUARANTEED.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed. "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Son: Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Abingdon.

ABINGDON, 1913, 3½h.p., 3 speeds and clutch, splendid condition throughout, lamp, horn, tools, etc., complete; £32 cash, or extended terms arranged. —Elce and Co., 15, Bishopsgate Av., Camomile St., London, E.C. [0552

THE REASON why GODFREY'S have such an enviable reputation amongst motor cyclists is simply because they

KNOW WHAT TO BUY AND HOW TO TREAT THEIR CUSTOMERS.

EVERY SECOND-HAND MACHINE RECEIVED INTO GODFREY'S STOCK IS TAKEN TO PIECES, THOROUGHLY EXAMINED AND BROUGHT UP TO GODFREY'S STANDARD OF MECHANICAL EXCELLENCE. WHEN IT IS SOLD IT IS BACKED BY GODFREY'S GUARANTEE, WHICH IS NOT A MERE SCRAP OF PAPER.

GODFREY'S have a grand stock of both new and second-hand machines in their showrooms, and the prospective buyer is cordially invited to call and inspect the various models.

BEFORE DECIDING ON YOUR 1915 MACHINE CONSULT GODFREY'S.

Write for full lists or for advice if you need it—it is freely at your service with no obligation on your part to place an order.

Reliance

SPARK PLUG

See "Ixion's" remarks in "The Motor Cycle," 22 Oct., pp. 456.

A TESTIMONIAL.

15th Sept., 1914.

"I may say that myself and several friends who use the **RELIANCE** Plug have had every satisfaction, and have never once had an oiled or sooted plug.

"I have had considerable experience with plugs of other good makes, but have never had such good results as with the **RELIANCE.**"

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

The RIGHT DESIGN

"IXION,"

in "The Motor Cycle," Oct. 22, says:

"I find that some manufacturers fail to grasp the special problem presented by the modern plate fastener in conjunction with a ¾in. belt on a lightweight machine. Supposing the width of the end plate be half an inch, its edges can only clear the pulley by ⅛in. on either side at the very best. If the frame be even a trifle out of truth, or apt to whip, if the rear belt rim be mounted a shade out of truth or become strained, if the fastener be carelessly fitted on the skew, if the back wheel be not adjusted absolutely plumb in the rear forks, the edges of the end plate are bound to foul the pulley flanges. . . . The unfortunate owners suffer from belt troubles, and their pulleys get damaged."

Now LOOK at this illustration of the famous

STANLEY

BELT FASTENER.

It will be seen that the lower plates are cut away in order to avoid the trouble referred to, whilst the maximum of strength is secured by the design—the result of long experience.

Design in 1915.

ON the eve of the Show it is our custom to review features of motor cycle design which mark progress in each succeeding year, and this outline is largely based on the information provided by our annual Buyers' Guide. The Olympia Show having been abandoned this year, the Guide fills an important breach, for not only will buyers find it convenient for reference purposes when deciding upon their new mounts, but the machine specifications are of considerable value in reflecting the trend of modern design and showing how once popular fancies have gradually given way to improved ideas. All this is for the general good in the perfection of the motor cycle, which is, after all, what everyone has in view The Guide throws a searchlight on the path of the manufacturer; he is warned of dark paths by the disappearance of features once the vogue, and knows that to revert to such features before the weak points have been eliminated will be courting trouble.

If we gauge popularity by predominance in numbers, the leading features of design for 1915 are single-cylinder four-stroke engines, all belt transmission, countershaft gears, and as regards lubrication the simple hand pump or drip feed governed by the rider. These facts will cause no astonishment, as they represent no change for the last few years in numerical strength if we except the item countershaft gears. But studied more deeply the Guide shows that in 1915 some of the features enumerated will be closely pressed for supremacy, and next year's Guide will most probably record changes. For instance, how many realised that, so far as four-stroke machines are concerned, the multi-cylinder engine had increased in popularity among manufacturers to the extent of being numerically but little weaker than what we have become accustomed to regard as the all-powerful single?

There are 277 machines included in the Guide, and of these 117 are four-stroke single-cylinder machines, 95 multi-cylinders, and 65 two-stroke mounts. This rapid increase in the number of twins is the more significant when coupled with the knowledge that a number of firms now manufacture twins only—firms, too, who know what a good single-cylinder machine is like.

Those who have predicted the demise of the belt for so many years past will learn with surprise that it is still an easy first, and, in conjunction with the combination drive, totals 207. The figures are: all-belt drive 135, chain-cum-belt 72, chain 64, and shaft 6. Mechanical lubrication, we are glad to observe, shows an increase to twenty-six machines, whilst three-speed geared mounts have jumped to 121. No less than 151, that is 54.5%, of standard pattern motor cycles embody countershaft gears in their specification

The lightweight, especially the two-stroke lightweight, is still gaining in popularity, and next year will see the use of this handy mount still further extended, as it is by far the cheapest form of motoring extant—and this fact alone is a powerful attraction. The lightweight, too, is doing good work as a stepping stone to higher powered mounts.

The automatic carburetter makes very slow progress, but the benefits to be derived from the use of a pilot jet are being appreciated. We note with pleasure the tendency to enclose kick-starter mechanism, it needs but a single long run in bad weather to render exposed gear quadrants very stiff in operation.

It is impossible to dwell upon detail design in this brief review of current tendencies, but from our opportunities of inspecting next year's models, we have formed the opinion that decided progress has been made, in particular concerning increased engine bearing surfaces, countershaft gears, clutches having greatly increased contact surfaces, frame design, and efficiency of two-stroke engines.

AN OPEN LETTER TO THE TRADE.

By B. H. DAVIES.

GENTLEMEN,—Your customers are once more grateful to you for another delightful season, during which the weather has enabled us to make the fullest use of your excellent machines. We are proud to realise that British motor cycles are still the best in the world. We desire to express our sympathy with you in the anxieties and inconveniences which the war has caused, and our congratulations on the fact that you have secured large contracts from all the belligerent nations except Germany and Austria.

Our gratitude for the special favours of the past season centres round three special points—you have brought transmission to such a perfection that the veriest duffer can now climb the worst freak hills with ease and confidence; you have developed the cheap lightweight to an astonishing pitch of efficiency; and you have made marked strides in the reliability and convenience of your minor fittings.

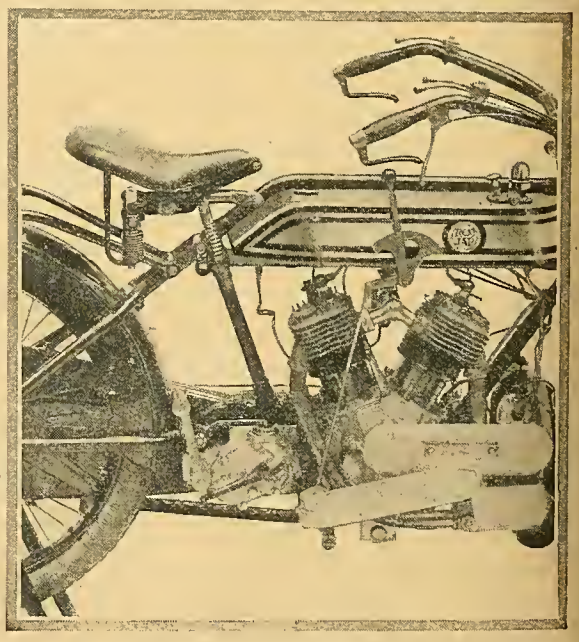
We hear with interest that you are busy planning still better transmissions for 1915, including quite a number of four-speed gears; that you are concentrating on improved lighting systems; that you are extending the "duct" system of oiling, by which a direct supply of oil is assured for the hardest-worked details in the engine; and that your valve gears, on an average, will show very genuine advances.

An Ounce of Practice—

With due deference, we humbly suggest that you are apt to regard the design of a motor cycle as a pure engineering job, and that most of you would do well to employ a practical rider, neither too young nor too dashing, as a check on your brilliant engineers. For you turn glassy and callous eyes in two directions where most of your customers ardently long for determined progress. Your engineers care little about springing; but your clients have sensitive vertebræ and long to see your machines equipped with a light, neat, and efficient system of rear springing which will do for the back wheel what most of your spring forks have already done for the front. Such an innovation would influence more trade than 100 miles in the hour at Brooklands. Further, you obstinately ignore the cleaning difficulty. When a dirty machine comes into your running sheds, the manager sends a telephone call into another department, and four girls, armed with paraffin pots, bristle brushes, selvyts, and metal polish, enter, assault the travel-stained jigger, and leave it resplendent in twenty minutes or so. Your customer has to tackle this job for himself, and as he gouges congealed filth out of the chinks and crannies of your intricate advertising crank cases, and dives in and out of the numerous plated interstices of the rear wheel or the counter-shaft bracket, his curses of motor cycle engineers are deep and loud. Is there any real reason why the whole of the lower half of your engines, up to, say, the foot of the valve guides, should not be as smooth and polishable as fine marble? What genuine excuse is there for embossed crank case letters, protruding valve lifter details, naked tappets, and valve springs? Nowadays the average counter-shaft gear box, with its kick-starter racks and so forth, is beginning to provide another harbourage for indescribable accumulations of tough and glutinous dirt. Your back wheels have always been the limit in this respect, and the three-speed hub has trebled the number of plated dirt traps which always mustered there. Have you ever pictured the ideal of a stove enamelled artillery wheel, of the drop-out type, minus drawbolts, gear rods, chain cases, and the like? We loathe cleaning our machines; we want a motor cycle which can be drenched clean by a powerful hose in five minutes, and dried bright in another five; and you consistently ignore our pathetic appeal.

Bearing Wear.

You may further have noticed that you still get quite as many engines as ever returned to the factory for rebushing within their first season. You know what men would say if a car required new big end brasses inside three months. As you pile up engine efficiency you must either improve your lubrication systems or increase the size of your bearings. In this dilemma, few of you have done more than attempt to lead a little oil by gravity direct to the more heavily stressed bearings; and some of you go so far as to admit that there are better lubrication systems on the market than you employ, but that they cost too much. We would ask



Colonial model of the 8 h.p. Rex-Jap, showing new gear box, kick-starter pedal, and gate change lever. This mount has 28in. × 3in. tyres.

An Open Letter to the Trade.—

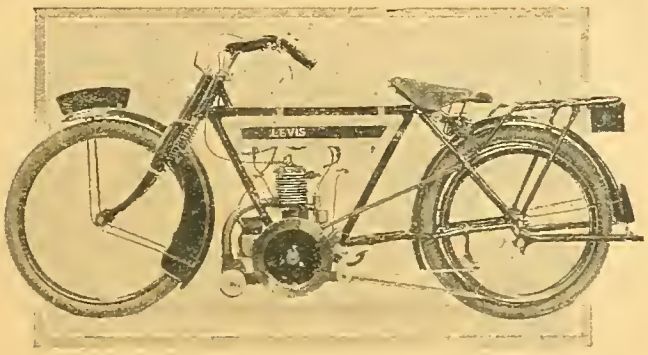
whether it is not true that a mechanical oiling system need not cost more than the crude systems of 1900? The situation is that engine efficiency is advancing by leaps and bounds; bearing design and dimensions are almost stationary; and lubrication design is all but stagnant. If you realise this, we are sure you will act.

Last season has seen the general adoption of the two-step drive, and a growing tendency to transfer the gears to the centre of the machine. Both tendencies are beyond question sound. But in the process the drive has lost something of its old sweetness, and this ground should be regained as rapidly as possible, alike in the interests of rider's comfort and engine durability. Please attend to a few members who fit appallingly ugly or troublesome chain cases. Some of your clients think that the chain-cum-belt drive is preferable on all grounds—reliability, simplicity, smoothness, and appearance. Those of you who prefer the two-chain drive on technical grounds must be careful not to handicap it by practical carelessness or stupidities.

Your old love of plating continues—whether there is a drop of blood from the gorgeous East in your constitutions, or whether you mostly hold shares in plating works, we cannot guess; but we tell you frankly that we hate the sight of a six month old machine, all dropping and dull after one night in a cold stable; and the less nickel there is about our 1915 mounts, the better we shall all be pleased. We admit there is a phase in the evolution of a motor cyclist at which he spends hours with selvyt and metal polish; but it is a brief and pitiable phase—please ignore it.

Sidecars and Cycle Cars.

In passenger machines we notice that you continue to lavish the wealth of your ability on the sidecar outfit de luxe, and regard it as a selling proposition at prices up to £120. You are doubtless justified in supplying a real market, but you cannot believe that a vehicle which exposes the driver so ruthlessly, which affords him so little insulation, and which costs as much as a good second-hand light car, has a tremendous future Cannot you do something with cycle cars inside this price limit? If you cannot, this department of your business will soon be hard hit by the second-hand light cars. We hinted there was too much of the engineer about your bicycles; may we now hint that the average heavy sidecar chassis needs a little engineer: serious fractures are too common in real hard work. Most of us believe that the moderate-powered sidecar outfit will be the one of the future, for it is economical, will go anywhere, and bring you home again in comfort, but we would like to see more attention paid to its design—that is the whole vehicle designed from the first with the knowledge that it is going to be a sidecar machine.



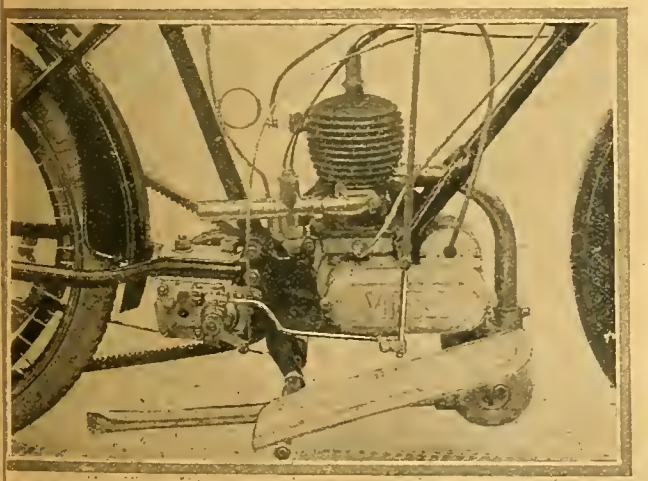
Flywheel side of the direct drive 1915 model 2¼ h.p. Levis.

In the lightweight class, some of your leaders appear to ignore the main opportunity. We have tried your £40 130 lb. lightweights, and very charming they are. We have also tried the £25-£30 100 lb. machines made by more daring concerns, and we see clearly that these need very little improvement to rank as equal to your best successes in other fields. Lightness is a great factor, but cheapness will sell two machines for every one that lightness can sell.

Electric Lighting.

We suppose electricity is bound to win in the field of lighting, and we quite think it will be very fairly reliable from the start. In the meantime, please do not overlook the claims of compressed acetylene. In any case, it is likely to be the cheaper of the two alternatives, alike in first cost and in upkeep, and it must always remain the more reliable. These are points not to be dismissed without a hearing. Imagine that you are a novice; then compare the handbook provided for a dynamo with the simple turn-on valve of a cylinder of acetylene. Picture methods of stowing away this cylinder on a bicycle frame modified for the purpose, and reckon out the reduction in costs which would be possible if these cylinders were pushed as they are pushed in the States. Finally, remember that electricity is only gaining ground in the States because exchange depots are separated by such enormous distances, and that here you could have one in every village, if necessary.

In conclusion, *Salaam!* Here's a quick end to the war, a boom in motor cycling, a safe return with V.C.'s to the despatch riders, and a fine summer to herald the return of peace!

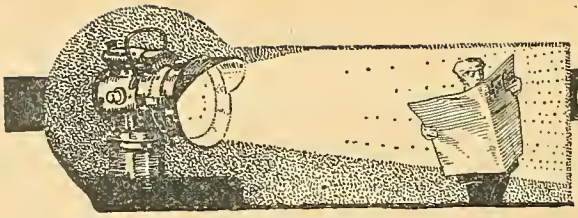


Carburetter side of the 2¼ h.p. Vitesse two-stroke engine fitted to a Sun.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints half-plate, 1/6 post free; mounted, 1/9 post free This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department Iliffe and Sons Limited 20, Tudor Street London, E.C.



Occasional Comments

"By Ixion"

Rather a Surprise!

When I disposed of my last machine I thought to economise by taking off the speedometer, and ordering new fittings to attach it to my next mount. Everybody knows that accessories add very little to the price a second-hand machine will fetch. The economy was hardly as large as I expected. The new machine, being of a different make, demanded two new gear wheels, new gear box, bracket, and driving shaft, for which the total retail price amounted to a couple of sovereigns.

Spring Clip Chain Links.

I was rather surprised to see a recent correspondent denouncing spring clip chain links on the ground that they are apt to come adrift and disjoint the chain. Often as I have one of the old joints (made with a bolt and nut) part company, I have never had a spring clip link fail when once put in position. My sole criticism of the spring clip is that it is a very easy matter to open the split end too widely and smash the clip, for which reason I always see that I have three or four spare springs before essaying a long trip on a chain driver.

Knee Grips.

Will those designers who retain the tank lever control of the ignition kindly make a note to shift the lever so far forward that it will not prevent the fitting of a pair of knee grips? My present machine has a spark lever boss so protuberant and so far back that these fitments are impossible. During last summer I have been riding with a pair of Waigh knee grips, which consist of leather pads, housing a tin box, wrapped in a duster. They are quite as comfortable as the older patterns, and supplement the pannier bags very conveniently on tour, as their tins are just big enough to house the extra touring outfit which cannot be packed into the carrier bags.

Tendencies in Tank Contours.

What do the public think of the new tanks? Until comparatively recent days, all our tanks were practically rectangular oblongs. Then the desire for large fuel capacity, combined with ultra low saddle positions, resulted in curving the tail of the top tube of the frame downwards, with a slight loss of frame strength (doubtless compensated for by an increase of gauge) and a slight gain in handsomeness. At the present moment tank shapes are growing a trifle chaotic. A common 1915 type is deep in front and shallow astern, wide in front and narrow astern. It is the result of the attempts to obtain a cheap, strong frame, in combination with a low saddle position and high fuel capacity, but it certainly looks appallingly ugly to my conventional eye. I wonder whether I am really conventional—for I always regard the extremely original Scott make-up as one of the very best looking on the road.

Rubber Gloves.

Not long ago I wrote perhaps a little slightingly of rubber gloves, because they are rather costly in proportion to their somewhat brief life. They may cost from 10s. to 15s per pair, and they are easily torn, whilst they are rather apt to perish unless the owner is careful to preserve them from frequent contact with oil. Nevertheless, they deserve to be ranked as the best rough-weather glove. Asbestol gloves are almost equally waterproof, but are inconveniently stiff. Rubber gloves are not only genuinely waterproof, but owing to the fact that they are practically innocent of ventilation, are also extremely warm. Thus they give us two very desirable and excellent features for winter use.

Speed and Gearing of Baby Two-strokes.

One or two letters recently to hand enquire whether two-speed gears are really essential with baby two-strokes and what hill-climbing powers and average speed can be relied upon. The enquirers remark that the cheapness and exceedingly light weight of single-geared models would induce them to buy samples as tenders to their heavy touring machines; but that they do not care to pay nearly £40 for a comparatively slow machine to be used for all purposes, including touring. If a baby two-stroke is single-geared, the gear ratio cannot well be higher than 6 to 1. On this gear a good machine *may* be capable of 40 m.p.h., but, owing to the low gear, there will be some fuss and vibration when 30 m.p.h. is exceeded, and few riders would habitually drive one faster than 30 m.p.h. on the flat. As all grades are bound to slow such a tiny engine, the highest touring average, non-stop, in ordinary country can hardly exceed 22 m.p.h., and it will not be easy to maintain a legal limit average during a day's touring. In respect of hill-climbing, the machine will romp up grades up to 1 in 9, even if of considerable length; but a hill of stiffer gradient will usually puzzle it. Dashwood and the Fish at Broadway represent quite the limit of its achievement in ordinary hands; Birdlip would be a somewhat speculative proposition. The more refined and costly machine, equipped with a variable gear, will climb anything, and will maintain a faster average speed in easy country. In difficult country it will not be faster than the single-geared types, because its top gear is higher, and, if it is faster on the flat, it is slower uphill. In other words, the two-speeder is desirable on long cross-country journeys and for regular use in the more mountainous counties; but the single-geared models are absolutely efficient for ordinary use. I think all tiny machines appear at their very worst in flat, dull country, as they are not fast enough for rides on which there is nothing of interest to hold the attention of the rider, and his sole desire is to reach his destination as fast as possible. Neither type is capable of a high average speed without a good deal of forcing.

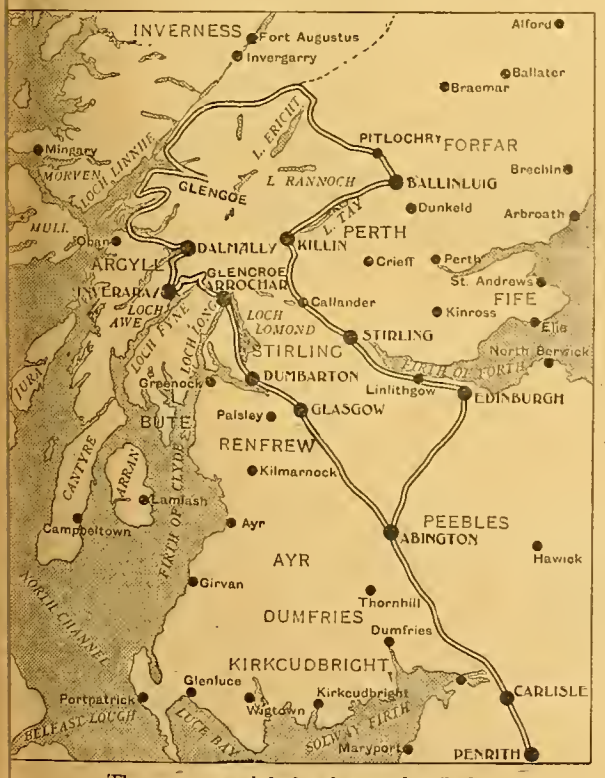
AUTUMN 'MIDST SCOTTISH CRAGS

AN IDEAL ROUTE THROUGH THE HIGHLANDS

By GEORGE D. ABRAHAM,
Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc., etc.

A typical scene on the shady shores of Loch Tay where the road in the lower reaches skirts close by the water.

THE ancient slogan of the Campbells, "'Tis a far cry to Loch Awe!" has nowadays lost much of its meaning. The mountains, which in earlier times cut off the great "lonely loch of the Isles" from civilisation, are crossed by roads which afford easy passage to the motor cyclist, or other enthusiast of the modern means of locomotion. But even yet the long, winding, but wonderfully beautiful road up by the western lochs is very little known, and this fact led us to choose it as a route up north into the wildest recesses of the Highlands. A fully and heavily equipped 1914 Clyno was the machine chosen for the expedition. Its aid and behaviour made us agree that nothing can beat a motoring and mountaineering holiday in the Highlands.



The route covered during the tour described.

Over the long, wind-swept wilds of Beattock we had come north to Glasgow, with its wearisome sixteen miles of suburban traffic putting the finishing touch on a long day's run. Next morning almost similar conditions prevailed on the north side of the city, and there was little relief from trams, and crowds of young Scots who made the streets their playground. But once beyond the stately frontage of the Argyll works at Alexandria, the scene changed suddenly. The road darted out of city smokiness into sunny, oaken avenues all tinged with the gold of autumn. Purple mountains gleamed ahead through the leafy screen, and a final glide down another glade brought us quickly out to the open shoreline of Loch Lomond. The contrast with the workaday world only a few miles behind was remarkable. The old Ben which takes his name from the loch was mirrored on the still surface, and the slow movement of the fleecy cloud which capped his breezy head was the only sign of life or movement in the land of mountain peace; all purple and grey and golden, it was a scene typical of many succeeding days.

Road Repairs.

With the road close neighbouring the calm water there came fresh beauties at every turn but one. At this point extensive road repairs made their presence felt unpleasantly. Masses of sharp, broken fragments of the adjacent mountain side covered the roadway, and former experiences led us to dismount and push our heavily laden vehicle over this stretch. This and the sight of our bulky climbing boots amused the native workmen vastly. My remonstrances regarding the repair methods employed brought forth the suggestion from the "canny Hielander" on the steam roller,

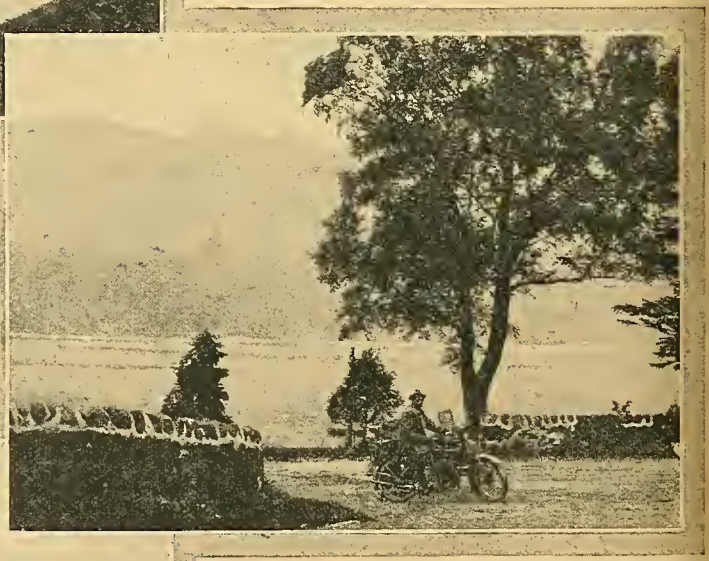
Autumn 'midst Scottish Crags.—

"Hoch! me lad," he said with a glance at my feet, "just thee walk aboot a bittock an' the road'll be aw reet."

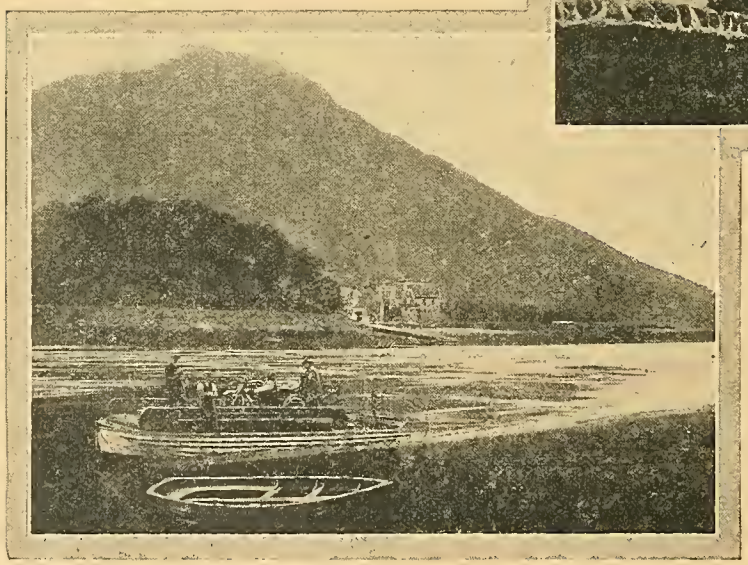
However, towards Tarbert matters improved, and soon we were swinging down the long hill to the sea-level at Arrochar, near the head of Loch Long. The

Amongst the great mountains of Glencoe. The central peak is a buttress of Bidean nan Bian, the loftiest peak in Argyllshire. The little loch on the left is that of Triochatan.

weirdly-shaped peaks of the Cobbler looked down on the once secluded valley which now echoes with busy life. A great torpedo-testing depot recalled thoughts of the far-distant world of strife, and the cheerful soldiers who guarded the lonely road seemed almost to hail us as deliverers from their dull vigil. Prophecies that our unkempt appearance would lead to trouble were not justified, and soon we were away again, whirring up into the wilds of Glencroe. The Cobbler still peeped superciliously down upon us with his nose in the air, and at his feet the well-known gradients leading up to one of the most famous of Scottish hill-climbs. A grey line curled up the mountain façade ahead, and the signpost told us it was the "Rest and be Thankful Hill—ascent 461 feet in 2,161 yards." But our mount made light of the climb—in fact, the ascent was almost made on second gear, the lower gear only being needed on the final corner, and that as a matter of safety on the slippery cobbles which have been used to pave the turn. As it was, the speed of our approach flung us crab-wise across the slippery turn, and the excitement of this caused us to forget to halt and test the merits of the famous Rest and be



Near the head of Loch Long, at Arrochar, with the peaks of the Cobbler in the distance.



On the Northern side of Ballachulish Ferry, with Ballachulish Hotel at the foot of Sgurr Dhonuil. An excellent motor boat now makes the crossing safe and inexpensive.

Thankful Stone which Wordsworth has immortalised. The comforts of the sidecar induced the same feeling during the descent by gloomy, treeless Loch Restil and Glen Kinglas to the foliaged shores of Loch Fyne, where Scotland's most famous fish comes from. One encounters more of the homely haddock than the sporting salmon in the Highlands.

Rabbits and Grouse.

Then around the winding shoreline we hurried to Inveraray, with Scotch mist altogether enfolding the distant landscape. The celebrated castle was noticed, but before entering the town there came a sharp turn to the right under a curious granite arch, and

Autumn 'midst Scottish Crags.—

the way led mountainwards once more. Up through the most wonderful woods, whose shades recalled thoughts of the Dolomite Forests, we mounted to the brackened heights, where Highland cattle gazed dreamily under their fringed eyebrows. Rabbits darted swiftly in front, each showing a white danger signal to its mate as our forceful Clyno seemed to revel in the speed rush up to the heights. A covey of grouse almost misjudged our approach. One of these only escaped by the skin of its "tee-al fitthers," as the genial keeper said, who shortly answered our question as to road divergence. The roughness of the long descent to Loch Awe

A scene at the head of Loch Creran, with the Ben rising in the distance. The loch is scarcely more than a mile across, but one has to travel eight or nine miles inland to gain the road so temptingly seen on the other side.

precluded quick travelling, and there was full time to enjoy the glorious scenery ere the road dipped down to the tree-hung shoreline. "Up hill and down dale" brought us to Dalmally, where a sharp turn to the left led to the main, westerly-running road to Oban.

The Pass of Brander.

Hopes had been entertained of a better surface on this section, but these were soon is shattered as the once perfect highway. t was evident here as elsewhere, except on parts f the north trunk route, that Scotch road surfaces adly need conforming to modern traffic. When ome miles from Dalmally we felt the need of eeking out a comfortable resting place for the ight. One of those most useful signs erected by he Scottish Automobile Club, which locate native eatures of interest, proclaimed the approach to he Pass of Brander. A "misty, moisty twilight" poilt the scene, but now and again on the left big nountains loomed across the still waters of Loch Awe. The road, with great tree-hung crags overhead, cut along a narrow shelf almost overhanging the gloomy depths, and one sudden skid induced by the attack of a sheep dog very nearly inclined the Clyno to break still another record, this time in the way of a high dive.

Farther on, the "narrows" widened out, and through the Pass of Awe, a wild spot whose name acquired force by memories of savage deeds by Bruce and Wallace, we came to rest at Taynuilt.

This latter place proved most suitable for climbing Ben Cruachan, and in due course we started westwards once more on a perfect morning. The plan was to reach Glencoe by the little-known coast route. Loch Etive, grandly mountain-tended, was revealed in cloudy beauty on the way to Connel Ferry. It was an exhilarating run over the lofty moors. Now we were up on some heathy height where shaggy Highland cattle kept guard, and ofttimes acted as natural speed limits ere there came the wild rushes down into the hollows, where grouse and pheasant fled to shelter. At Connel Ferry the outstanding feature was the unique bridge over the mouth of Loch Etive. Under the great span the tide roared and fumed against the downcoming water, the bore

A still day on the shore of Loch Linnhe. The Ardgour peaks are seen across the water.

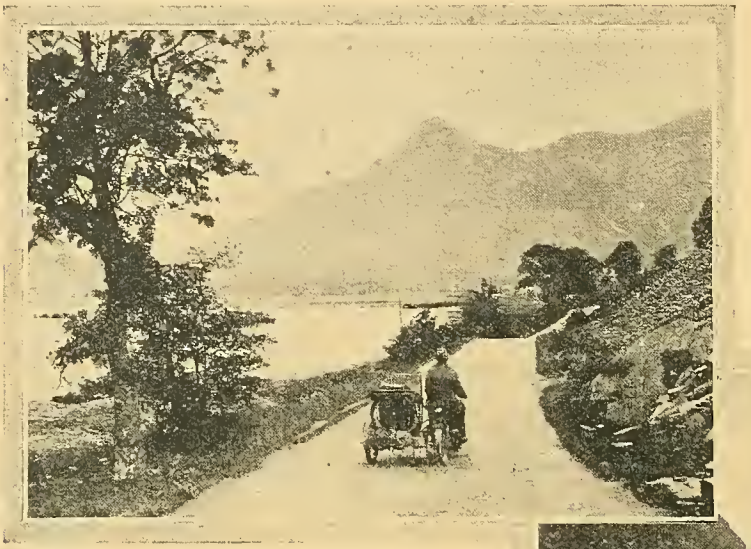
forming at the time of our visit the remarkable Falls of Lora.

An Expensive Ferry!

The once notoriously dangerous and famous ferry was fortunately found in a state of disuse. A dry old "Hieland salt" offered to "tak' us ower for fifty pun if we wad wait till t' sma' hours." Luckily it was found that the railway company have now made a road over the viaduct alongside the railway. This saved us a big sum on the former offer, though

Autumn 'midst Scottish Crags.—

5s. 4d. was paid for the crossing. Of the two tickets given us one was for the machine and the other for "one passenger and one dog." The identity of the latter remains unsettled. Incidentally it may be mentioned that this Connel Ferry Bridge road, which was only opened last June, will have a great effect on motor traffic in the Highlands. It opens out a magnificent northward route through the grandest scenery in Scotland. For driving a motor cycle or car across the bridge the tariff is 2s. 6d. and 15s. respectively. Doubtless many will be tariff reformers in this district.

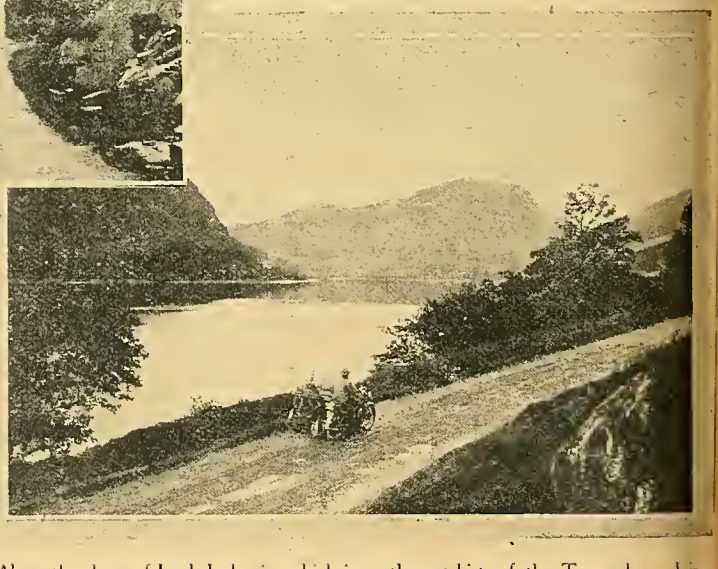


On the shore of Loch Leven, with the Gap of Glencoe rising ahead. This well-known mountain sentinel guards the entrance to the famous pass.

Once across the bridge, with its unique view of troubled waters below and blue peaks encircling all afar, it was found of some importance to take the left-hand turn Then we were soon cheered by the sight of the long open "straights" over the mosses by Benderloch to Loch Creran At the entrance to what seemed to be a richly-wooded private park the driver halted, expecting toll of some kind. "No need ever to stop unasked to offer payment in Scotland" was the curt advice, and ere long we were threading miles of beautifully wooded glen where dense gloom reigned in the silent depths. The surface became decidedly rough round the head of Loch Creran, but the slow pace thus needed allowed full time to appreciate the grandeur of the scenery. The driver had more thought for his tyres, but the Avons came scathless, as usual, through miles of stony ordeal. Once round the head waters of the loch the surface improved, and soon came the cut across country to Appin and the bracing descent to the shores of Loch Leven, with the shapely peaks of Ardgour on its farther shore. A shower chased us along to Ballachulish, and thence up into the purple shadows of great mountains that form the portals of gloomy Glencoe.

Famous in History.

To the climber, Glencoe is the most fascinating spot in Scotland, and from the little inn at Clachaig we made many sallies on the surrounding peaks. Most were so close at hand that one almost stepped out of bed on to the crags. The scene of the historic massacre was visited, with the great cone of Bidean nan Bian, the loftiest peak in Argyllshire, towering overhead. The Three Sisters, which form such a magnificent granite phalanx on the southerly wall of Glencoe, are merely the offshoots of the Bidean. The terrific hole high up on the front of the nearest "sister" to Clachaig is known familiarly to the tourist as Ossian's Cave. The climb up into this was a long and difficult problem. The Clyno proved a useful friend in reaching the peak of Buchaille Etive, over eight miles away and above the easterly end of Glencoe. A day of wind and storm made the expedition exciting throughout, and the Clyno's ascent in a gale up the rugged zigzags of the Pass to the "Study" was an event to remember. But the descent that same evening after almost becoming benighted on the crags above was even more memorable. In dense darkness and driving mist we felt our way literally down into the abyss on the lower gears, the Clyno straining and jumping as though anxious to get away on the easier lower gradients At one point the high gear was tried—but only once



Along the shore of Loch Lubnaig, which is on the outskirts of the Trossachs and is still open to motorists. A shoulder of Ben Ledi rises on the left.

A few days later we took the journey to Fort William, crossing the celebrated ferry at Ballachulish on the way. An efficient motor provided the power The arrangements at this once dangerous and expensive place were excellent. The amount paid for the crossing was 4s., instead of the £2 charged about two years ago. In those days a car was charged £4, now it is only 15s., whilst 2s. is the fee for a motor bicycle No one should grumble at these new charges, for to avoid them a round of over 150 miles is necessary in order to reach Fort William and the North. W

Autumn 'midst Scottish Crags.—

learnt the good news that during the coming winter a road will be made round the head of Loch Leven, the survey already having been finished. At Fort William we found the Palace Hotel the most comfortable abode encountered during the whole tour, and this tempted us to spend much time in the neighbourhood and on Ben Nevis. The run up Glen Nevis and also round the shores of Loch Eil should be taken by all who visit the district.

A Cold Bath en Route.

A morning of heavy rain greeted us on the occasion of departure for the south. The driver refused his usual cold bath, saying that he would take it later on in the saddle. He did. In some respects it seemed unsatisfactory for the writer to be comfortably tucked away in the sidecar, all sheltered from the downpour by hood and screen. Some day these machines may probably be provided with some well-deserved shelter for the driver. Our route lay up over the wild moors to Loch Laggan, all mist wreathed and wild in the autumn storm. Near the end of the long lake the rain ceased, and, avoiding the main road run to Kingussie which everybody advised, we risked the short cut over the moors to Dalwhinnie This was a notable success. It saved twenty miles of running, and the road was almost superior to the trunk route. A height of over 1,200 feet was gained almost imperceptibly, and the long downward swoop was enlivened by continuous encounters with packs of grouse.

Near Dalwhinnie the Great North Road was joined, and soon we were speeding over the crest of Drumochter Pass (1,500ft.), where the Highland Railway close alongside reaches the highest point of any railway in Britain. It was a bracing downhill run for miles until the wild, bare moors were far behind and the wooded lower depths of Glen Garry gave shelter from the keen mountain breezes. Then through the historic Pass of Killiecrankie, where graceful silver birches, now in full golden splendour, added to the indescribable beauties of the glen, we came to Pitlochry. In gathering twilight the trunk road was left at Ballinluig, and ere Aberfeldy was reached as resting place, the twisting, tree-shaded road had brought the average speed down unpleasantly.

Next day we set forth for the Trossachs along the shores of Loch Tay, through Killin and down Glen Ogle, passing Lochearnhead on the way. Unfortunately, we found that romantic and beautiful district, with Loch Katrine the queen of all, closed to motors entirely. The beauties of Loch Lubnaig on an evening of wondrous stillness somewhat atoned for the disappointment. Next day we left the Highlands at Callander, and through familiar Stirling and Edinburgh sped southwards with memories of the grandest sights of mountain, woodland, and loch that Britain can show.

Our sidecar outfit had carried us faithfully for more than 700 miles over roads that many a machine would have resented. A strong luggage grid fixed behind the sidecar proved indispensable, the more so as thereon was fitted a special receptacle for a spare tin of petrol. In the remoter districts motor spirit was almost unobtainable. The D.A. cylinder was excellent, it made us independent of daylight on the worst mountain roads. Thanks very probably to the large size of the Avon tyres the use of the special spare wheel equipment on the Clyno machine was never required until the night approach to Carlisle on the return journey. Considering the darkness and dampness of the night it proved a true friend indeed during the one and only attack of the puncture fiend.

Training Military Motor Cyclists.

For Co-operation with the Armoured Car Service of the Royal Navy.

AS will have been gathered from paragraphs published in recent issues of *The Motor Cycle*, Sub-Lieutenant Stocks—known in the motor car world as J. W. Stocks, of the De Dion Bouton Company—has been engaged in the formation of motor cycle squads for military work. He has already completed a squadron of over two hundred men for attachment to the Royal Naval Air Service, and now he is engaged in getting together three hundred men to drive Scott motor cycles fitted with sidecars, mounted upon which are quick-firing guns.

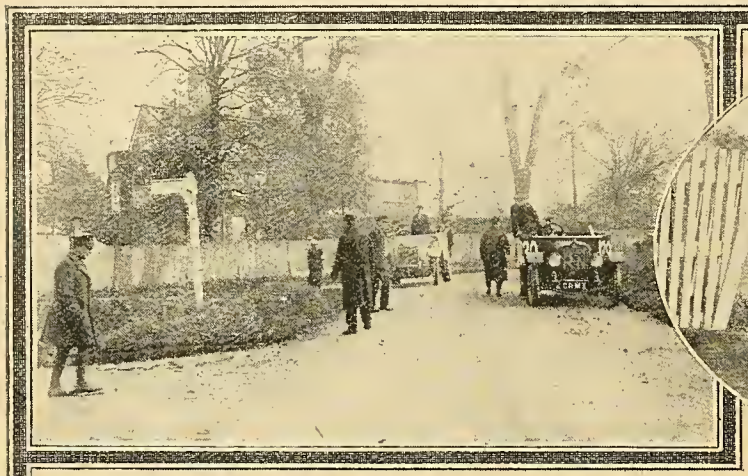
After having proved their ability in the handling of a motor cycle and sidecar and been accepted for service, the men undergo a military test, so that when they arrive on the Continent and undertake the real work they will not be "working in the dark." The illustrations on the next page show the raw motor cyclist in course of transformation into an efficient military motor cyclist. As they are to operate in connection with the armoured cars' aeroplane support of the Royal Naval Air Service, several armoured cars are taken on the road at the same time. Thus the crews and cars are tested and trained with the motor cyclists with whom they will have to co-operate. Incidentally, it may be mentioned that for armoured car work high-powered touring car chassis of established make are being used.

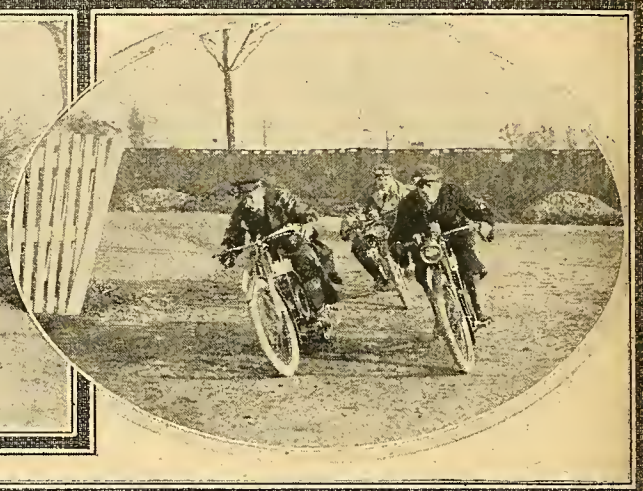
An important part of the military test is the reconnaissance work and subsequent reports of the state of the road, and the illustrations show various phases such as map reading, preceding the armoured cars, hiding machine and oneself in an exposed village street. In this way the men learn quite a lot of things that they must not do under certain conditions. For instance, it is interesting to observe how the man lying behind the heap of stones in one of the pictures would be able to shoot the two riders coming round the corner abreast before they had seen him. However, abroad these two men will be on their guard, and, if similar circumstances arise, one can imagine them drawing lots to decide who shall go first!

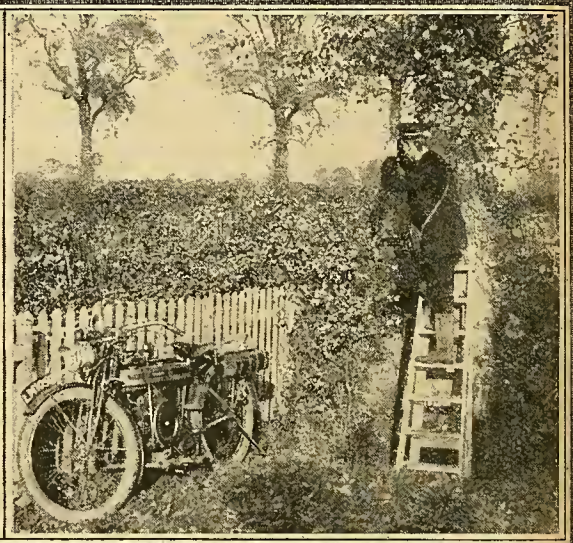
It is difficult to imagine work that would appeal more to the keen motor cyclist desirous of serving his country than that for which these men are training. Of course, the risk run is considerable, and there is a certain amount of roughing it, but that is all in the day's work; one is doing one's bit for the country and thoroughly enjoying oneself at the same time.

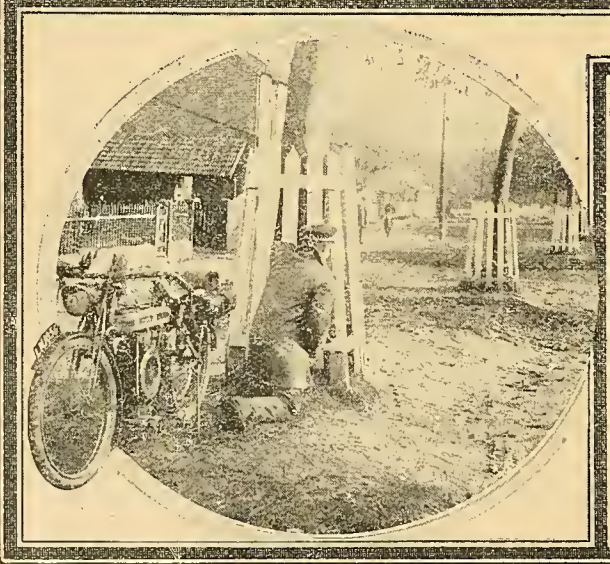
TRAINING MOTOR CYCLISTS FOR WORK IN CONJUNCTION WITH ARMOURED CARS.

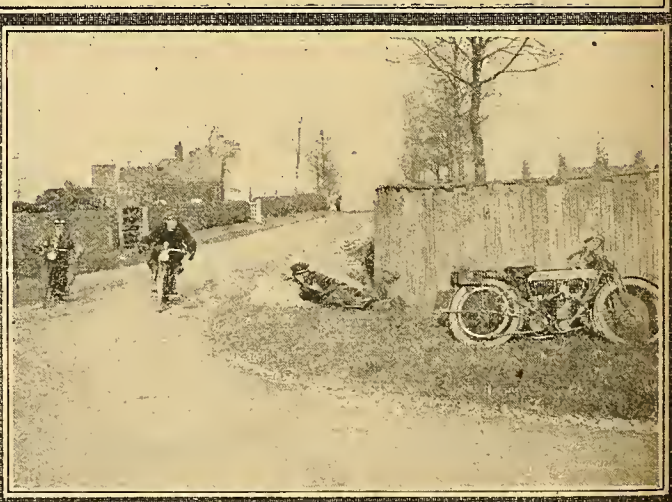
(See article on previous page)









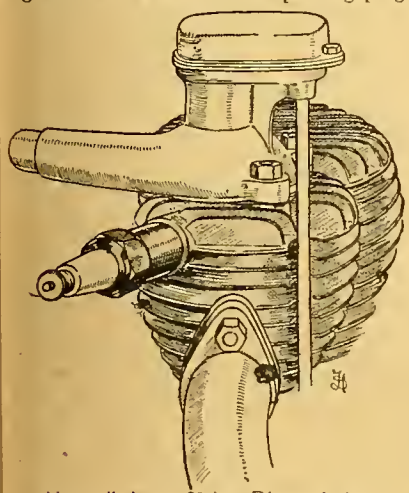


1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

A NEW SPORTING DIAMOND.

A MACHINE which embodies many interesting features, all of which are mechanically excellent, is the new sporting model Diamond manufactured by Dorsett, Ford and Mee, of Sedgley Street, Wolverhampton. Our readers will recall that the salient features of the Diamond machine are the extremely large valves (the inlet being overhead), the unusual double bevel two-speed gear, and the sloping top tube. All these features are retained, but modifications have been made in a few places. The sporting type has a somewhat altered cylinder, vertical ribs being cast at an angle across the head. The sparking plug



New cylinder on 2¾ h.p Diamond, showing the enclosed overhead valve mechanism, new plug position, and additional radiating fins.

is now placed horizontally in the side of the valve chamber, and the inlet pipe is curved away so as to be well clear of the frame, and to allow easy access to the valve. The bore and stroke of the engine are 75 × 79 mm. Both inlet and exhaust valves provide a clear port of 1⅜in. diameter.

Engine and Frame Modifications.

The only other alteration to the engine is a somewhat improved crank pin fixing, and the gear remains as before. The latter is particularly simple in action, as by the removal of a single cover plate it is possible to examine both gears, the clutch, camshaft, and magneto drive.

The frame is slightly altered, the pronounced slope to the top tube having been modified, and though the straight tube still remains, the actual seat-pillar lug is cast with a slight curve in it, consequently, the effect of dropped tube is obtained without any bends being formed in the actual tube. It will be remembered that the Diamond was one of the very earliest machines to be fitted with all straight tubes and a sloping top rail.

The sporting model has no kick starter. It is fitted with a long silencer pipe, with a small expansion chamber close to the rear end.

The standard model will in future be fitted with somewhat wider guards and a hinged footrest, which leaves plenty of room for the kick starter pedal.

Commendable Kick Starter Design.

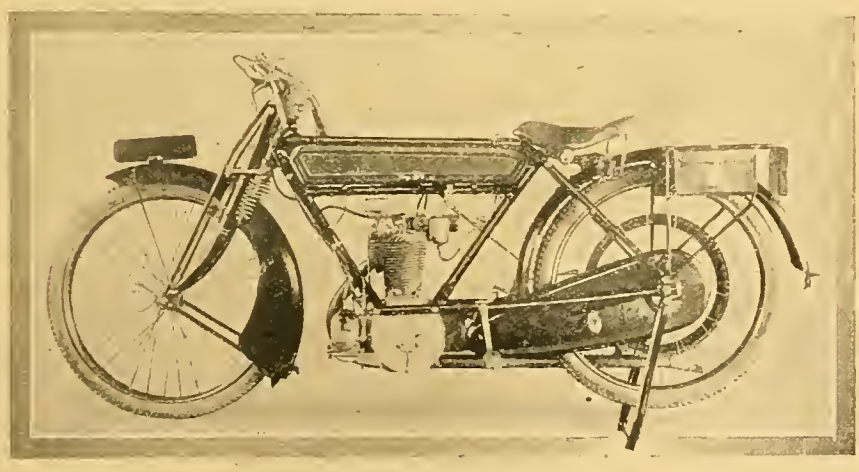
The kick starter itself is worthy of attention, as it acts direct on the crankshaft through one pair of gear wheels only, consequently there is no intermediate transmission to cause stiffness. The clutch remains as before, consisting as it does, of a double metal cone running in oil. The fittings throughout are excellent, and include drip feed lubricator, a pan seat, and a stout stand and carrier.

From a short run on one of the sporting models we may safely say that we have seldom ridden a machine of the same capacity which has more life than the Diamond. It might be thought that the bevel and chain drive would produce considerable noise, but this is not the case, and the gearing was almost equally quiet on both low and high gear. The riding position is comfortable and the speed is surprising; from which it will be gathered that our impressions were favourable.

EDITORIAL NOTE.

IN the following pages we illustrate and describe a number of 1915 model motor cycles. Already many full descriptions of other 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions appeared:

Sept. 3rd.	Henderson and Levis Popular.
„ 24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct. 1st and also 29th.	Three-speed shaft-driven Rex.
„ 8th.	Radco and Abingdon.
„ 15th.	Ivy, Vindec, and 4 h.p. Brown.
„ 29th.	Calthorpe, Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and Two-stroke Ariel.
Nov. 5th.	Sparkbrook, Lady's, Metro, 2¾ h.p. and 6 h.p. Enfields, Omega and 4 h.p. A.J.S.
„ 12th.	6 h.p. Humber, Sun-Vitesse, and Levis.

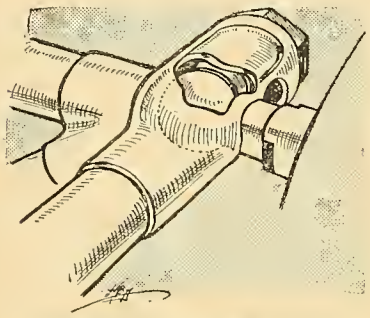


1915 model T.T. pattern Diamond

THE 7 h.p. MATCHLESS SIDECAR.

Improved Design Sidecar Chassis, embodying a Spring Wheel.

THROUGHOUT the year 1914 Messrs. Collier and Sons have been very successful with their Matchless sidecar combination. The 7 h.p. sidecar machine is a thoroughly well-designed and practical vehicle, which has stood a year's testing with the greatest success, and has undergone even further improvement for next year.



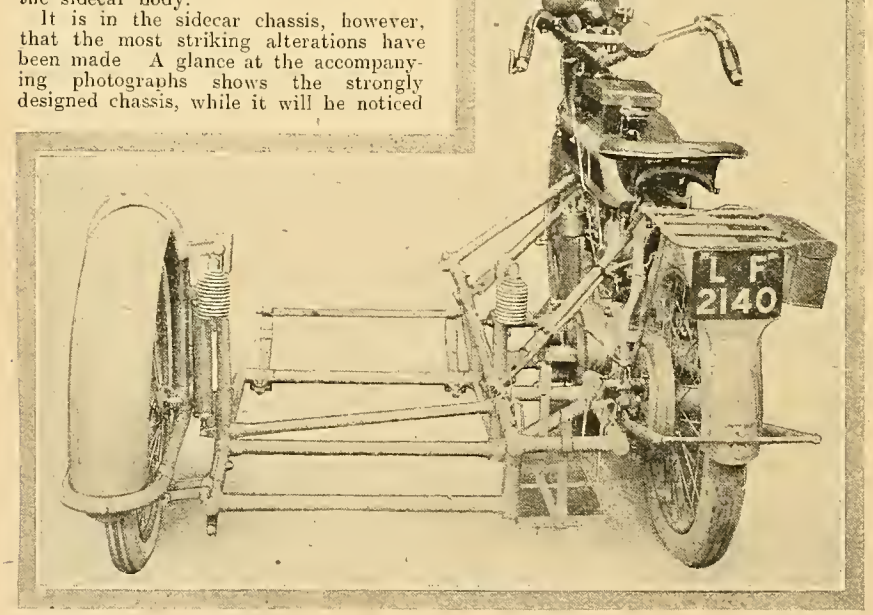
Matchless sidecar ball joint attachment to back fork.

In the machine itself little has been done, as practically no alterations were necessary. Its chief points are the silent chain drive from engine to countershaft and the practical three-speed (sliding type) gear box. The chief alteration, however, on the new model has been the introduction of detachable wheels, brought about by using a hollow spindle and the provision of dogs for coupling the wheel to the driving mechanism. All three wheels of the combination are therefore detachable and interchangeable. The spare wheel is arranged to be carried in the back of the sidecar body.

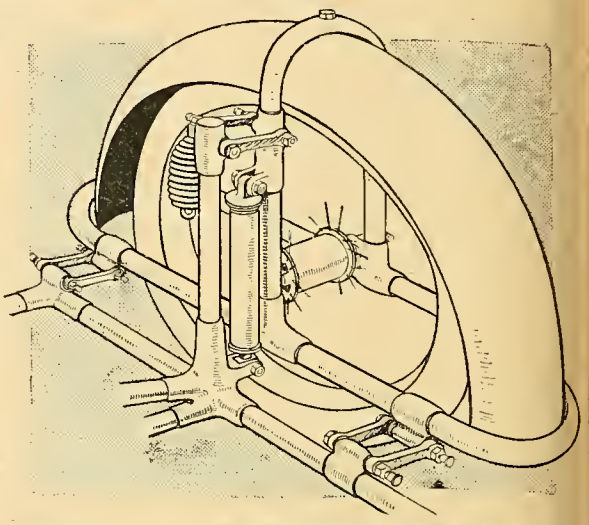
It is in the sidecar chassis, however, that the most striking alterations have been made A glance at the accompanying photographs shows the strongly designed chassis, while it will be noticed that an ingenious form of spring wheel has been introduced, the working of which is shown in detail in the line drawing. The wheel is self-contained in its own forks, and is attached to the rest of the chassis by means of three long links. Its movement, however, is restricted by means of an enclosed coil spring, which may be clearly seen in the illustration. The combination has been photographed without the body, so as to show the method of springing and also the neat coil springs upon which the body is supported.

An interesting feature is the ball joint coupling the chassis to the back forks of the motor bicycle, the object of which is to ensure perfect alignment and the minimum amount of strain between motor cycle and sidecar. Another interesting point is the provision of a framework for carrying a spare petrol can. This outfit may be fitted with the excellent Lucas lighting installation, which we described in detail in our issue of October 22nd.

Another new model for 1915 will be the 4 h.p. three-speed solo touring machine, which, however, at the time of writing is not actually on the market.



The new spring wheel Matchless sidecar chassis ; the spiral springs support the body



Sidecar spring wheel showing complete adjustment and links to frame. Note the grease cups to all the shackle spindles.

A TRIUMPH ANNOUNCEMENT.

WHEN Mr. M. J. Schulte, speaking at the annual general meeting of the Triumph Cycle Company, Limited, stated that the company was not resting on its laurels, but was pursuing a vigorous policy in improving the machines, chiefly the motor cycles, he gave the first public intimation that an entirely re-designed Triumph motor bicycle would appear for 1915. It has been common knowledge in inside circles that the Triumph Co. had designed a new engine, and that, moreover, after tests extending over a period of many years, had produced a three-speed countershaft gear which satisfied the firm's ideals, and embodying chain and belt drive.

The specification of the 1915 Triumph is given in our Buyers' Guide this week, from which it will be noted that the 4 h.p. engine is retained with a bore and stroke of 85×97 mm. The motor has a new design crank case, a new cylinder casting, re-designed timing gear with external cams and a new carburetter. More details cannot be divulged at present, as the final design will be ready shortly.

ADDITIONAL O.K. MODELS.

Messrs. Humphries and Dawes, Ltd., of Birmingham, the makers of the O.K. machines, announce that during next year the O.K. Junior—which has had such a run of successes this year—will be continued, though it has been improved in detail parts. There will also be a lady's model, and a second O.K. model of 2½ h.p. with side by side valves. The firm have recently erected large and well equipped new works, and in future O.K. machines will be British-built throughout.

IMPORTANT ANNOUNCEMENT.

STURMEY-ARCHER GEARS, LTD.,

BEG TO ANNOUNCE THAT THEY HAVE ACQUIRED THE BUSINESS OF THE

ARMSTRONG TRIPLEX 3-SPEED CO., LTD.

STURMEY-ARCHER 3-SPEED GEAR FOR CYCLES AND MOTOR CYCLES WILL HENCEFORTH BE SUPPLIED IN PLACE OF ARMSTRONG.

Repairs and Sundries for Armstrong Gears will be dealt with by the New Hudson Cycle Co., of Birmingham.

1915 Programme.

THE new Sturmey-Archer 3-speed countershaft gear, with enclosed kick-starter. Gears constantly in mesh. Light and neat. A revelation in countershaft gears. Suitable for 3 to 6 H.P. engines.

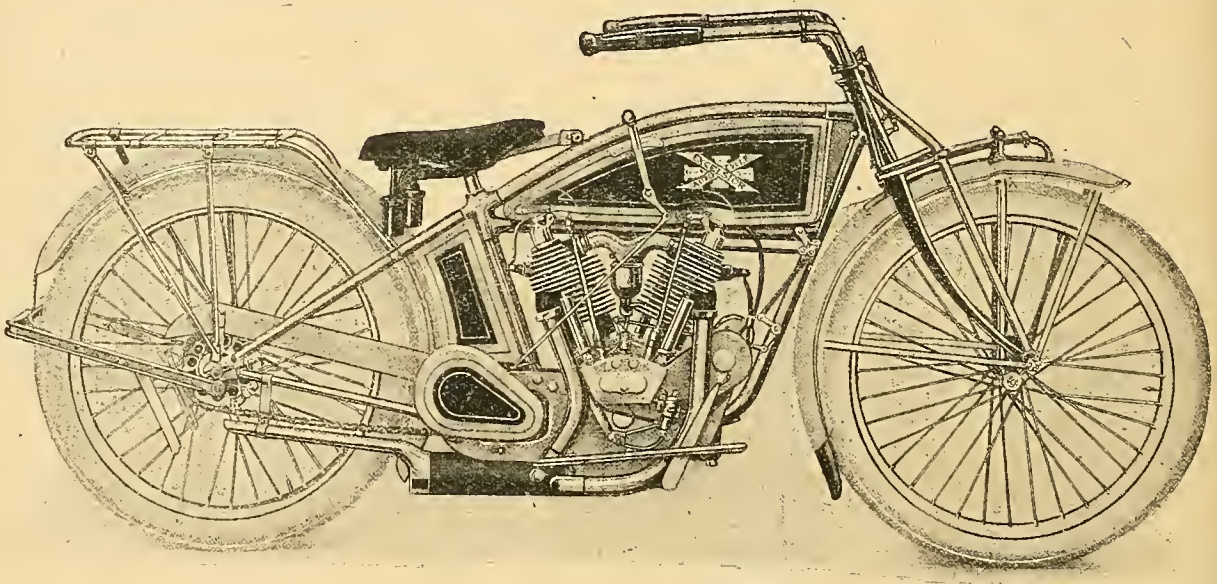
THE NEW

AMERICAN EXCELSIOR

THIS IS THE REASON WHY WE CAN MAKE THIS STARTLING OFFER.

7 H.P. 3-speed, Chain Drive, Kick Starter, £59



BRIEF SPECIFICATION.

ENGINE.—7 h.p. Twin (84 × 89).
LUBRICATION.—Mechanical and Hand Pump.
IGNITION.—Bosch.
VALVES.—Extra large.
STARTER.—Kick Starter with Folding Foot Lever.
CARBURETTER.—Schebler.
SPEED GEAR.—Sliding type.
CLUTCH.—Multiple Disc.
FRAME.—New style, very low saddle position.
CONTROL.—Throttle by right grip, Clutch by left grip, or left pedal. Magneto Lever on tank.
BRAKES.—External and Internal Bands.

DE LUXE MODEL, EXTRA £9, includes Splitdorf Combination Lighting and Ignition System, powerful Head and Tail Lamps, Electric Horn, and Speedometer.

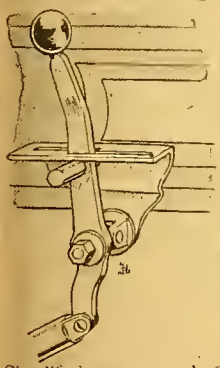
AN ENTIRELY NEW B.S.A. MODEL.

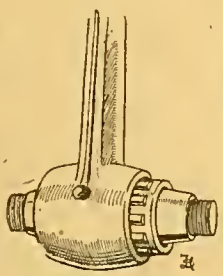
A 2¼ h.p. Four-stroke—Detail Alterations only to Present Machines—Caged Roller Bearings Adopted for Big End.

As the result of experience gained, the B.S.A. Co. have found it unnecessary to make any radical alterations to their present machines.

The 3½ h.p. engine is now only fitted to the T.T. model; the engine has undergone practically no changes, with the exception of the fitting of a roller bearing big end. This bearing is unusual, in that the rollers are mounted in a cage, and consequently are not allowed to touch each other, but bear only on the crank pin and the inner end of the hardened connecting rod. An interesting alteration has been carried out in the frame, for the head lug is curved slightly upwards. This construction, when properly carried out, is extremely strong and yet light. The addition of a long tail pipe for the exhaust completes the innovations in this type, which is, of course, still fitted with a B.S.A. carburetter and spring forks.



Simplified gate control of 2¼ h.p. B.S.A.



New caged roller bearing big end on 3½ and 4¼ h.p. B.S.A. machines.

Improvements to Existing Models.

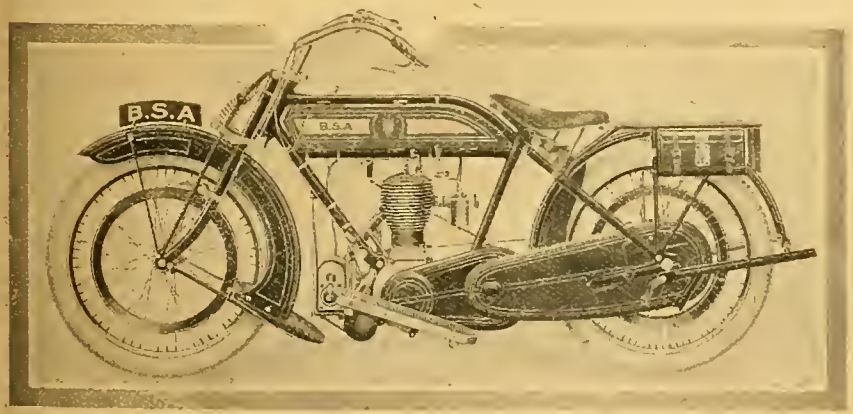
The three-speed countershaft geared models, fitted with big 4¼ h.p. engines, are particularly suitable for all types of sidecar work. The construction throughout is extremely solid, while the engine develops its full power at speeds which can be conveniently used on the road. The engine in practice is very flexible, and has a good turn of speed. In this engine, also, a roller bearing has been introduced in the big end. The tank has been enlarged to take 1¾ gallons of petrol. The front forks are made somewhat wider to accommodate a specially wide front guard. A refinement which will be fully appreciated by practical riders is that an internal V type brake has been fitted to the front wheel, operating on a dummy belt rim; this gives the necessary power, and yet permits the front wheel to be dropped out in case of tyre repair without disturbing any brake gear. The front forks have been altered slightly in detail, and the spring links are somewhat longer, but the general design remains the same.

The foregoing remarks apply to both the chain and belt-driven machines, and also to the all-chain model. This model is, of course, fitted with a B.S.A. spring shock absorber, which has proved eminently satisfactory, and absorbs all the harshness of the drive.

The B.S.A. Sidecar and Trade Carrier.

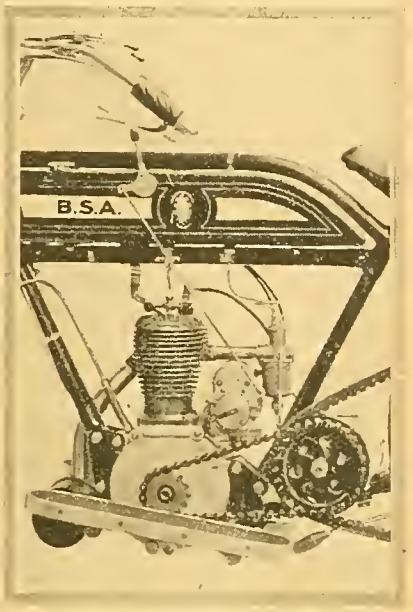
For use with these machines a neat sidecar is marketed The chassis and fixings are particularly strong, and the springing is very comfortable. It may be recalled that the rear portion of the B.S.A. sidecar is suspended on enclosed coil springs, which are connected to a rail carried high up behind the back of the sidecar. The only alterations to the sidecar chassis are a somewhat strengthened mudguard stay and the addition of a simple pivoted stand for the sidecar wheel.

A special tradesman's carrier will be put on the market for the first time. The sidecar chassis has been somewhat lengthened, and the box, which is very commodious, is carried on four short C springs. The machine we inspected was fitted with a neat electric lighting set, which can be supplied if specially ordered.



The new 4¼ h.p. chain-driven three-speed B.S.A

By far the most interesting B.S.A. innovation is the new 2¼ h.p. machine. The company are thorough believers in the future of the small machine, but favour a four-stroke engine. They have made no attempt to turn out an extremely light and cheap machine, but have rather designed and constructed a sound go-anywhere mount, which is to sell at a moderate price, and which will be fitted as completely as the larger models. It may be mentioned that at the present time there is no idea of putting the new machine on the market before the spring, and though the machine has successfully passed the experimental stage, the company are so busy on other work that there is little likelihood of the new model making a public appearance before that time.



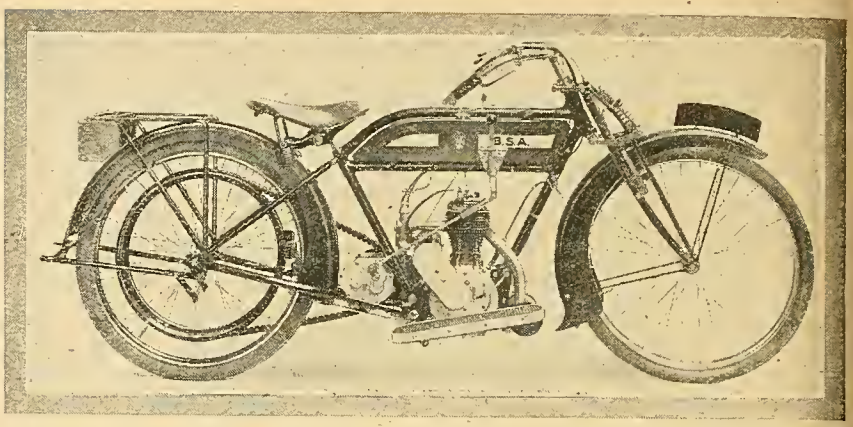
Power unit of the new B.S.A. production—a 2¼ h.p. four-stroke model with three-speed countershaft gear

The engine is a well-designed single cylinder of 68 mm. × 68 mm. which gives a cubic capacity of 247 c.c The designer has obviously had in view the important point of making an engine which shall be both cleanly in running and easy to clean, for there is an absolute minimum of external excrescences to act as mud traps.

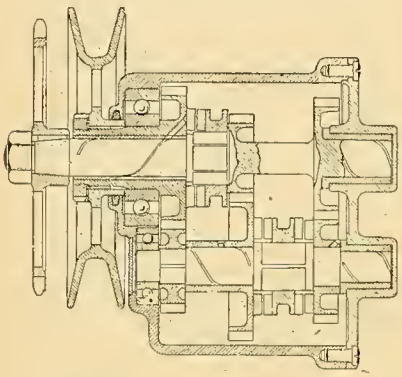
The valves are placed side by side, and besides being of good diameter the ports are well designed and allow a very easy passage for the gases. Both valves are operated by separate cams, which are mounted on a single camshaft, the rocker gear being extremely simple. The same shaft is used to drive the magneto, which is placed behind the engine in an accessible position and out of the way of mud. Both gudgeon pin and big end are extremely large; in fact, they are of the

An Entirely New B.S.A. Model.—

same dimensions as those used on the 3½ h.p. model. This is a point very often overlooked by designers of light machines, and small bearings are frequently fitted, with the result that wear soon becomes apparent, and the machine rattles and becomes noisy. The B.S.A. have guarded against this in every possible way. A ball bearing is fitted on the pulley side, and a very long, plain bearing on the timing gear side. Lubrication is by ordinary hand pump, oil being splashed in the usual way, but a special groove is formed in the timing gear side flywheel, and is so arranged that it traps any excess of oil from the timing gear bush and, by centrifugal force, throws it to the inside of the big end bearing through specially formed leads. As a proof of its efficiency, we may state that the experimental engine was running with no other oil hole to the big end, and the results have been excellent.



Valve side of the 1915 pattern 2¼ h.p. B.S.A., showing three-speed gear box and striking gear.



The three-speed gear of the 2¼ h.p. B.S.A. operated by double dog clutches.

A chain drive connects the engine to a three-speed gear box designed much on the lines of the standard and well-known B.S.A. gear. It is, of course, smaller, and has neither clutch nor kick-starter. A large diameter belt pulley is fitted, and the final drive is by means of a ⅞in. belt. The ratios supplied as standard are 5.7 to 1 on top, 8.5 to 1 middle, and 15.9 to 1 low. The driving chain is carefully enclosed.

Little Things that Matter.

Passing on to the frame and fittings, we find that every detail has been carefully thought out, and, besides, a very stout and sensible frame, which is sprung in front by a modification of the B.S.A. fork, having round instead of oval section blades, large footboards, a pan seat, and 26in. wheels, all help to increase the rider's comfort. As on all other B.S.A. models, the mudguarding is particularly well carried out. The rear brake is heel-operated and acts internally on the belt rim, so that the wheel can be removed without interfering with the brake gear. The tank fittings are excellent, including as they do a screw-down petrol tap and a priming device for the cylinder. A large armoured tool bag is fitted at the back of the carrier.

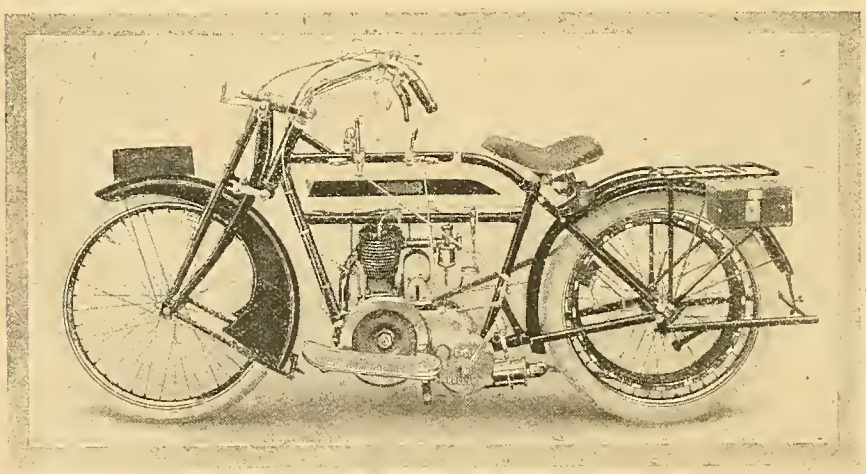
The whole machine is turned out in a most excellent manner. It does not look unduly small, and is in no way flimsy. For a high grade machine of medium power, it will be difficult to find a more inviting proposition at the price of forty guineas than the new 2¼ h.p. B.S.A.

A NEW EYSINK.

An Up-to-date Machine of Dutch Origin.

THE name of Eysink will not be altogether unknown to many readers of *The Motor Cycle*, in view of this machine's appearance in various Anglo-Dutch trials. It is a Dutch-built machine, its home being in Amersfoort, and in general design it bears a strong resemblance to the average English single-cylinder machine.

Several models are made, but the one illustrated is typical of the general design and construction of all. This is a 3 h.p. single-cylinder machine. The engine dimensions are 74 mm. × 85 mm., which give a capacity of 365 c.c. The valves are of the side by side mechanically-operated type, whilst the magneto is placed in an accessible position just behind the cylinder. It will be noticed from the illustration that an outside flywheel is employed, also that a totally enclosed kick starter is embodied with the countershaft two-speed gear. The drive is by chain to the countershaft, and thence to the back wheel by belt.



Flywheel side of the new 3 h.p. Eysink—a motor bicycle of Dutch origin.

The other Eysink models are as follow: 2½ h.p. single-cylinder 60 mm. × 85 mm. (309 c.c.), 3½ h.p single-cylinder 74 mm. × 95 mm. (409 c.c.), and 6 h.p. twin-cylinder 74 mm. × 85 mm. (732 c.c.) Prices vary from £57 10s. for the 2½ h.p. machine to £74 for the twin-cylinder.

From the foregoing it will be gathered that, broadly speaking, the Eysink machines follow standard practice, and, indeed, have British fittings incorporated in their design. It only remains to be added that the mudguarding, springing, equipment, etc., appear to be all that they should be.

October 22. 19

Messrs The Palmer Tyre Coy Ltd
London. E C.

Dear Sirs

On the 11th of August last, a few days before my departure with the British Expeditionary Force, I fitted my Machine (4 HP TRIUMPH) with a pair of "Palmer Cords" and up to date although the machine has been in use every day in all weathers over the worst possible roads - I have not had occasion to touch either tyre since I left England. This is surely a tribute to "Palmer" quality.

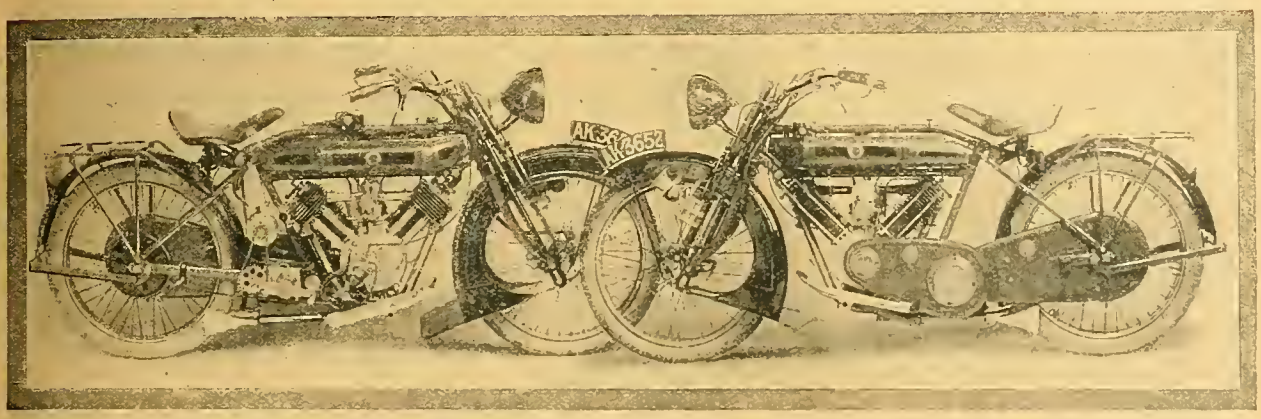
THE 6 h.p. P. & M. TWIN.

Four-speed Gear: 90° Engine of 770 c.c.; Protected Valve Springs and Tappets.



The 6 h.p. twin P & M. with Lucas dynamo set. Transmission side showing enclosed chain cases

THAT Messrs. Phelon and Moore were bringing out a twin-cylinder model has for some time been an open secret, but it was not till early this year that the news leaked out that it would be fitted with a 90° twin. A short time ago we published preliminary details of an experimental machine which was a prototype of the model we are about to describe. This early machine had the standard two-speed gear, but the new type has four speeds, and several interesting details besides. Through the courtesy of Mr. R. Moore, we are able to give the first description of the new P. and M. in its final form.

One of our illustrations gives a clear idea of the engine, and since the carburetter has been removed a good view is given of the magneto and its cleverly enclosed drive. The latter is carried out in the following manner: A bevel fixed behind one of the timing wheels meshes with a crown wheel at the bottom of the vertical shaft, while the final drive is conveyed to the magneto by means of skew gearing. The aluminium case enclosing this is in two portions, held together by wing nuts, so that the top half may easily be removed for inspection. The pinion on the magneto spindle, the end of which is tapered, is fixed by means of a combined nut and washer, which, when unscrewed, tends to withdraw the pinion, thus doing away with the necessity of prising it off. To detach the magneto, it is only necessary to loosen a screw, drop down the lower half of the cover of the gearing, undo the nuts, and remove the magneto complete with base plate.

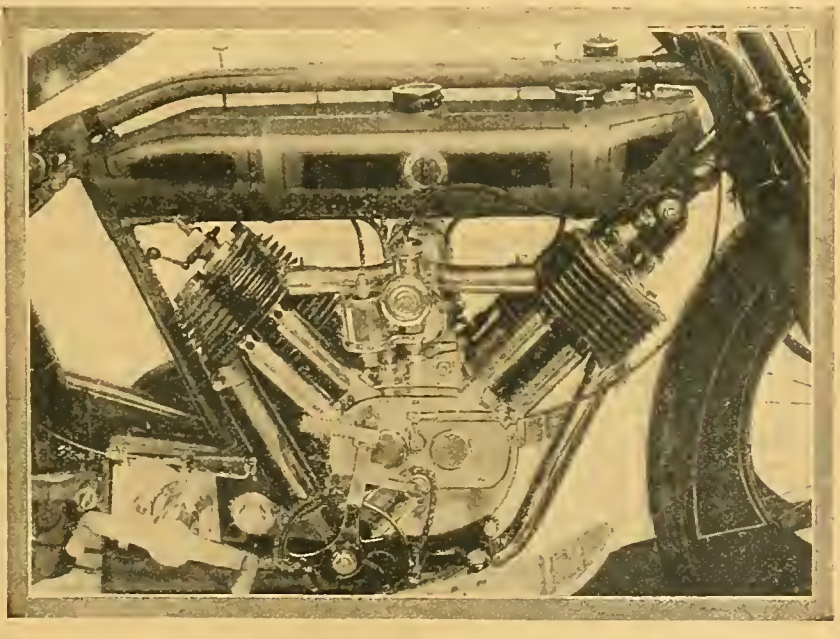
Features of the Engine.

Owing to the cylinders, the dimensions of which are, by the way, 76 × 85 mm. (770 c.c.), being arranged at an angle of 90°, the balance is excellent, and, in consequence, the smooth running is all that can be desired.

Simple and ingenious shields are provided to protect the valve springs and tappets, which may be described as half tubes of spring steel which clip into position. These serve to keep dust from the tappets and prevent the oil from running on to the crank case, which the makers take an especial pride in keeping clean. Considerable ingenuity has been displayed in the design of exhaust lifter. A pinion is keyed to the spindle attached to the arm visible in an illustration, which is connected to the Bowden wire mechanism. This pinion meshes with two wheels; one portion of the periphery of these is toothed and the other forms a cam, and these cams are forced up against the exhaust valve rockers when the Bowden lever is worked. Lubrication is effected by means of an Enots lubricator, which delivers the oil through the pipe just visible in the illustration to a point in the crank case adjacent to the front cylinder. Here the oil enters a channel which conducts a portion to the front cylinder, so that the piston picks it up at the bottom of every stroke, while the remainder is allowed to drip on the connecting rods. This method permits an ample amount of lubricant to reach the front cylinder, while the back one receives sufficient through splash

The Four-speed Gear.

Next to the engine, the most interesting portion of the machine is the four-speed gear, which is arranged in a most ingenious manner. It is a clever combination of two well-known successful systems, of which one is an improved form of P. and M. gear, and the other an ordinary dog clutch two-speed gear box. The P. and M. gear has been improved by the introduction of wider expanding rings and wedge bars, which are now split so that any wear which takes place may be taken up by inserting

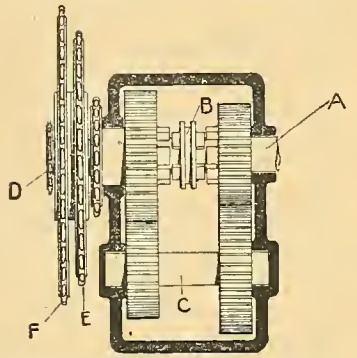


A closer view of the 6 h.p. engine, showing enclosed valves, gear box and operating pedal

C

The 6 h.p. P. & M. Twin.—

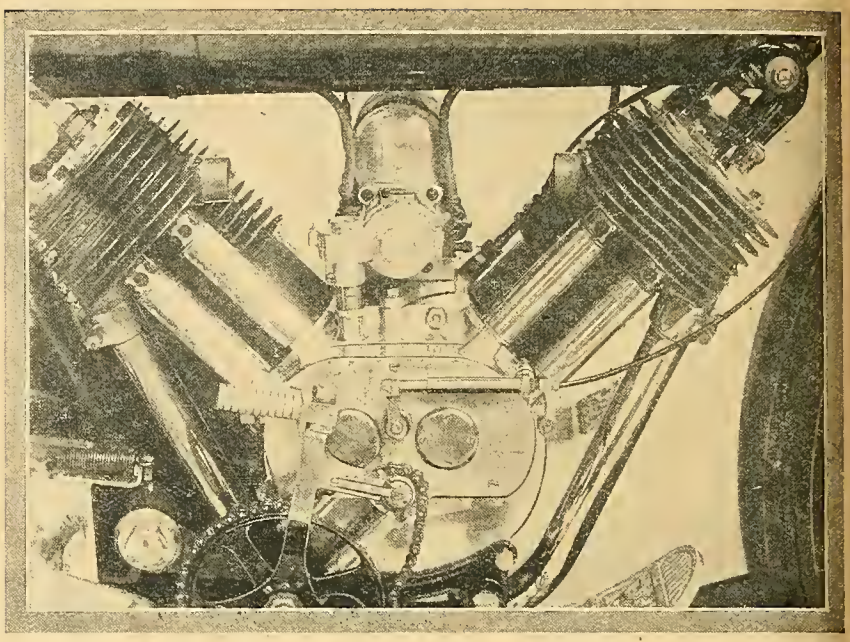
thin correctly shaped metal plates. A good idea of the arrangement may be gathered from the diagrammatic drawing. The shaft A, on which the dog clutch B slides, revolves independently of the chain wheels F E and both gear wheels, unless locked to either of the former by the expanding rings, or to either of the latter by means of one of the two sets of dog clutches. The first speed is obtained by sliding the dog clutch B to the right, which has the effect of lowering the ratios of the two P. and M. gears. If moved to the left the pinions in the gear box are idle, and the original P. and M. gear gives the higher speeds which are both direct. A pedal is used to bring the P. and M. gear into action, while a lever on the handle-bar is



DIAGRAMMATIC SKETCH OF P. & M FOUR-SPEED GEAR.

A. Gear shaft.
B. Dog clutches solid with A.
C. Lay shaft.
D. Expanding gear mechanism.
E. High speed chain wheel.
F. Low speed chain wheel.

employed to engage the dogs. It is interesting to note that no free engine position is given for the lever controlling the gear box. Such would be unnecessary, and may be explained more clearly by pointing out that the gear box merely serves the purpose of lowering the ratios of the P. and M. gear, and no matter whether the gear box is in operation or not the expanding gear serves as a friction clutch on either of its speeds for starting purposes. The gear ratios are 4½, 6, 8, and 11½ to 1 respectively. In practice it is found that the fourth and third gears



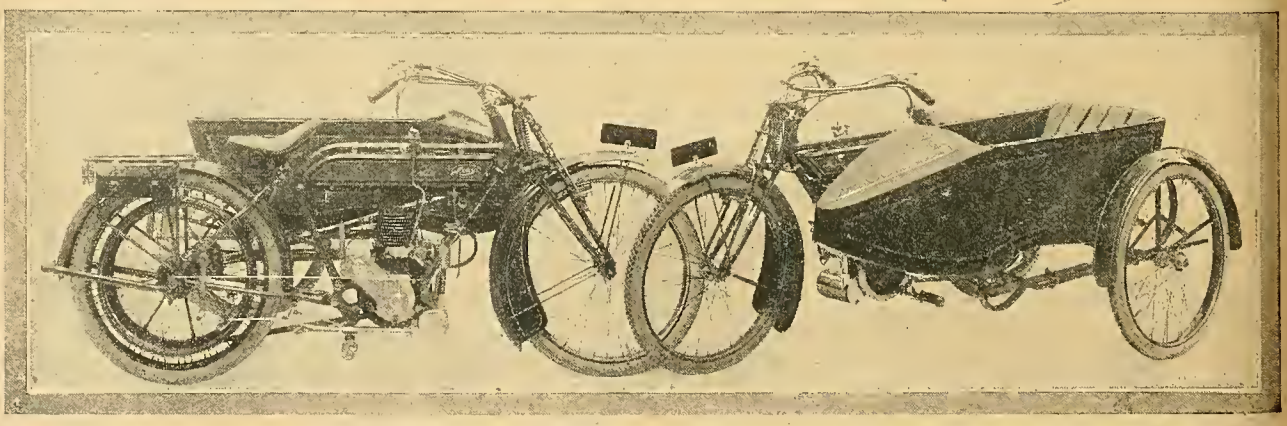
The 6 h.p. P. & M. engine with carburetter removed to show neat magneto drive.

suffice for all ordinary districts, and that the second and first are really only for emergencies.

The 6 h.p. P. and M. is essentially a sidecar machine, and since no up-to-date sidecar combination would be complete without a dynamo outfit, provision for this has, of course, been made. The excellent Lucas installation can be supplied; this has already been described in *The Motor Cycle*, but the most interesting feature is the method of transmission. A spindle runs through the bottom bracket just behind the gear box on which two chain wheels are fixed, one driving the dynamo, while the other is driven by the chain from counter-shaft to rear wheel. This latter runs inside the chain case, while the former is also adequately protected, though its cover is not shown in the illustration.

The tank, which is of particularly pleasing design, holds two gallons of petrol and two quarts of oil, while large glass topped filler caps are provided. Owing to the engine forming part of the frame, the wheelbase of the 6 h.p. model is only half an inch more than that of the 3½ h.p., and it is worthy of note that the sidecar lugs form part of the frame. Kempshall 650 mm. × 65 mm. tyres are fitted. Other portions of the machine to which we have not referred, such as transmission, forks, footrests, etc., follow P. and M. standard practice, and the finish, needless to say, is superb. Mr. Moore himself met us at Bradford Station with the original two-speed 6 h.p. model, and drove us back from the works at Cleckheaton in a most luxurious sidecar attached to the actual machine from which these photographs were taken. It started from rest on third speed, and took all gradients on top despite a very strong wind. The engine pulled remarkably well, and ran with a smoothness rarely found in petrol motors of this type.

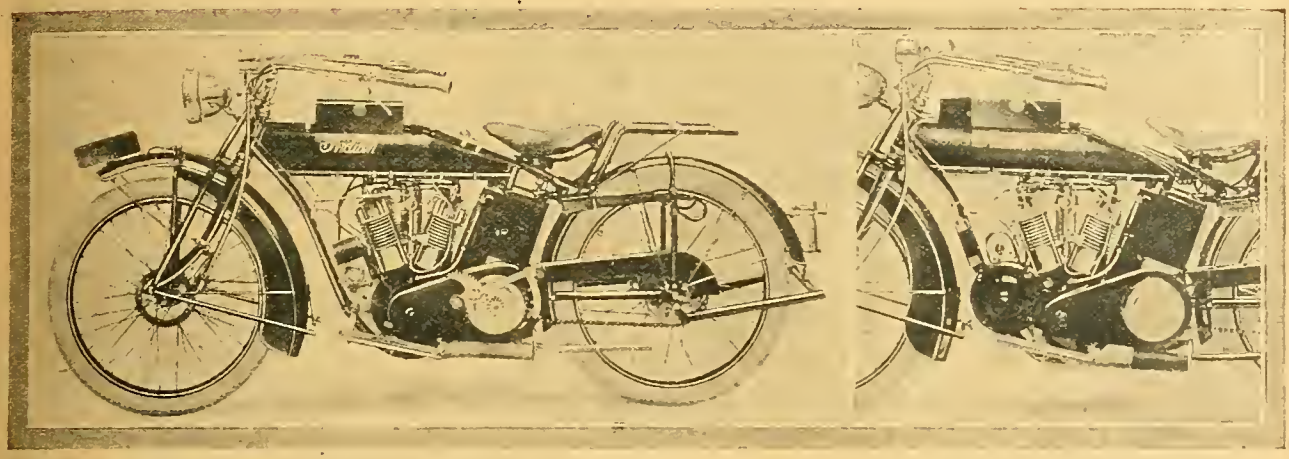
In conclusion, we may say that this model is quite the best produced at Messrs. Phelon and Moore's works, and we prophesy a particularly rosy future for it.



Both sides of the lightweight two-stroke Ixion sidecar outfit propelled by a 2¾ h.p. Peco two-stroke engine. (See page 570.)

INDIANS IN 1915.

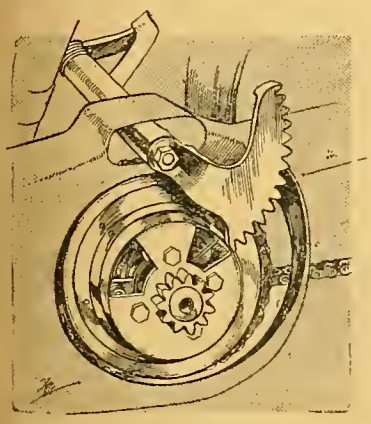
All Twin-cylinders—Three-speed Standard.



The 7 h.p standard Indian fitted with three-speed gear and electrical equipment

Power unit of the 1915 Hendee Special, which has an electric starter

THE 1915 Indian models are really excellent examples of the very best in motor cycle manufacture, not only as regards finish and general appearance, but also in ingenuity. The models to be placed on the British market for the coming season are the



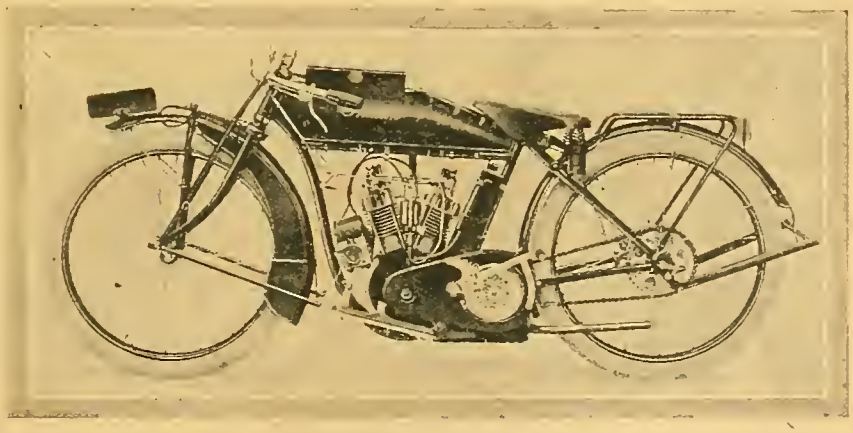
The clutch and kick starter fitted to the new twin-cylinder Indians.

following: a 3½ h.p., bore and stroke 70 mm. × 74.5 mm., 574 c.c.; a 5 h.p., 70 mm. × 89 mm., 684 c.c., which is a slightly larger replica of the former; the 7 h.p. standard model, 82.5 mm. × 93 mm., 994 c.c.; the Hendee Special, which is of the same size, and like the other, fitted with spring frame, and dynamo starting and lighting; and, lastly, the 7 h.p. racing model, fitted with the same size engine, but with single gear and clutch. It is provided with special cams and valves, and is built for speed alone, while it is interesting to note that every engine fitted to this model is guaranteed to give 20 h.p. on the brake.

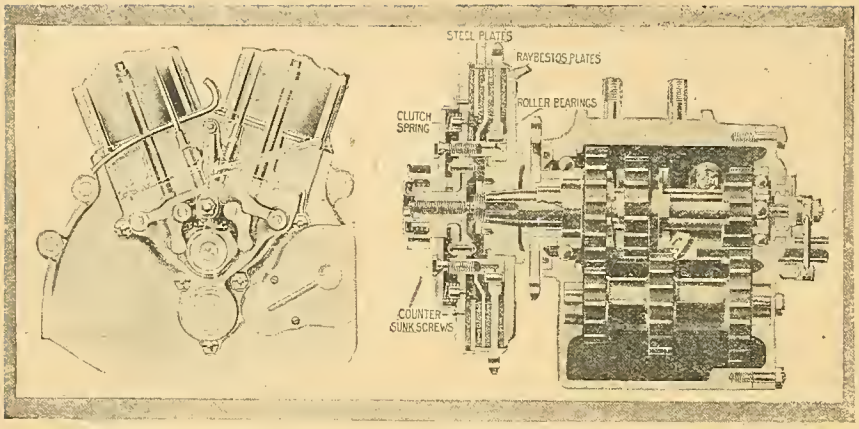
The first model to come to our notice is the 3½ h.p., which is quite one of the most fascinating little solo mounts we have yet seen. The engine is of sufficient size to give as much speed on the level and on hills as the most enthusiastic rider may desire, yet with the excellent automatic carburetter fitted it is tractable and easy to handle. The low saddle position is particularly noticeable in the accompanying illustration, being two inches below the level of the top tube. The engine, the prototype of which took part in the Tourist Trophy Races this year, does not outwardly show much difference from the firm's previous models, but it is interesting to note that the main supply of oil is introduced to the engine through the front cylinder. A useful refinement is the addition of a petrol filter or separator below the carburetter. The exhaust valve lifter arrangement is the same as has been fitted to the 7 h.p. machines.

Larger Clutch Surface.

It is, however, in the gear and transmission that the chief improvements in the 1915 Indian have been made; these improvements, by the way, are common to all the models. The clutch is a beautiful piece of work, and as in previous models consists of Raybestos and steel discs, but this year's clutch has one-third more surface than formerly, and when in the free position the large size chain wheel runs on hardened steel roller bearings. We recently saw one of these clutches taken apart by Mr. Wells in the space of about five minutes. The external plate is kept in position by means of countersunk screws, the heads of which are cone-shaped and possess several shoulders on them which engage with corresponding grooves in the countersunk holes, these grooves serving to lock them in position as the plate is pressed up against the screw-heads by means of the clutch springs, consequently there is no fear of their coming out. The clutch springs are fitted over a series of studs in the outer of the steel plates. Normally, eight are fitted, but if eight are insufficient to take up the load without slipping, twelve or even sixteen may be put into position, and all this can be done in a very short space of time. The clutch



The new 3½ h.p. three-speed Indian (Model A)



The valve gear of the twin Indians.

Section of the countershaft three-speed gear and clutch

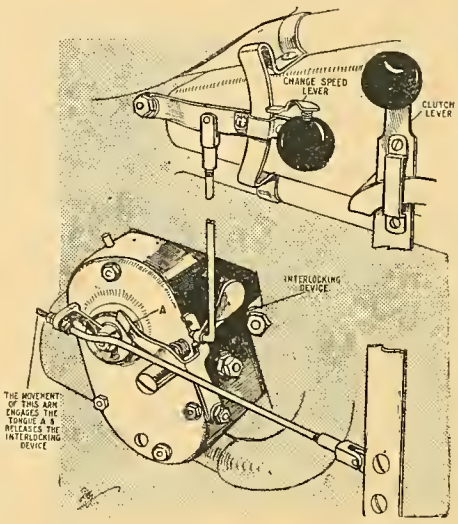
itself is operated by a quick thread on the near side of the gear box which runs through the main gear shaft. The lever working the thread is attached to a rod coupled to the main clutch lever, which in turn is connected to a pedal, so that the clutch may be operated either by hand or by foot. Connected to the clutch rod is an interlocking device, working in conjunction with the change-speed lever which prevents the gear lever being moved while the clutch is in engagement. This device is clearly shown in the accompanying sketch. Turning now to the gear box, an interesting feature is the spring bolt which locks the striking rod and holds the gears in engagement. That portion of the rod which projects through the gear box is protected from the elements by means of a dust cap. This arrangement is similar to the locking device to be found in the change-speed gate of a car. The illustration of the gear box shows the top speed about to come into engagement by means of dogs. In the change-speed lever the only notch is for the middle gear, since the spring plunger serves the purpose of notches in the quadrant. Other detail improvements are the fitting of large filler caps and an auxiliary release to the exhaust. An excellent feature is the kick-starting arrangement, which is a really substantial job.

Testing the Materials.

The 7 h.p. very closely resembles the smaller model we have just described, with the exception that the bigger machines have spring frames and that the kick starter, when fitted, is on the off-side of the machine. This is very convenient when used in conjunction with a sidecar; on these larger models a $\frac{3}{8}$in. Renold chain is standard.

The works in Springfield, U.S.A., are equipped with a magnificent laboratory in which the materials employed are most carefully tested. The result of these tests has been the adoption of Vanadium steel for the frame tubes, which is three times stronger than the reinforced carbon steel tubes previously employed. Another point of interest is that the new fork stem, which is reinforced by three separate pieces of tube brazed together inside, and locked by a loose piece of tube expanded at each end in the centre of these, is seven times stronger than the fork stems in earlier models.

To sum up, the Indian range for 1915 is easily the most attractive yet offered to the public by the Hendee Co., and therefore bound to enhance its popularity.



CHANGE SPEED LEVER
CLUTCH LEVER
INTERLOCKING DEVICE
A
THE MOVEMENT OF THIS ARM ENGAGES THE TONGUE A & RELEASES THE INTERLOCKING DEVICE

Indian interlocking device for gear and change-speed lever. The movement of the operating arm engages the tongue A and releases the interlocking device.

THE ARIEL TWO-STROKE.

SINCE illustrating and publishing the essential features of the new two-stroke Ariel in our issue of October 29th, the final design has been approved of, and we are now able to give further details of the machine and an illustration as it will be placed on the market.

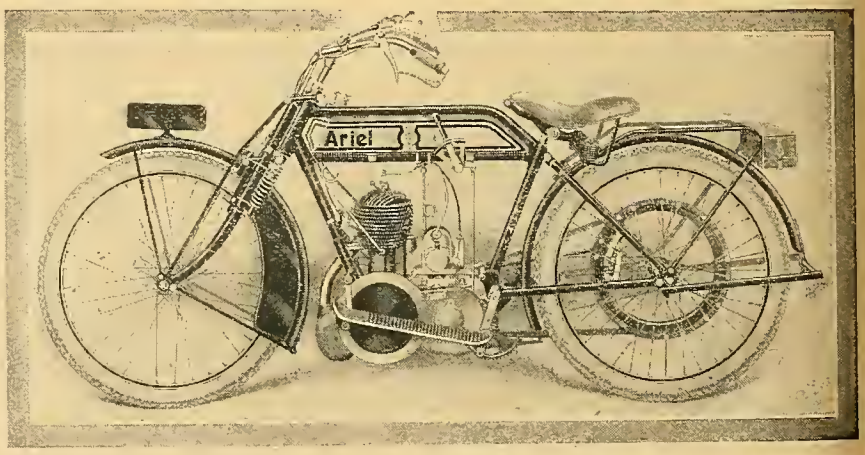
As stated in the previous article, the engine is of the three-port two-stroke type, having a bore and stroke of 75 mm. × 79 mm. The cubic capacity is 349 c.c., and it is rated at 2¾ h.p. A two-speed gear is employed, together with countershaft drive, the chain being enclosed by an aluminium case. Somewhat unusual fittings on this type of machine are the clutch of the cork insert type—and the kick starter. The former is similar to that fitted to the three-speed countershaft Ariel, and is hand applied. A Senspray carburetter has been adopted, and handle-bar control throughout is standard.

The tank has a capacity for one gallon of petrol and one quart of oil. Under normal conditions the makers claim a petrol consumption of 80 to 90 m.p.g.

It is capable of speeds up to about 35 m.p.h. The weight complete for the road is 160 lb with such features as a clutch, kick starter, and two-speed gear. The Ariel two-stroke should be capable of serious touring work, and fulfil all the requirements of the solo rider.

Other Ariel Models.

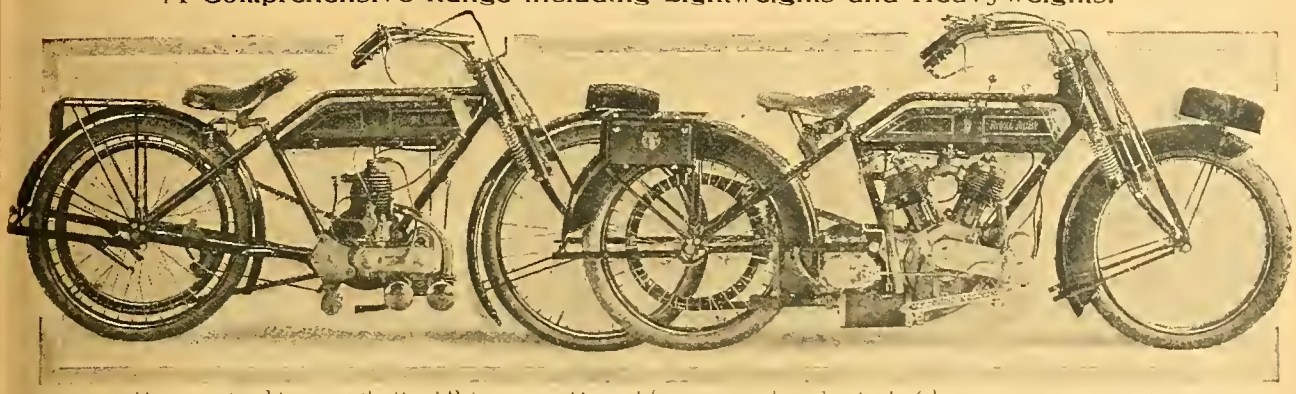
The other Ariel models for next year are the same as those listed in 1914, only modified and brought up to date in detail. These are the 3½ h.p. three-speed countershaft, the 3½ h.p. single-geared touring and T.T. models, and the 5-6 h.p. twin-cylinder three-speed countershaft models. As suggested, no material alterations have been found necessary, and those detail improvements made have been tested during the big competitions in the pre-war period.



Flywheel side of the latest 2¾ h.p. two-stroke Ariel.

ROYAL RUBYS FOR 1915.

A Comprehensive Range including Lightweights and Heavyweights.



The smallest and largest of the Royal Ruby range. On the left the two-stroke and right the 6 h.p. twin three-speed machine.

THE manufacturers of the Royal Ruby motor cycles have a comprehensive range of lightweights, both two-stroke and four-stroke, for the coming year. In addition, 3½ h.p. and 6 h.p. models will form an important part of the programme, but in view of the present interest in light, low-powered machines, and the choice of type offered by the Royal Ruby Cycle Co., we shall confine our remarks mainly to these types.

First of all, the simplest and cheapest Ruby lightweight is the 2½ h.p. two-stroke, which, with single gear and belt drive, sells at 25 guineas. The engine is a Villiers 70 mm. × 70 mm. = 269 c.c. The carburetter is an Amac Special, and lubrication is from a separate chamber in the tank, through a Best and Lloyd sight drip lubricator, and through the carburetter to the engine. Moseley 26in. × 2in. rubber studded tyres are the standard fitting.

A similar model is listed with a four-stroke J.A.P. engine of 70 mm. × 64 mm. (246 c.c.) It is fitted with an adjustable pulley, and the magneto is gear driven. Both the foregoing can be fitted with Albion two-speed countershaft gear or the Sturmey-Archer three-speed hub gear.

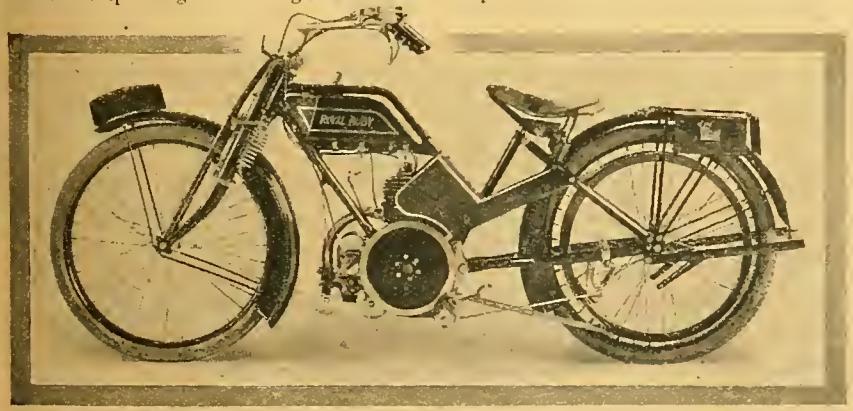
Realising the popularity of the pastime among the weaker sex, there is a lady's edition of the Royal Ruby lightweight. This is fitted with the Villiers two-stroke engine, and, with the exception of the frame and special guard arrangements the general specification is the same as for the preceding models.

Further, there are de luxe models of both the two-stroke and four-stroke lightweights. The engines are the same, *i.e.*, Villiers and J.A.P. respectively, but the regular equipment includes Sturmey-Archer three-speed hub, and the general specification is of a higher order than the standard models, Roman rims being included as a standard fitting.

A J.A.P. engine (85½ mm. × 85 mm.) is fitted to the Royal Ruby 3½ h.p. standard touring mount. The engine is one of the latest J.A.P. productions, it being fitted with a new type of timing gear, adjustable tappets, internal exhaust valve lifter, and decompressor. In addition the power unit includes the J.A.P. adjustable pulley. The specification is attractive, including, as it does, Saxon or Druid forks, B. and B. carburetter, Dunlop 2in. belt, and Brooks saddle. The price of fifty-four guineas includes Sturmey-Archer three-speed and free engine hub. This model is also supplied with a countershaft drive, in which case the gear is the maker's own three-speeder.

Two twin-cylinder machines are also listed, these being J.A.P. engined. The 6 h.p. is 76 mm. × 85 mm., and the 8 h.p. 85½ mm. × 85 mm. The drive is by combined chain and belt, the gear being the Royal Ruby three-speed with free engine and kick starter.

The 3½ h.p. and twin cylinder machines are fitted with back guards provided with easily detachable fitments. These enable a mudguard to be taken out completely with the carrier by the removal of four set pins.



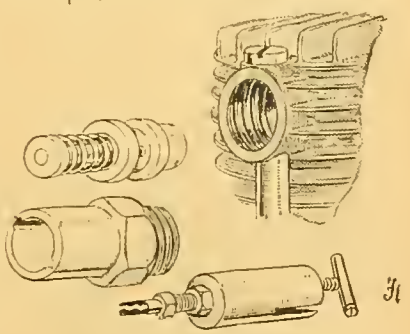
Lady's new model Royal Ruby two-stroke machine standardised for 1915

VELOCETTE IMPROVEMENTS.

IT can scarcely be said that Messrs. Veloce, Ltd., have designed a new machine for the coming year, and yet the improvements are of considerable importance, and should still further increase the comfort and sweet running of the little engine.

Crankshaft Balance Weight.

Perhaps the most important, and also the most unusual, feature is the addition of a balance weight, which is mounted on a fixed spindle on the opposite side of the crank case to the drive, and is driven merely by the crank pin, which fits loosely into a hole.

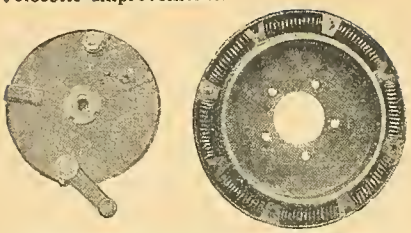


Details of enclosed release valve on the latest type of Velocette

This addition has been found to give extremely steady running, and it has all the advantages of the usual type of crankshaft without the attendant disadvantages of a second bearing to cause pressure leakage or oil throwing.

The lubrication has been modified, and the pressure pipe from the exhaust to the oil well is no longer utilised. Instead of this, the oil is fed direct to the main bearing, and thence through ducts to the big end. The slot in the big end bearing, which used to be a feature of the system, is now no longer maintained. A very simple arrangement for leading the release gases into the exhaust port has been incorporated with the cylinder, the whole mechanism

Velocette Improvements.—



Spring shock absorber and part of internal expanding brake on Velocette drive.

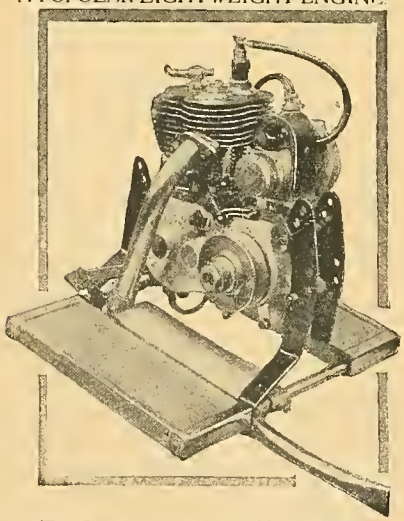
being neatly and simply enclosed; the operating plunger for the valve is worked by the outside member of the Bowden casing. The new silencer is somewhat bigger, and adds to the quietness of the machine.

Good Brake Work.

Chain drive throughout is still used on all the two-speed models, but a spring shock absorber is fitted within the big sprocket, and a very effective internal expanding brake is mounted in the rear hub. This brake is of large diameter and easy of access, while, being of the internal type, it keeps clean and free from grit. Both chains are protected by metal cases. Other frame details consist of a considerably strengthened carrier and an excellent spring-up stand.

A single-geared model may be obtained, but it will be fitted with a countershaft and chain-cum-belt transmission. The two-speed gear is a particularly neat piece of mechanism, and instead of utilising the usual sliding dogs a very large and powerful sliding keyway effects the same end, and is infinitely simpler to construct and to operate. The alternative gear ratios are 5 to 1 and 10 to 1, or 5½ to 1 and 11 to 1. Another neat fitting is the flywheel locking nut, which is so arranged that when unscrewed it removes the flywheel without any special tools.

A POPULAR LIGHTWEIGHT ENGINE.

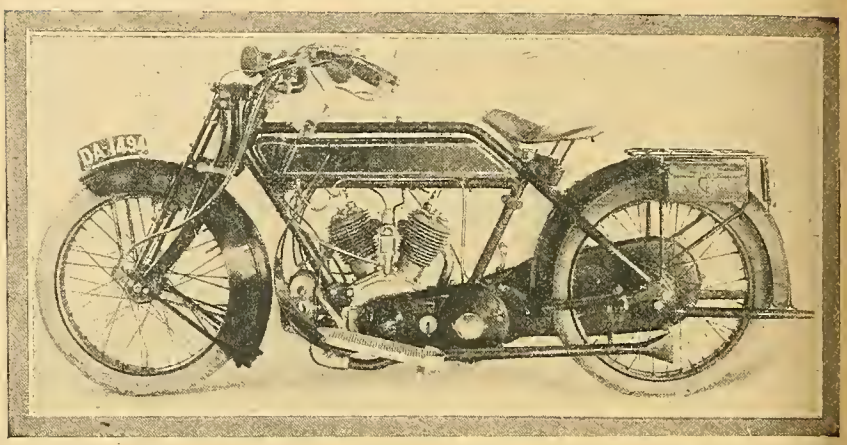


The Precision Junior for 1915, which, as will be seen, has vertical valves. This engine, which measures 65×60 mm.=199 c.c., is fitted to a number of machines included in the Buyers' Guide.

C10

THE NEW TWIN SUNBEAM.

6-7 h.p. Engine, Re-designed Gear Box and Clutch.

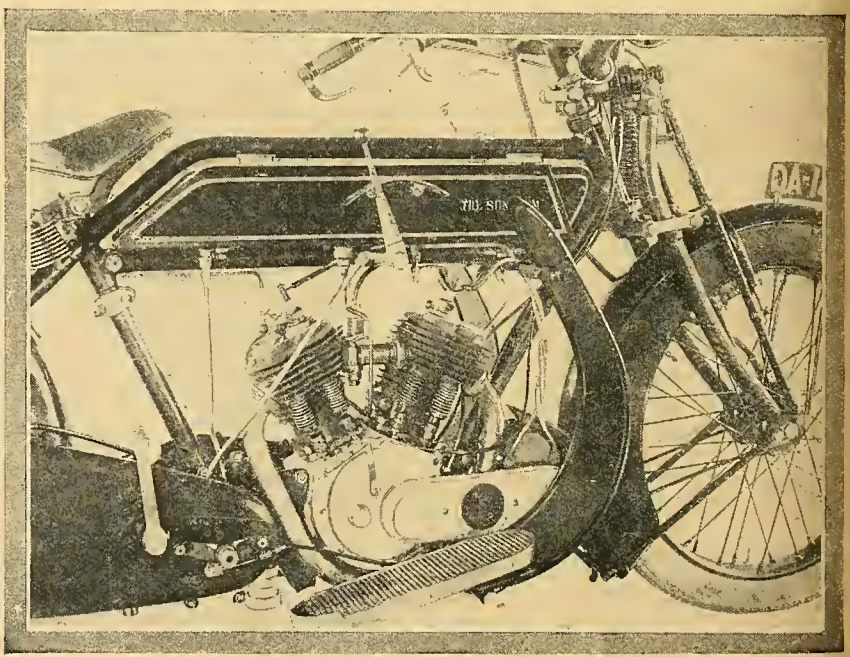


The 6-7 h.p. Sunbeam three-speed machine which has been redesigned for 1915.

THE most novel machine of the Sunbeam 1915 range is the twin-cylinder 6-7 h.p. machine. An entirely new engine is fitted to this mount of a bore and stroke of 73×95 mm., giving a capacity of 796 c.c. The valves are of the mechanically-operated side-by-side type, a new design silencer is used, but the most important change apart from the engine is the new gear box, which is much stronger than formerly, and the change of gear is effected by a pair of sliding clutches actuated by a rack and pinion and a cam action. The gear teeth are very wide and strong enough for almost any work. In addition to the gear, the clutch as well as the operating mechanism has been re-designed for next year. Last year the plates were carried on pins; they are now supported on keys, and there are seventeen plates in the new design, nearly double last year's total, thus giving increased frictional surface.

The mudguards have been greatly improved, and leg shields are also fitted in front of the footboards. The wheels are, of course, detachable and interchangeable as before.

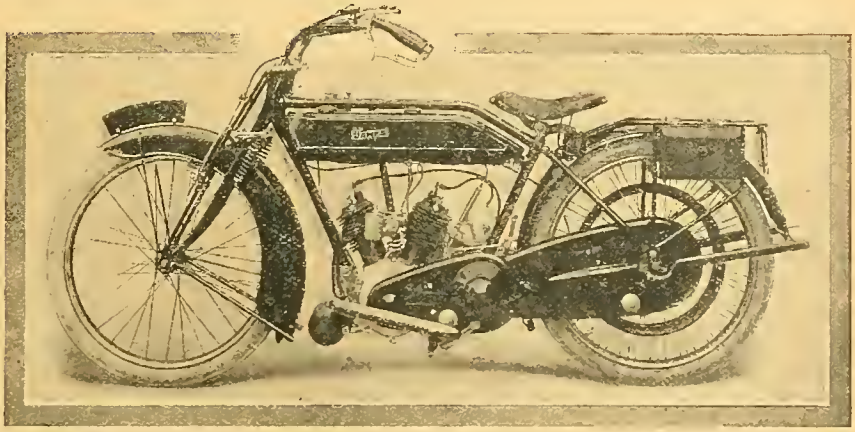
The engine of the 3½ h.p. machine has also undergone various alterations, though the bore and stroke remain as before. The magneto is now driven by a silent chain. The improvements in connection with the gear and clutch also apply to this model. The 2¾ h.p. mount remains practically unaltered for 1915, so satisfactory has it proved.



Valve side of the new 6-7 h.p. engine fitted to the twin Sunbeam.

JAMES MODIFICATIONS.

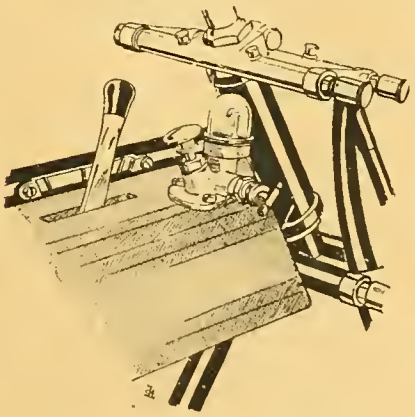
THE James Cycle Co., of Birmingham, have decided only to modify their present types, as they find no necessity to make alterations. They have entirely dropped all belt-driven models with the exception of the little two-stroke, which will remain exactly as before, except for the fact that the choice of 26in. or 24in. wheels is given. The big single will be marketed with both two and three-speed gears, and in main details remain unaltered. Some parts of the frame have been reinforced, though they retain their original appearance. One of the most striking alterations is the removal of the change-speed lever from the side to the centre of the tank; this now passes through a slot working in a gate on the side of the top tube. This allows the tank capacity to be increased by widening the tank without interfering with the rider's comfort. Two gallons of petrol are now carried without causing any unsightly projections. All riders will appreciate the fact that grease cups are fitted to all the spring fork shackle pins, which permit proper lubrication of this important part without fiddling with tiny lubricators. Both chain cases are now provided with neat inspection caps, which are instantly detachable, and permit a clear view of the lower part of the chain. The cases themselves are split horizontally instead of vertically as before, and appear absolutely flush without projections. The hubs have an all-black finish, and the front hub with its Timken roller bearings can now be adjusted readily.



1915 model 3½ h.p. twin-cylinder James, which is a combination of last year's T.T and touring types.

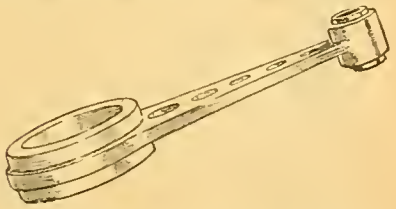
The 3½ h.p. Twin.

In the case of the 3½ h.p. twin the alterations are somewhat more noticeable, though in reality only detail refinements have been carried out. A similar frame to that used in the Isle of Man is now employed with a very strong design of steering head. The gear control has been carried rather further forward so as to be in an accessible position, and clear of the rider's knee. The rear brake will in future be heel applied, and the chain case and the spring fork grease cups are, as already described, as on the big single. Arrangements have been made for fitting the Lucas lighting set as an extra, the dynamo being carried in a specially adapted bracket in the saddle tube. The drive is, however, an extension to the gear shaft, and the whole thing is extremely well carried out. Another addition which can be obtained in the extras is a most excellent leg guard, which thoroughly protects the rider on the muddiest of days. Although this guard appears to cover most of the front of the machine, it has been found that it does not in any way affect the cooling.

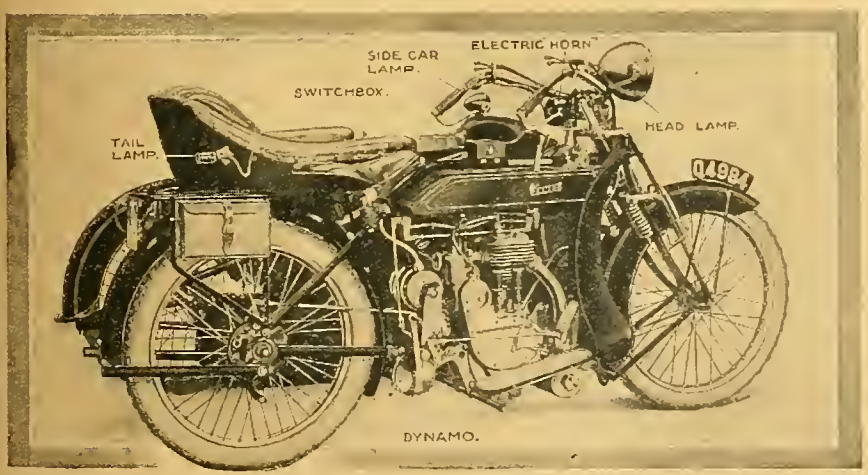


New gate change, and grease cups to front fork shackles on "Big Single" James.

The James sidecar combination with these extras is one of the most complete and comfortable outfits we have ever seen. The sidecar wheel is sprung, and the attachments to the motor cycle are excellent. The chassis remains as before.



The big end of the Omega connecting rod is hardened, and serves as the outer shell of the roller bearing. This machine was described on page 508B (Nov. 5th).

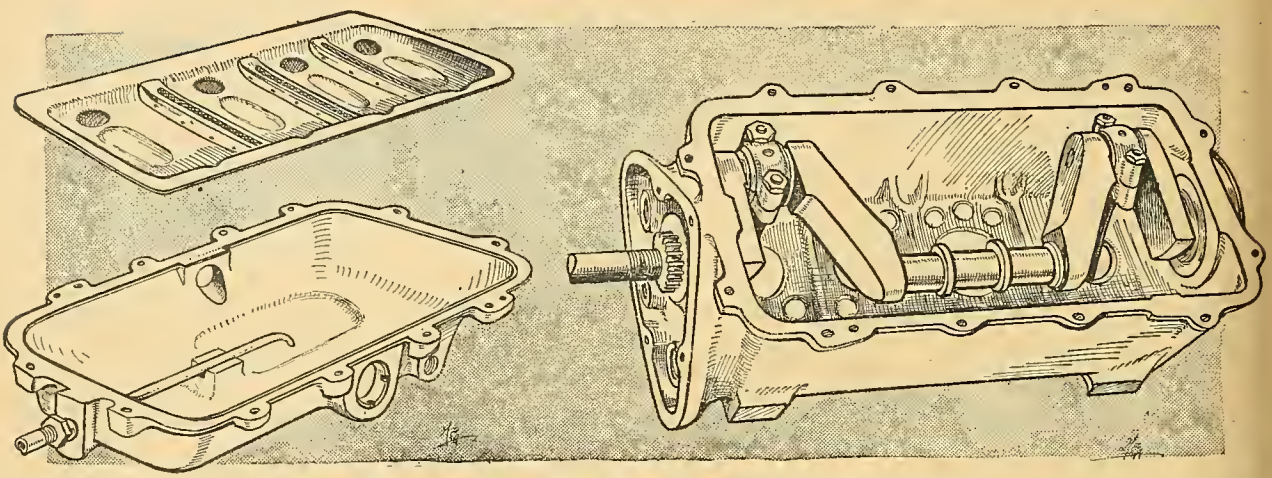


James-Canoelet sidecar combination for next year, fitted with Lucas dynamo lighting set.

THE JARDINE FOUR-SPEED GEAR.

One of the most interesting four-speed gears, which it will be noted from the Buyers' Guide is a standard fitting on certain machines, is the Jardine, which was fully described and illustrated in our issue of October 8th. We are led to refer to the Jardine again, as the makers inform us that the trial gear has now completed 3,700 miles without being touched. Mr. George Hunt, who has used it on his 8 h.p. Campion sidecar, tells us that he has done his best to break the gear through intentional ill-treatment, but without result. It may be recalled that this machine took part in the hill-climbing expedition on Grindon, Littonslack, Cowdale, etc., chronicled in our issue of October 29th.

Lubrication on the Latest F.N.



CRANK CASE OF THE 7 h.p. F.N. FOUR-CYLINDER ENGINE.

Fig. 1.—Showing oil sump and lower half of base chamber.

Fig. 2.—View from underside showing three-throw crankshaft and two of the connecting rods in position.

WE recently had an opportunity of inspecting some of the parts of the latest type four-cylinder 7 h.p. F.N. The method of engine lubrication is an interesting feature, and the illustrations deal chiefly with the excellent system which has been adopted on this interesting motor bicycle.

Fig. 1 shows the lower half of the crank case and oil sump, and the pipe through which the oil is drawn from the sump to the troughs shown in the tray which fits above this portion of the crank case. Here may be seen the four troughs in which the big ends dip and the gauzes through which the oil returns to the sump after being utilised. It is also interesting to note the two windows in the bottom half, by means of which the level of the oil may be seen at a glance. The upper half of the crank case to which the sump is attached is shown upside down for clearness, and demonstrates the three-throw crankshaft provided, the two outer connecting rod big ends being visible in position on their journals.

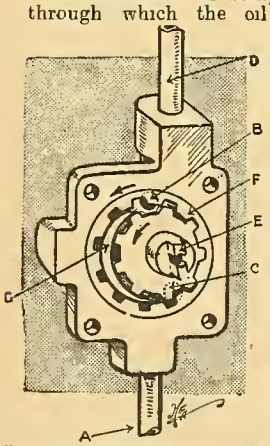


FIG. 3.—ROTARY PUMP ON THE LATEST FOUR-CYLINDER F.N

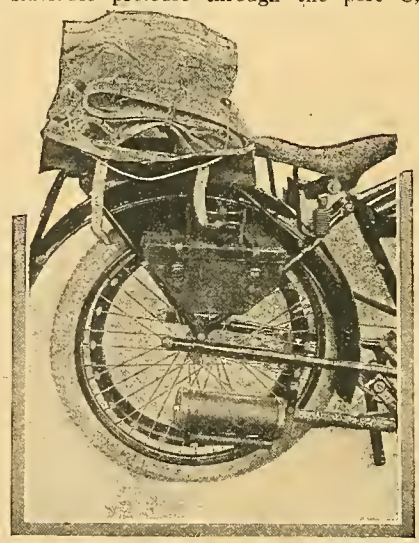
A. Inlet pipe from sump connecting to B.
B. Inlet port to pump chamber.
C. Delivering port from pump chamber.
D. Delivery pipe to bearings.
E. Gear wheel.
F. Internally toothed ring.
G. Crescent-shaped baffle.

Fig. 3 shows the ingeniously designed rotary oil pump. It will be noticed that it consists of a small gear wheel E meshing with an internally toothed ring F, which revolves inside the main casting of the pump, while on the left of the gear wheel E is to be seen a crescent shaped baffle G. This also forms an integral part of the main casting and acts as a seal for the oil. The direction of rotation is anti-clockwise, as indicated by the arrows, and as the teeth of the small wheel begin to separate from those of the gear ring in the neighbourhood of the oil inlet port B a vacuum is caused, as the oil cannot reach this part owing to the crescent G and the proximity of the teeth on the right-hand side of the pump. To fill this vacuum oil is drawn up through the pipe A to the port B from the sump, and is then carried round in the notches between the gear teeth until the gradual closing in of the gear teeth towards the port C forces the entangled oil at considerable pressure through the port C, finally issuing from the delivery pipe D to the bearings and troughs.

It is really an education to examine one of these beautiful machines in pieces, and the sketches reproduced on this page give the reader a clear idea of the ingenuity displayed in the design.



The hold-all and complete equipment carried on the Zenith motor bicycles supplied to the War Office. The new design silencer is discernible.

THE ZENITHS FOR THE FRONT.

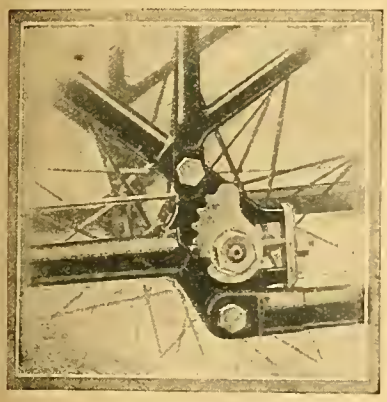
ON the occasion of a recent visit to the works of Zenith Motors, Ltd., Hampton Court, we saw about thirty military motor cycles, forming part of an order of 100 which the company had executed in three weeks for the War Office. These were practically standard 3½ h.p. single-cylinder models, which, by the way, the company have almost given up manufacturing, owing to the popularity of the twin. These machines were finished in all black, except the handle-bars and a square of slate grey on the tank. They were equipped with Amac carburetters, J.A.P. engines, and all black Powell and Hanmer lamps, horns, and generators. A square belt was neatly strapped to the side of the carrier, and on the carrier itself was placed a most convenient hold-all, designed by Mr. F. W. Barnes, the works manager. This device is constructed to carry the spare cover and two tubes required by the military authorities, but as it is capable of being extended, even more may be carried therein. It is made of Willesden canvas, and secured by good quality straps.

An interesting innovation on this machine is the new Zenith silencer, which consists of an expansion chamber and an exit pipe directly beneath it. This expansion chamber is at the extremity of the main exhaust pipe; it is an efficient silencer, and allows a perfectly free exit for the gases.

We hope shortly to deal with the other new model Zeniths, which are all fitted with twin engines

Countershaft Geared Rovers in 1915.

ALTHOUGH at first sight there does not appear to be any great change in the latest Rover models, yet, on examination, it will be found that the new machine has been redesigned from end to end. Starting with the engine, we find that the valve ports have been enlarged and improved, and the new valves have an extremely large port area. The timing gear also has been slightly altered, although it is on the same lines as before. Even the piston and connecting rod have been altered to a slight degree with results beneficial to the running of the engine. The driving side of the crankshaft is mounted on two separate ball bearings, so as to give ample surface to take the pull of the driving chain. A silent chain conveys the drive from the crankshaft to a three-speed countershaft gear; this chain is entirely enclosed in the die cast aluminium case. The three-speed gear box is of very neat construction, and has only sliding members, consisting of two rods and one gear wheel. The clutch is the cork insert type, and the kick-starter is neatly enclosed in an extension of the gear box. One of the most unusual features of the box is that the lid is formed by the bottom bracket framework, which gives a very neat appearance to the device and saves a certain amount of space. The final drive is through an 8in. pulley and a 1in. belt, the gear ratios being approximately 5 to 1, 7½ to 1, and 15 to 1, the lower gear being, of course, purely an emergency one. The gearshafts are mounted on ball bearings throughout.

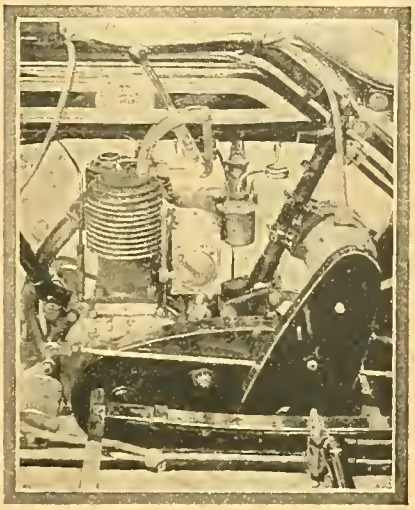


A flat plate with a series of notches is fixed on each side of the rear spindle on the new 3½ h.p. Rover, so as to ensure that the rear wheel is fixed in correct alignment.

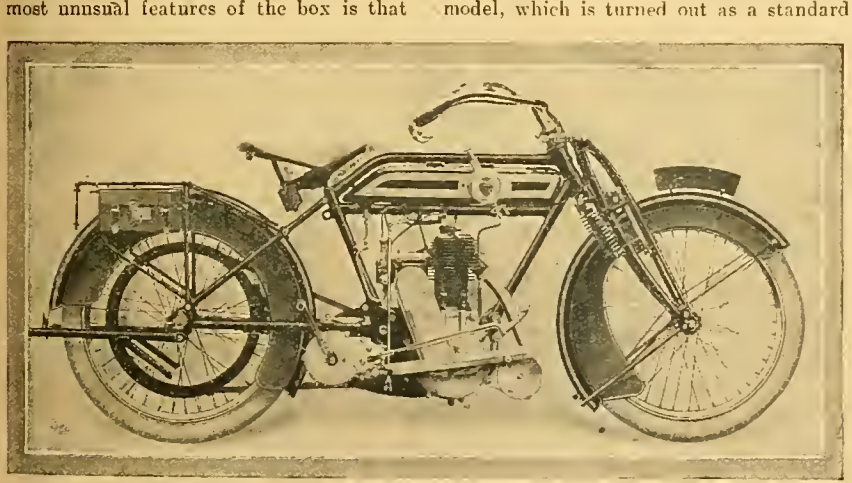
Frame and Fittings.

The frame alterations are not very noticeable, but besides the new bottom bracket lug, the steering head has been given an increased rake. 650 × 65 tyres will in future be fitted on all models, and excellent mudguards, which are fully valanced on both sides, protect the rider in bad weather. A belt guard is also standard, and the front portion of the rear guard is extended below the level of the lower part of the belt, so that mud cannot pour over it and cause slip.

The handle-bars are somewhat wider than in previous years, and are bent into a very comfortable position. The standard lubrication will be by plain pump fitted with a tap at the bottom, or Best and Lloyd's automatic drip feed can be obtained to order. The hinged carrier and guards and the powerful double lever in front of the brake will remain as in the 1914 model. A Lucas dynamo lighting set can be fitted as an extra, and, if supplied, it is fitted behind the saddle tube and driven by an enclosed chain from an extension of the countershaft. Sidecar chassis and body are modified in detail only, and the neat spring luggage carrier is still retained on the back of the chassis. The feature of this outfit is the compensated sidecar brake, actuated by the usual foot pedal on the motor cycle. A very neat fitting has been devised for ensuring that the back wheel shall be in line. This consists of a form of notched quadrant, carried on the spindle, the notches engaging with a projecting boss. It is only necessary to engage the same notch on each side of the wheel with the boss to make sure that the wheel is in proper alignment. A similar engine to that already described, but with slightly higher compression, is fitted to the T.T. model, which is turned out as a standard with a single belt drive, though a Philipson governor pulley may be obtained as an extra. If fitted, this pulley is, of course, handle-bar controlled. The handle-bars are almost straight and give a comfortable racing position. The wheel base of the new T.T. model will be longer than before, and is, in fact, the same as in the standard model; 650×65 tyres are fitted. Both models are fed by 1915 B. and B. carburetters with a top feed to the float chamber. A very neat refinement is in connection with the petrol tank; the gauze filter carries with it a bright metal float, which is usually visible through the glass top, and gives the rider an approximate idea of the amount of petrol remaining in the tank at a glance. Also at night the top of the float can be felt by the finger.



Showing new gear change on left hand side of Rover tank, also dynamo driven by enclosed chain from the countershaft.



The chain-cum-belt driven Rover for next year, which has a new three-speed countershaft gear.

CLUB NEWS.

Motor Union of Ireland (Ulster Centre).

No fewer than fifty members are abroad on active duty; most of them were formerly despatch riders in connection with the Ulster Volunteer Force, and the training they then had is of great use to them now. Amongst the number is G. Boyton, the hon. sec., who was the first private owner to finish in this year's senior T.T. race. The Union is so proud of these riders that the committee has passed a special resolution expressing admiration and commending their patriotism.

Bristol M.C.C. Open Trial.

It has been decided to abandon the proposed exhibition of motor cycles in connection with the eighteen hour trial on the 27th and 28th inst., one reason being that many of the manufacturers would not consent, another, that all the suitable halls in the city have been taken over by the military authorities. A large number of entries have already been received from all parts of the country, and the trial promises to be a success.

277 Standard Pattern Motor Cycles.

The Motor Cycle Buyers' Guide, published in this issue, contains the complete specifications of 277 standard pattern motor cycles on the British market.

Our issue of Thursday, December 10th, will be mainly devoted to equipment.

Petrol Imported during October.

During last month 4,483,162 gallons of motor spirit (value £183,614) were imported into this country. The Board of Trade return has a note, however, to the effect that duty has been paid on 7,210,548 gallons for the same period. In October, 1913, the number of gallons imported were 9,583,070, to a value of £347,742

The Intelligence Corps

On a recent occasion we met Lieut. H. B. C. Pollard, who is about to leave this country on active service, together with six other motor cyclists. These are all good linguists, who will serve with the Intelligence Corps. Lieut. Pollard, besides being well known as a journalist and author, has had considerable military experience, and was in the Balkan Wars.

A Coventry Motor Machine Gun Battery

One of the new motor machine gun batteries which are being formed for attachment to each division of the Army will be composed of motor cyclists recruited from Coventry and district. This battery will be commanded by Major J. E. Alkin, and the Coventry and Warwickshire M.C. has assisted in obtaining the *personnel*.

An Opening for Despatch Riders

More motor cyclists are required by the secretary of the West Lancashire Motor Cyclists' Reserve Committee (Mr. S. W. Phillpott, the North-Western Centre secretary of the Auto Cycle Union) for immediate enlistment. They should apply personally to him at 60, Lime Street, Liverpool, and should present themselves on some motor cycle for examination by the members of the committee. If the machine is a 1913 or 1914 Triumph, Douglas, Rudge-multi, B.S.A., or P. and M., in good order and equipped with a suitable form of variable gear, it may be taken over at a reasonable valuation. Ages 19 to 30. Three years' service with the Royal Engineers' Signal Company, foreign service. Fifty motor cyclists for service with the Royal Naval Motor Squadron are also needed.

Reliability Trial in Australia.

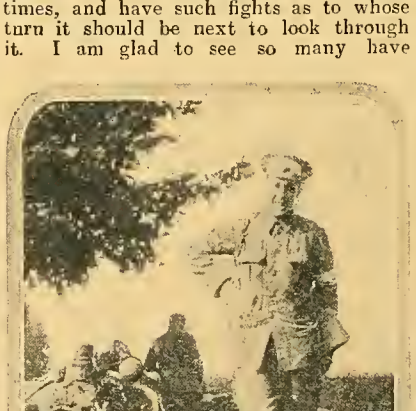
Recent issues of the Australian papers contain accounts of a one-day reliability trial held at the end of September by the Victorian M.C.C. There were sixty-five entries, and these were divided into the following classes: Sidecar combinations, solo machines under 600 c.c., and solo machines over 600 c.c. The distance was 126 miles, starting and finishing from the outskirts of Melbourne.

The Star Performers

The best performance of the day was accomplished by T. K. Hastings, driving a 7 h.p. Indian sc. He was the only competitor to get through without loss of a single mark Other good showings were made by L. Ray (3½ h.p. B.S.A.), winner of the under 600 c.c. class, and R. Jones (6 h.p. Rudge), winner of the over 600 c.c. class.

Experiences at the Front

Corporal G. A. Heath, a motor cyclist despatch rider who has served with the forces since the beginning of the war, writes to say that he has had three motor bicycles. He started with a Rudge-multi (which he had to leave for the Germans), then a B.S.A., and then a Douglas T.T. three-speed, which he found the best for the bad state of the roads. He writes: "I only wish your paper was more easily to be got out here. As a rule there is one between thirteen of us, and many used to read it through two or three times, and have such fights as to whose turn it should be next to look through it. I am glad to see so many have volunteered for such a dangerous game, and think that the Editor of *The Motor Cycle* deserves a good deal of credit for it."



A DESPATCH RIDER AT THE FRONT
Second Lieut. R. G. Larking (a Cambridge boxing Blue)

Certified Trials.

The A.C.U. is attempting to revive certificated trials. At the present time the competition movement is practically dead and manufacturers are, therefore, without that form of advertisement and unable to convince the public of the worth of their new models. The A.C.U., therefore, thinks it desirable to revive this kind of trial by means of which a manufacturer is enabled to have a trial of his own machine carried out under official observation. The scale of charges is being revised, and will be published shortly by the A.C.U.

Comforts for Despatch Riders.

In our Correspondence columns last week there may have been noticed a letter from Mrs. Selwyn, asking for comforts for despatch riders in the 2nd Army Corps. We have also received a letter from a motor cyclist attached to the 1st Army Corps, now at home on leave, who enumerates other comforts which are urgently required—a good electric pocket lamp with a spare bulb and two batteries, a good cigarette lighter in which petrol is used, and a good pair of overalls. Gauntlet gloves are also essential. Generously minded readers might address these parcels direct to "The Moto. Cyclists serving with the 1st Army Corps Headquarters, British Expeditionary Force." Comforts for motor cyclists for the 2nd Army Corps should be addressed to Mrs. Selwyn, 14 Scarsdale Villas, London, W.

Totals of War Funds

The totals of the different war funds enumerated stood as under on Tuesday morning last:

H.R.H. Prince of Wales's National Relief Fund ...	£3,820,000
Indian Soldiers' Fund ...	£86,828
H.R.H. Princess Mary's Fund to provide Christmas Gifts	£75,200
Times Fund for Sick and Wounded	£617,865
The Queen's Work for Women Fund	£89,311
Daily Telegraph Belgian Fund	£64,920

Many New Models in this Issue

Descriptions of a number of entirely new models are included in this issue An outline of the 1915 Triumph, a machine which has been redesigned after ten years' honourable service, the twin cylinder Sunbeam, the novel twin-cylinder two-stroke Premier, four-speed twin P. and M., three-speed Douglas, and 2¼ h.p. B.S.A are among the many 1915 models dealt with.

BUYERS' GUIDE OF 1915 MODELS.

AUTUMN 'MIDST SCOTTISH CRAGS.

DESIGN IN 1915.

La Croix Militaire.

We learn that another motor cyclist has been honoured by the French Government by being awarded the French military medal, namely, Corporal B B. Winter, R.E., who has ridden in several trials this year on a 3½ h.p. Blackburne.

Four Speeds.

Quite a feature of the 1915 models is the fitting of four-speed gear boxes. Now, four speeds are a distinct luxury on powerful machines, but they are much more of a necessity in the case of lightweights. We must not lose sight of the fact that the lower the horse-power the more speeds are required.

Despatch Riders.

The number of military riders to be seen in the S.E. and Kent is surprising, and it points to a good reserve of motor cyclists. At Woolwich, where is the head army stores, there are said to be more new motor cycles than the whole of the London depots can boast of, and enough pedal cycles for an army corps.

A Use for Empty Petrol Cans.

It is of interest to know that a large number of the crew of H.M.S. *Hermes* were saved by the use of empty Shell motor spirit cans, of which there was a large quantity on board. The first torpedo to strike the *Hermes* was aft, where a large quantity of cans were struck and scattered in all directions. The *Hermes* remained afloat after being struck some two hours, but it is quite certain that if it had not been for the empty petrol cans the loss of life would have been far greater, only twenty-three being lost (this included killed and wounded).

Motor Cycles in the German Army.

Most of the machines used by the German Army are, as may be expected, N.S.U.'s, while not a few are Indians. The Deutschers are, also, not above "souveniring" the stocks of British machines held in Berlin.

"On the Never."

Slang in print is generally an abomination, but is sometimes permissible for the sake of clearness. To take a thing from anyone without his permission was called "commandeering" during the South African War. At the present time in England we call it "requisitioning," but those who have come back from the Front call it "souveniring." The French inhabitants are desperately keen on this form of amusement, and everywhere the British troops are met with cries of "Souvenir! Souvenir!" Hence the loss of many regimental buttons, etc., and the adoption of the term.

The Public Schools M.C.C.

Two members of this club who are serving with the Colours are B. C. Barton, in the Artists, and P. C. Douglass, who rides a machine of the same name, and is to drive a car belonging to a major in the Sappers. Douglass has, happily, recovered from a bad accident in which he injured his kneecap, caused by running into a cart last July.

A Motor Cycle in West Africa.

We have received from Mr. H. A. Caulcrick, of Lagos, West Africa, a photograph, which we reproduce, of himself and his 3 h.p. Enfield, and some account of its satisfactory running. One trip, which he mentions as being carried out "none stopped," was from Iddo to Victoria Beach *viâ* Agage Station, Iju Valley, Ikeja, Isheri, Ebutemetta, and Apapa. Between Ikeja and Isheri there are some very steep hills with sharp corners. The ride also necessitates crossing the Mole, and the time occupied

was ninety-five minutes, the average speed being about 31½ m.p.h. Only part of the road was metalled.

A Rover Exponent at the Front.

Dudley H. Noble, who left the Rover Co. at the time of the outbreak of war, and is now in 69th Company, A.S.C., attached to the Indian troops, writes as follows

Sir,—We read *The Motor Cycle* with great interest every week. I have met practically all the members of the "competition riders' clique" out here, and am beginning to wonder if there are any motor cyclists left at home. Practically all makes of machines are represented. I am at present riding a T.T. Rudge. The roads generally are in a very bad state, frightfully cut up in the country, and the greasy *pavé* of the towns is unspeakable. By the way, mem. for accessory manufacturers: does the International Military Trial come under the bonus scheme? Having a pretty good time, but the weather is getting bad now.

D. H. Noble.

The Design of 1915 Model Motor Cycles.

The following analysis of features of the 277 standard pattern motor cycles included in *The Motor Cycle* Buyers' Guide, published in another part of this issue, forms interesting reading:

ENGINES.		
Single	... ...	117 = 42.2%
Twin	... ...	95 = 34.3%
Two-stroke	... ...	65 = 23.5%
TRANSMISSION		
Belt	... ...	135 = 48.7%
Combination	... ...	72 = 26%
Chain	... ...	64 = 23.1%
Shaft	... ...	6 = 2.2%
LUBRICATION.		
Hand or drip	... ...	229 = 83.3%
Mechanical	... ...	26 = 9.7%
Petroil	... ...	22 = 8%
OTHER DETAILS.		
Countershaft gears	...	151 (+ 20 in footnotes)
Automatic carburetters		16
Three-speed gears	...	121 (counting footnotes)

Sheffield motor cyclist special constables, who are guarding the local waterworks and railway tunnels. The photograph was taken last Sunday on Owler Bar Moors after the first fall of snow this autumn. The machines are a Lea-Francis and a Matchless.

More Despatch Riders' Experiences.

BY the courtesy of Dr. Rice, of Allesley, near Coventry, we are able to give extracts from another interesting letter received from one of his two sons who are serving as despatch riders with the British Expeditionary Force. He writes :

"On our way here we stopped at a large village called L———, where we found everything going on as in times of peace, excepting the fact that all able-bodied men had left for the war. We were awfully interested, because every other village we had stopped in hitherto had either been wrecked by the Germans or deserted by the inhabitants.

"This particular village was most enthusiastic on our arrival. Our colonel arrived there and made arrangements for parking the column and billeting the officers early in the afternoon. Eddy and I were the next to arrive. We were supposed to be motor cycle orderlies in attendance on the colonel, but owing to a breakdown of one of our machines, which by its nature necessitated both of us staying behind to effect the repair, we lost sight of the chief's car, and taking a wrong turning found ourselves some ten miles out of our way, with the result that we did not arrive until after dark. We stopped in a little square, and enquired from Monsieur le Colonel Anglais. In a few minutes thirty or forty very talkative people of both sexes (both sexes, mark you, and very nice, too) had collected round us, so that by the time the worthy mayor arrived we had quite a crowd. This worthy produced a tiny *mouchoir*, and blew the biggest nose I have ever seen, after which ceremony he led us up the village street to a jolly little house where the colonel had taken up his quarters. The whole crowd followed, and we felt most important.

Stomach Before Mass.

"We then returned to the entrance of the village to guide the column to its moorings on its arrival. While waiting we made friends with some good people who owned a little grocery stores. They were most kind to us, and offered to put us up during our stay. And so, after completing our duties, we returned to our friendly grocer and spent the first night in a civvy bed since our enlistment early in August. I awoke the next morning to the clang of a church bell summoning the people to Mass. The whole place turned out, and so did I, only I felt the needs of the flesh the more pressing, so departed for breakfast at the lorry camp.

"While in this village we learned a good deal of the inward side of French village life, which was very interesting. We were the first soldiers the people had seen in these parts. Indeed, on our journey to L——, Eddie and I, on arriving in a tiny out-of-the-way village, were just in time to see the people scurry away and lock themselves in their houses.

"They took us for Germans, or motor cycling Uhlans perhaps! Anyhow we pulled up in the street and roared with laughter to such an extent that many came out to learn the joke, and were much relieved to hear we were out for King George and not Guillaume. After drinking many toasts to Merry England and La Belle France, and promising to *couper la gorge à Guillaume*, we proceeded on our way with required directions as to our route.

A German Aeroplane Drops Bombs.

"It was while the column was stationed at L——— that I was lucky enough to have an experience I wouldn't have missed for anything, and that was bomb dropping from an aeroplane. I was at General Headquarters with a message, talking outside in the street with the other motor cyclists when we heard that curious swishing sound made by an approaching shell, which instantly increases in volume and seems to fill the whole air. A moment later there was a violent explosion, accompanied by the high pitched scream of shrapnel, a shower of broken glass and brick dust. Two more bombs followed in quick succession, all three falling some forty or fifty yards away from the headquarters building, which happened to be a nunnery in a town. A slight droning sound was audible overhead, and we recognised an aeroplane of the Taube type of German machine. Two of our machines rose inside three minutes from the aerodrome beside the town, and set off in pursuit, pouring a hail of lead into the intruder, but seemingly without effect. The report was circulated the next day that the French brought the German down some ten miles away, but it was never confirmed officially. The total damage amounted to two women killed, a tiny girl wounded, and an old man's hand blown off. Two days ago they had a shot at our column but missed it by 400 yards. They were flying amongst the clouds.

"I was out with a brigade ammunition column the other day, and a machine came overhead directing gun fire. I had a few shots at it but missed, so a few minutes later we had some big shells over from Jack Johnson and his brother, the two German big guns. I had an idea the colonel wanted me, so cleared out! Shortly after the ammunition column found the district over exciting and moved round a bit, too!

Military Value of the Aeroplane.

"This war is essentially an aeroplane triumph. During a battle machines patrol the front, keeping hawk-like eyes on the enemy, watching their movements, and directing our gunfire by signals. Without them the artillery people would be sadly hampered. The general idea seems to be that we shall shortly force the enemy back into his own country, and that our armies will then sit outside and batten at his doors until the Spring, when another determined and general advance may be expected.

"Since the village of L——— we have moved on a good way, and arrived at another village which the enemy have evacuated. The people on all sides curse the Germans for barbarians, and say their behaviour was intolerable. They ill-treated everyone, especially the women, treating them in a manner too revolting for words. The shops in the neighbouring market town they pillaged wantonly, scattering the goods all over the place, ripping open packages and throwing them down. Rapine, pillage, and murder everywhere. They even buried an R.C. priest alive who endeavoured to intercede on behalf of some of the young girls! This is the civilised enemy with whom we have to deal. They have respect for nothing. Treaties, women, children, Red Cross, white flag, nothing. The people here are right; they are utter barbarians. I only hope we shall not make peace until the cursed name of Germany is wiped out. Never will the French here forget them, their hatred is such that we cannot understand. I saw a body of 400 prisoners marched through the town near by only the other day, and really for the moment it looked as though the people would try and lynch them. Had it not been for the strong escort of our men, doubtless they would have had a go at them.

"We have seen a good many Indian troops about lately; they are truly magnificent looking fellows. They sit their horses with an easy grace that I envy muchly. To cling on for dear life is all that can be managed on a motor bicycle with these roads! The Indians' uniform makes us look shabby in comparison. Somehow they have an extra neat appearance which is enhanced by the turban and their Oriental bearing. The people are awfully pleased with them.

"Tell people who ask that we can always get rid of warm extra clothing among the men, like gloves, mufflers, woollen caps, etc. Cigarettes, chocolates (preferably in small pieces), soup squares, are amongst our most immediate wants.

"If I write any more I shall not have the face to ask the captain to censor it all."

BERNARD.

AN UNFORTUNATE COLLISION.

Eddie Rice, brother of the writer of the above, has, we regret to state, met with an accident, as his latest letter shows. The collision occurred at 7 p.m. in a narrow and greasy lane. It was moonlight, and neither car nor cycle had lights.

"I am temporarily out of action," he writes, "due to a collision at a somewhat reckless speed with a motor car; both of us were trying to get back before dark. I rode full pelt into the front wheel of the car and then did a little aeroplaning, after which I found myself in a ditch with my leg broken and the motor cycle engine lying in pieces all over the road. The front tyre of the car was burst and the front axle shifted back about a foot. We sought an ambulance, which I was glad to find, because both bones are broken. The doctor thinks I may be able to ride again in about eight weeks, so I may be home for Christmas.

"I shall not be leaving here (Boulogne) for another week owing to bruises, etc., making travelling painful. When I do leave I hope to be drafted off to the Coventry Hospital if possible. Bernard was very happy when I last saw him; he has fixed up a billet in a grocer's shop, where he will sleep until they advance again, which will not be for some time. I wonder where they will be when I rejoin him! Pretty near Germany I hope."

EDDIE.

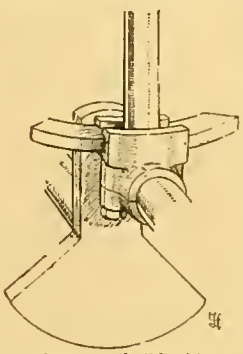
A PREMIER INNOVATION.

Novel Design of Twin-cylinder Two-stroke.

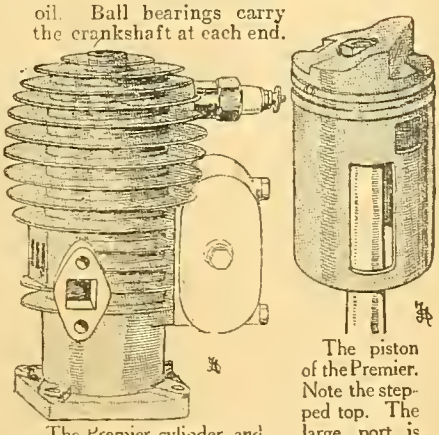
FOR some time past there have been rumours of a twin two-stroke to be produced by the Premier Cycle Co., of Coventry, but, though we were permitted to have a private view of the experimental model some months ago, it was not until this week that we have been able to give preliminary details of what is likely to prove the most startling novelty of the year. The new Premier is unorthodox in almost every feature, but this must not lead readers to think that it is untried, for it has undergone prolonged tests with the most satisfactory results, and the design, though unusual, is clever, and may lead to striking results in the near future.

A Very Novel Engine.

The engine is a twin vertical two-stroke, with the crankshaft set longitudinally in the frame. It has a capacity of 322 c.c. (bore and stroke 64×50 mm.) There are no connecting rods in the usual sense of the term, but vertical piston rods working in long guides are fixed solidly to the piston head. At the base of these rods a flat foot is formed, and set on a radius. The foot is carried in a white metal T-section guide formed solid with the top half of the split big end bearing. Thus, when the crank is rotated, the piston rod moves vertically, while the curve of the plate or foot imparts a slight rotary action to both rod and piston. This action is utilised to open and close the ports for the various processes of suction, transfer, and exhaust. The space between the piston walls and piston rod guide is filled by an aluminium casting, and the inlet port draws gas from an automatic carburetter during almost the whole of the upstroke of the piston, instead of for the short period when the piston nears the top, as in most two-strokes. On the piston descending, the induced gas is compressed in a cast aluminium receiver bolted to the cylinder, and thence is transferred to the combustion space *viâ* the cylinder head and baffle plate. The piston head is stepped on both sides of the baffle, the steps being arranged so as to make full use of the rotary movement of the piston. At the back of the balanced crankshaft lies a plunger pump, which forces oil from a sump in the crank case through the crankshaft to the big ends and piston rod slides, the oil passing through the centre of the pump plunger into the crankshaft. The guides and pistons are amply lubricated by splash, as the suction below the piston helps to raise the oil. Ball bearings carry the crankshaft at each end.



Piston rod slide, big end, and part of balanced crankshaft.



The Premier cylinder and receiver. The square port is the inlet from the carburetter. The exhaust ports can just be seen at the left.

The piston of the Premier. Note the stepped top. The large port is from the carburetter; the smaller to the receiver.

The Gear Box and Transmission.

Directly behind the crank case lies a pair of skew gears which drive the main gearshaft at right angles to the crankshaft. The three-speed gear has all its pinions constantly in mesh, and each gear is locked to the shaft as required by a central wedge bar, which expands balls against the inner face of the gear wheels in a similar manner to the well tried lathe gear. The final drive is by belt.

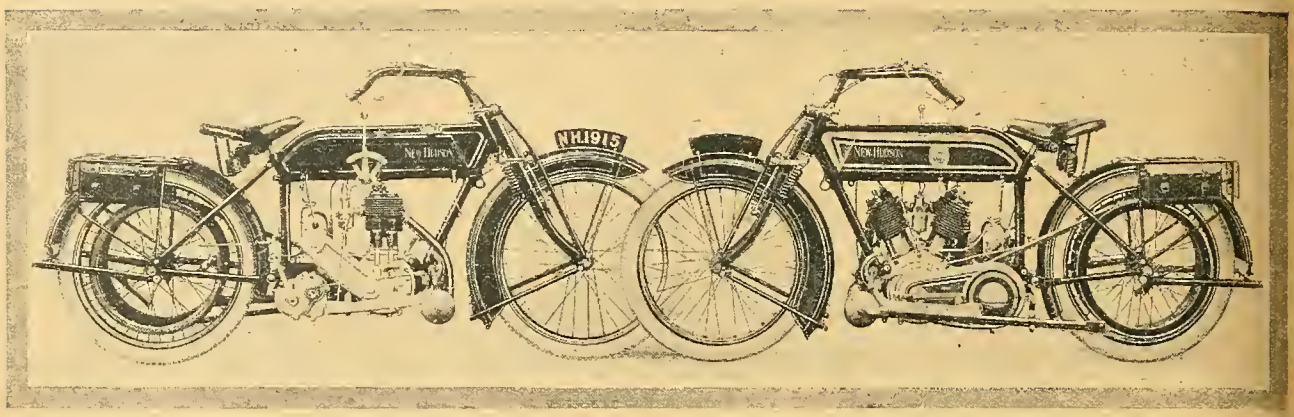
Even the frame is unusual, for all the head and saddle tube lugs for the duplex frame are cast with two circular bodies, which form the front and back ends of the combined tank and top frame tubes the two ends being brazed to a large diameter steel tube.

Both brakes are of the internal expanding type and lie side by side in the rear hub, the hubs themselves being mounted on journal ball bearings. The equipment is full and on standard lines, and it is likely that one model will be turned out in a biscuit colour with no plated parts, which gives an extremely smart finish. Incidentally, one of the latest 3½ machines finished as above was shown to us.

PREMIER TWO-STROKE.
Combined tank and frame tube, showing how lugs are cast with the tank ends.

The standard models have undergone but little alteration. Both 3½ and 7 h.p. will be fitted with twin internal expanding brakes, and the 7 h.p. has steel flywheels stamped from the solid with the crankshaft. Special attention has been given to the prevention of oil leakage.

NEW HUDSON 1915 PROGRAMME.



The 3½ h.p. New Hudson, with countershaft gear and kick starter.

Belt side of the 6 h.p. New Hudson three-speed countershaft geared model.

CONTRARY to the more usual practice of presenting next year's models early in November, the makers of the New Hudson machines have been working on their new models for some months past, the result being that they are now delivering them in quantities, though, with characteristic enterprise, the managers have made sundry alterations and improvements as experience dictated.

In view of the present popularity of two-stroke lightweights, we will first of all turn our attention to the New Hudson of this type. It is a single-cylinder machine of 2¼ h.p., the cylinder dimensions being 62 mm. × 70 mm., giving a cubic capacity of 211 c.c. It may be obtained either with a single gear or else a two-speed countershaft gear. A cheaper pattern has footrests only, but the standard has aluminium footboards, curved upwards at the front to protect the toes. There are several variations of the New Hudson two-stroke; in all the engine and main features are the same. The prices range from £27 5s. to £37 10s., including usual equipment. 24in. × 2in. tyres are fitted to all models.

The next machine on the 1915 New Hudson programme is the "military service" model, as it is called by the makers. It is specially designed for hard work under trying conditions; the frame, engine—in fact, every part is of unusual strength. Accessibility has been very carefully studied, also the question of standardisation, and the quick and easy replacement of spare parts—two important points on a machine intended for military work.

The engine is a single-cylinder 85 mm. × 88 mm. (499 c.c.), rated at 3½-4 h.p. The drive is by Renold chain to a three-speed countershaft gear, and thence by belt. The magneto is chain-driven, and is placed behind the cylinder in an accessible position

Two gallons of petrol is the capacity of the tank. This is a very desirable feature, because it would be an easy matter to run out of fuel when effecting a reconnaissance or carrying despatches. On such jaunts one never knows when the next opportunity will occur for taking in supplies for machine and man.

It is enamelled service grey and black, and with full equipment and three-speed gear, the price is £57 10s.

The third New Hudson model has a name with a distinctly American flavour, it being known as the "Master Model Big Six." The New Hudson twin-cylinder is designed as a passenger machine, and the engine is of 770 c.c., the cylinder dimensions being 76 mm. × 85 mm., set at an angle of 50°. Of course, the New Hudson three-speed gear is fitted, the ratios being 4⅜, 7½, and 15 to 1 respectively. In this connection it is interesting to recall the fact that the New Hudson Cycle Co. were one of the first firms to fit, as standard, three-speed gears to motor cycles. The gear is of the sliding type, and placed on the bottom bracket, the drive being by chain from the engine and by belt from the countershaft. The kick starter is neatly embodied with the gear box.

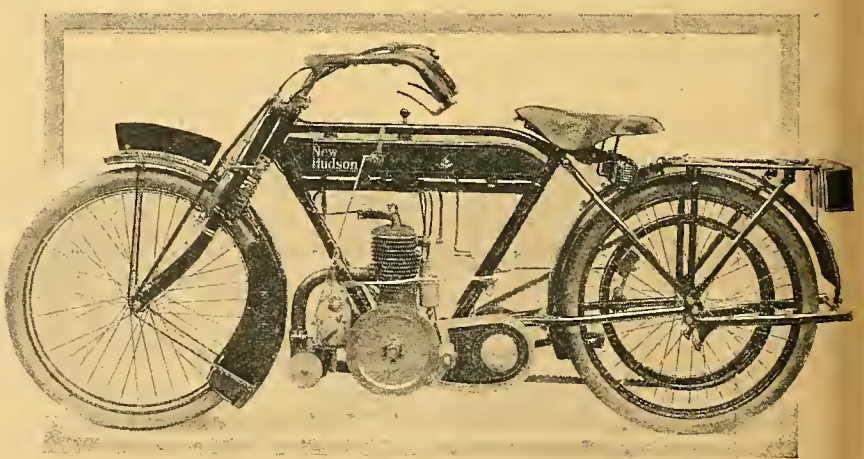
650 × 65 voiturette tyres are fitted, the mudguarding, footboards, toolbags, and general equipment are what one would expect with a machine emerging from a factory with the experience of the New Hudson.

AN IXION TWO-STROKE SIDECAR OUTFIT.

ONE of the most striking proofs of the efficiency of the modern medium weight machine is instanced by the fact that the Ixion Motor Co. has decided to market a complete sidecar outfit propelled by a 2¾ h.p. Peco engine of 349 c.c.

The whole machine is beautifully proportioned to the engine, and, though light, is fully strong enough for the work required. The engine has a direct belt drive to a Sturmey-Archer three-speed hub. A kick or handle starter is provided. The sidecar chassis is very neat and strong, and no adjustments are used, as the passenger carrying portion has wisely been designed expressly for the light motor cycle. Consequently, it is possible to arrange fixings in standard positions, which, besides being neat and light, greatly facilitates attachment. We have seen the sidecar attached in a few moments, and the fixings are quite positive.

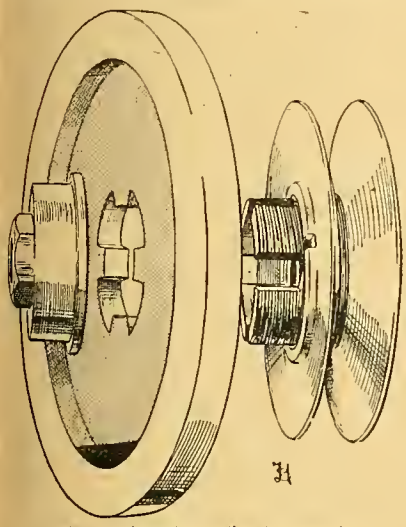
All the fittings and the finish are well carried out, and the outfit has a most pleasing appearance.



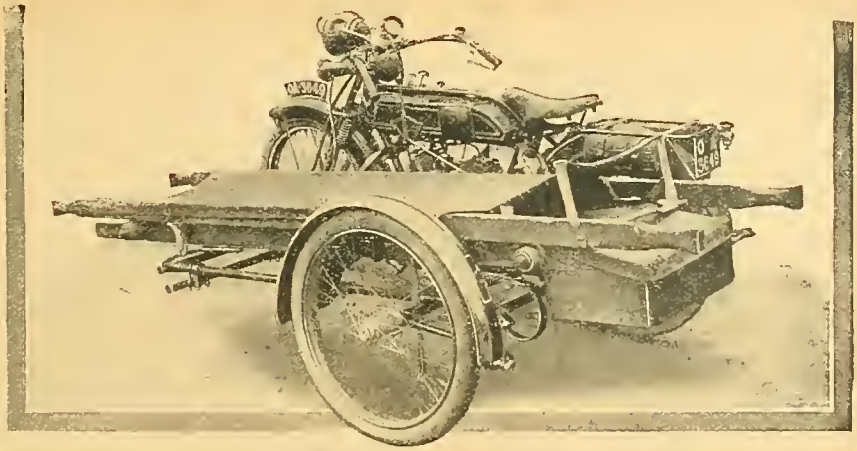
Latest specimen of the 2¼ h.p. two-stroke two-speed New Hudson.

AN ADJUSTABLE PULLEY FOR OUTSIDE FLYWHEELS.

With a few notable exceptions motor cycles which employ outside flywheels are without any form of adjustable pulley, and it is with the object of improving on this state of affairs that Mr. B. F. Plant, of 138, Wolverhampton Road, Walsall, has provisionally protected the device which we illustrate. The main body of the pulley is keyed to the crankshaft in the usual manner. This main part consists of a pulley flange with a long extension. One portion of the extension is screwed left-handed, and carries the second or adjusting flange, while the end is accurately slotted to fit dogs formed in the centre of the flywheel. A lock-nut with a spring catch holds the parts in position and finishes off the device neatly. The face of the adjusting flange is fitted with a slot corresponding to a stop on the inner face of the flywheel, to prevent the unscrewing action when starting up. An alternative design has the flywheel and one pulley flange cast in one, the adjusting flange being that nearest the crank case. In this case a spring between the flanges holds the loose flange up to a locking device. It may be added that a pulley which will provide ratios variable from the saddle is being constructed on these lines.



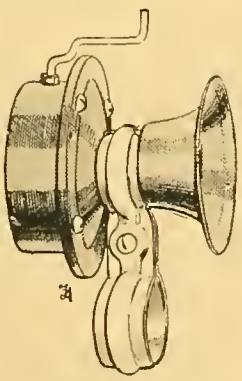
Plant's adjustable pulley for outside flywheel engines.



A sidecar ambulance by Messrs. Mead and Deakin, makers of the Canoelet sidecar. A broad Red Cross is painted on the sidecar mudguard. The machine is attached to a 6 h.p. New-Hudson.

A TINY MECHANICAL HORN.

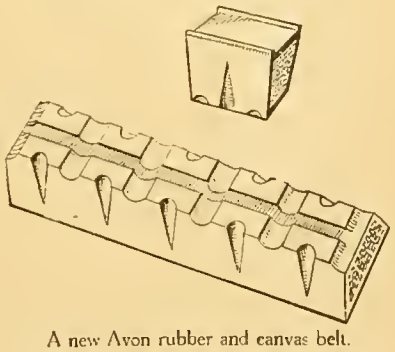
We illustrate herewith an exceedingly neat little mechanical horn which is highly suitable for light weight machines. It is sold by Messrs. Brown Bros., Ltd., is known as the Byk-electric Buzza, and emits a sound somewhat similar to the Klaxon, though, of course, not so loud. It is operated by the small handle shown on top. The price is 3s 6d.



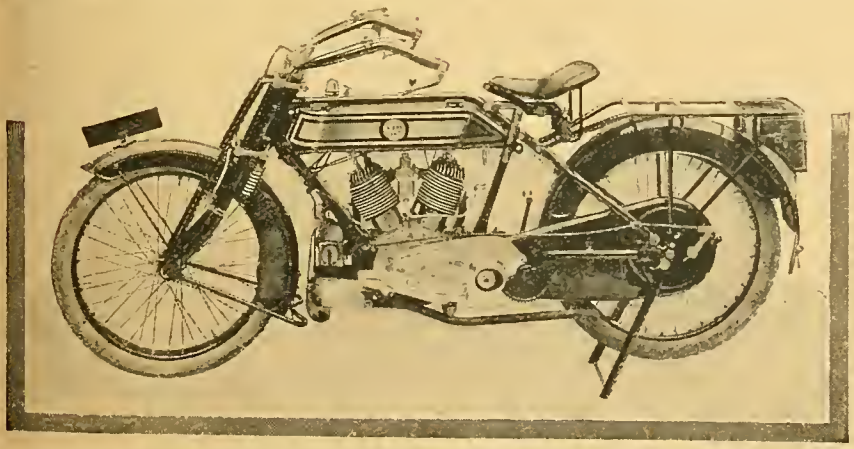
A suitable warning device for a lightweight sold by Brown Bros., Ltd. Its screeching note can be guaranteed to attract attention.

THE AVON BELT.

The new Avon belt, which we illustrate, has some novel features. In the first place it is provided with a watershed top, the object of which is to throw off rain in front instead of allowing it to run down the sides of the belt and cause slipping. Then, in addition to the transverse grooves which are found on most rubber belts, there is a longitudinal channel running along the centre and vertical grooves narrowing to a point near the outside of the belt, the object of this arrangement being to cause the belt to retain its proper angle of 28° when it is bent round a pulley. We are informed that this belt has been put to searching tests with most satisfactory results, belt slip being reduced considerably.



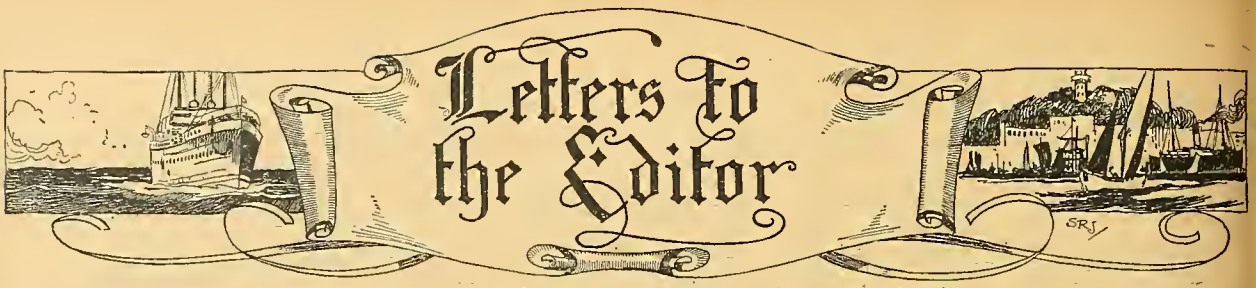
A new Avon rubber and canvas belt.



An 8 h.p. Rex-Jap special Colonial model, the features of which are 28 x 3in wheels, and 5½in crank case clearance.

REX-J.A.P. COLONIAL MODEL.

The Premier Motor Co., Aston Road, Birmingham, has constructed a most substantial Colonial model. The crank case clearance is no less than 5½in. and 28in. wheels shod with 3in. tyres are fitted. The spokes, hubs, and other parts are finished black, the object being to reduce the number of plated parts to a minimum. Quick detachable chain cases with each segment made interchangeable are supplied. The kick starter is contained in an extension of the gear box, which is of the countershaft type, and the gear lever is provided with a gate change having a positive stop for each position. Altogether this seems to be a most suitable machine for Overseas requirements.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Petroil Lubrication.

Sir,—As a rider of a two-stroke since last April, I admire the simplicity of petroil, but do not consider it ideal or likely to last any length of time. No doubt it lubricates well, but it seems to lubricate the piston much better than the big end, and it leaves the carburetter and adjoining parts in a messy condition, which collects all the dust of the road. My experience has been the same as Mr. Hampton. Recently finding a considerable loss of power and speed on hills, I had my Connaught examined. The top piston ring was completely carbonised in its groove, the others slightly affected, but there was no carbon deposit to speak of anywhere else. H.L.L.

Why an Engine Konks.

Sir,—I was extremely interested in the article by Mr. Watchorn entitled "Why an Engine Konks." The theory advanced, however, "that the piston is blown across the cylinder," is distinctly novel; and according to Mr. Watchorn's diagram, etc., a pressure of about 300 lb. is travelling from the direction of the sparking plug towards the piston, which results in it being pushed sideways. That the combustion "commences" there is right enough, but the *resultant* "*pressure*" is uniform throughout the cylinder head, otherwise, according to Mr. Watchorn's theory, we should need the valve chamber which carries the sparking plug to be several times stronger than the other parts of the head, which is, of course, quite contrary to modern practice. If there is a pressure of 300 lb in the cylinder, then the pressure is obviously equally distributed over the whole of the exposed area of the piston, and if Mr. Watchorn's theory is correct, he has only to place the plug in the cylinder head instead of the valve cap to avoid the "konking" referred to. There are many factors which determine the musical abilities of an engine far more than the position of the valves, a few of which are 1, compression ratio; 2, length of connecting rod; 3, length of piston; 4, position of small end pin; 5, design of cylinder head; 6, carburation; 7, lubrication; 8, piston clearance, etc.; and also the fuel employed. It is therefore extremely difficult to lay down any hard and fast rule for the novice as to why an engine konks. I might add regarding overhead valve engines that I have usually found them more prone to konk than the T or F type, and they usually also show a somewhat higher efficiency.

ERNEST P. EVEREST.

Sir,—I agree with Dr. Low that my article on konking was too brief and the sins of omission were numerous, but, as the editor only allowed me space for an article of 250 words, I did the best I could.

My article might have been better headed, "Why are certain types of engines subject to konking while other types are practically immune," and the theory given is, as far as I know, the only one which gives a reasonable explanation agreeable with practice.

Now, it is an admitted fact that an engine without side pockets and with an hemispherical head will run much longer without konking than an engine with side pockets.

Several instances have been given; for instance, in *The Autocar* one case of such an engine in a London 'bus running 29,000 miles without lifting. The racing Peugeot engine, which set the fashion to the motor racing world, is said to be free from konking. This engine, as is well known, has no pockets and a hemispherical head. It is also a fact that any engine with side pockets, whether such pockets are in a line with the crankshaft or at right angles or on opposite sides of the cylinder, will start konking after running less than half the distance that a pocketless hemispherical headed cylinder will run.

Now, why is this? The reason is fully explained by the theory of a pocket blast across the piston top.

In the Editorial of November 5th, the point is raised that the theory given does not cover an engine with pockets at right angles to the crankshaft.

May I say that the theory given covers any type of pocket engine. In the case of the engine mentioned it simply means that, instead of the piston being blown from one side of the cylinder to the other, it is only blown from one corner to another corner, or, in other words, blown half the distance, as in the case mentioned in my article: this is one of my sins of omission.

I cannot understand Dr. Low in his statement that it is impossible to classify the different types of knocking heard from a faulty running engine, for, in the first place, the internal combustion engine was invented over a hundred years ago. For the last fifty years it has been made commercially, or, in other words, more than one generation of engineers have assisted and simplified the design; consequently, there is no beautiful mystery about it and very little research work left

Furthermore, any competent gas engine fitter can tell at once on a faulty engine of a design he knows, what is wrong by the class of sound given out. The noise may cover a dozen different causes, ranging from, say, a broken ring to a loose key in the flywheel.

I should like to know whether Dr. Low has experimented with an engine with pockets reversed as mentioned, as it is not definitely stated. I should be very interested in the results. In regard to evidence that a piston can be blown across a cylinder, notwithstanding there is no exit on the opposite side, I can give an example of the old pattern horizontal gas engine which fired below the centre. On examining this engine for repairs it will always be noticed that the cylinders have worn the most at the top, which certainly could not happen except by the piston being blown up to the top of the cylinder by the first rush of the charge. This fact is common knowledge to any gas engineer.

Messrs. Lodge Bros. think that the theory given is upset in the case of a T-headed cylinder firing simultaneously in both pockets. They have forgotten that different mixtures of gas fire at different velocities. We all know that a plug will fire better over an inlet than over an exhaust valve, for the simple reason that the gas is purer and not diluted so much by the exhaust gases.

It is, therefore, evident that, although the firing takes place simultaneously owing to the fact that the gas over the inlet valve is fresher, it will fire first and have the piston across before the exhaust side has fully ignited.

E. WATCHORN.

Sir,—I have read with great interest your leaderette and Mr. E. Watchorn's contribution on the subject of "Why an Engine Konks," but I fear I disagree with some of your contributor's theories, and beg to submit a few of my own. I do not think the design of the combustion head or the situation of the sparking plug has anything to do with the matter. The noise is undoubtedly due to the piston changing sides, that is, leaving the front and making sudden contact with the back of the cylinder, not "blown" across as Mr.

Watchorn suggests, but violently *thrust* across by the angularity of the connecting rod, acting through the excess of pressure upon the piston, *in proportion to the speed and position it has acquired in commencing its descent.*

Let us remember that angularity of thrust commences immediately the crank pin passes the dead centre, angularity being quite considerable by the time a downward movement of the piston is noticeable. It should be noted that the lighter bottom portion of the piston will be the first influenced by the thrust, and so make the lighter and more silent contact with the cylinder wall, the heavy top being then "speeded up" by semi-rotation about the centre formed by the bottom of the piston against the cylinder. It will also be granted that a certain amount of time is occupied in the transit of the piston from one side of the cylinder to the other, and, short, indeed, though the time must be, the angularity of the connecting rod is constantly increasing during that time, simultaneously building up the "cross momentum" of the piston, all this taking place while the piston is in one of the slowest sections of its downward journey, if I may be excused for using the term, "almost stationary" so far as its power-developing motion is concerned; with the result that the heavy top of the piston strikes the cylinder wall a hard, unsmeared blow.

Retard the ignition and the maximum pressure of the explosion is reached only after the piston is further on its journey and travelling at greater speed, with the result that the blow is "smeared" and deadened. Konking occurs only at comparatively low engine speeds. Speed up the engine by taking off the load, or by changing to a lower gear, and the konking ceases, the increased piston speed having the same effect as retarding the ignition, namely, that of correcting the moment of maximum pressure upon the piston. A clean engine will konk if it can be persuaded to get hot enough, the heat raising the compression pressure by expansion and more perfectly vaporising the fuel, thereby rendering the charge more rapidly permeable by combustion.

E. GASSTON, JUN.

Sir,—The sudden impact of the exploded compressed charge of gas gives rise to a certain amount of noise in any engine firing normally, more or less proportionate to the suddenness of the impact which is due to the resistance to the expansion of the gas, which resistance is itself relative to the piston speed.

This noise is no more to be confused with exhaust noise than the kick of a rifle is to be confused with the sound of the shot. And the noise is set up chiefly by the piston head, but is also helped by vibrations from the valve heads and engine head generally.

If then the impact of the sudden expansion should meet a rising instead of a falling piston, the impact will be tremendously greater, and, consequently, the vibrations set up will be much more audible, and the quality and intensity of the sound will vary also according to the freedom which these parts have and vibrate (*e.g.*, loose bearings), and to the quality of the metal—a tuning fork vibrates much better than a bar of cast iron.

If an engine be running normally this noise is scarcely, if at all, audible; but if the engine be overworked, and, as a natural consequence, become too hot, another factor comes into play, which tends to turn a normal firing point to one which is so far advanced as to cause premature firing. That factor is the rapidity of the combustion and consequent expansion of the gas.

Every servant girl knows that hot sticks will kindle up much quicker than cold, and so with the compressed explosive mixture. The hotter the mixture the quicker it burns, and, therefore, unless the ignition be retarded, the piston receives the force of the explosion before it has passed dead centre, and the impact gives rise to the "konk." Of course, a mixture of perfect proportions burns faster than one which is too rich in petrol.

Further, when the interior of the combustion chamber becomes covered with "carbon," as has been stated, pre-ignition by a glowing carbon point sometimes occurs, this, of course, being helped enormously by the already too hot charge. But what is a much more important matter is that this coating of ashes, being a poor conductor of heat, renders the interior of the combustion chamber a much hotter place than it should be, so that the compressed charge may even ignite by "spontaneous combustion" due to the heating which it receives from the inner layer of the carbon deposit.

That some engines should be more liable to konk than others must be due, in addition to what has been stated *re* quality of the metal, etc., to their powers of radiating the heat generated, and their powers of heating up the compressed charge. Thus, other things being equal, a T or Γ shaped combustion chamber would be more prone to this fault than a spherical shaped chamber, because in the former the compressed charge has a greater area of contact with the walls of the chamber, and, consequently, is heated more quickly. And, certainly, as Mr. Watchorn states, a glancing blow on the piston head would be likely to set up more vibration in that piston than a perpendicular blow.

J. D. M.

A Timid Tip.

Sir,—"Ixion" makes a suggestion that, in the case of the Norton at any rate, comes years late. Our petrol pipe is fitted vertically underneath the petrol filler hole, and a lock-nut is screwed on to an internal extension of the petrol tap stud precisely as suggested.

NORTON MOTORS, LTD.

Gear Slip on an Old Machine.

Sir,—Can you kindly spare me an inch of space in which to thank correspondents who took so much trouble to try and help me out of my difficulty of high gear slip on P. and M.? I am specially grateful to Benjamin Newbery, who hit the nail right on the head.

As he advised, I removed operating chains and replaced them in a different position, when any excessive slip disappeared at once. It is a bit of a puzzle why this is so, but I hope it will continue. If so, I no longer need sign myself

B 10.

Removing Douglas Cylinder.

Sir,—With reference to Mr. Hughes's remarks on removing the front cylinder of a Douglas by the use of the slot in the frame lug, I came to the conclusion some time ago that it was not worth doing, unless pressed for time, as the complete removal of the engine from the frame entails very little more work, namely, removal of driving chain and left handle-bar controls.

The disadvantages of leaving the crank case on the frame are: (*a.*) The lower cylinder nuts are almost inaccessible. (*b.*) There is more chance of damaging the pistons.

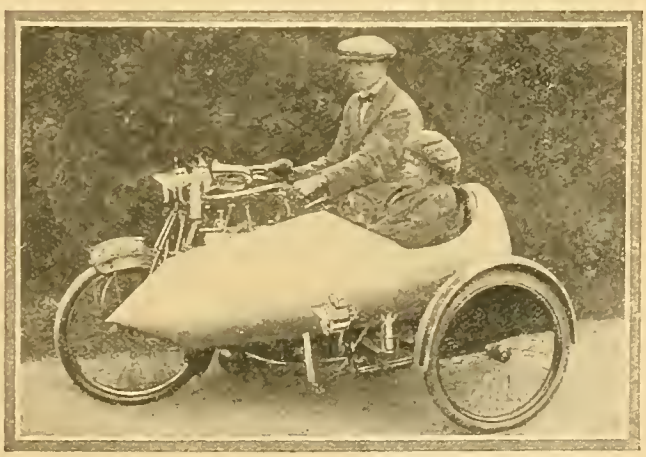
The complete removal appeals to me as sounder engineering practice, and offers better opportunity of cleaning the underside of the crank case, and of cleaning and inspecting the bottom frame tube.

R. E. BARTON.

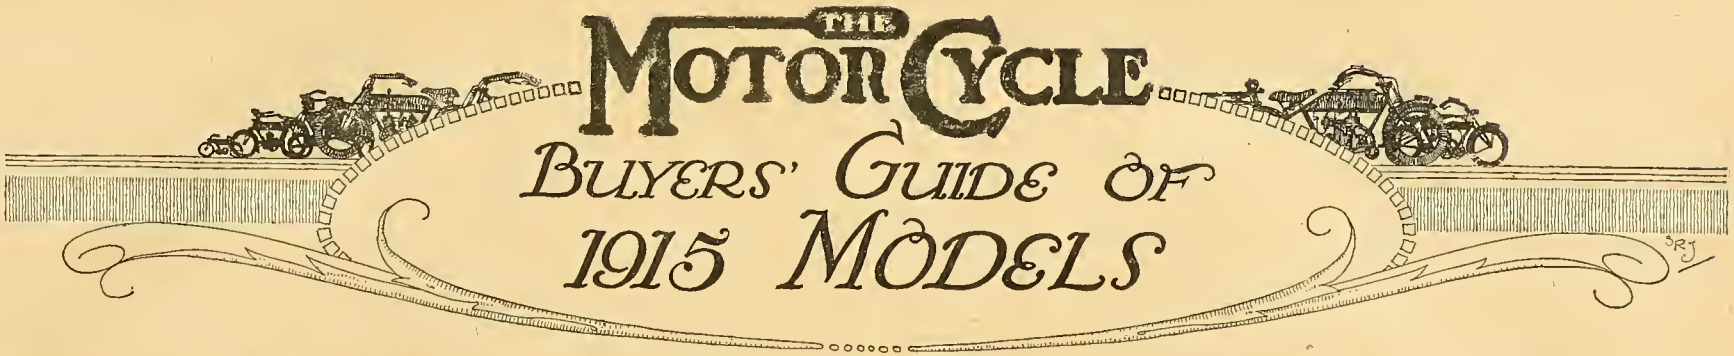
A Sheet-iron Sidecar

Sir,—I thought this photograph of my novel sidecar might interest you. It is made of sheet-iron, upholstered in leather, and is extremely light, weighing under 36 lb. It was made for me by a person who has never made a sidecar body before.

B. P. FOWLEY



B. P. Fowley who writes respecting the sheet iron sidecar shown in the photograph.



COMPLETE SPECIFICATIONS OF MOTOR CYCLES OF ALL TYPES ON THE BRITISH MARKET.

This year in particular the Annual Buyers' Guide of "THE MOTOR CYCLE" fills an important breach, for, in the absence of the Show due to the regrettable European conflict, such a work of reference becomes of treble value to actual and prospective motor cyclists, agents, and manufacturers alike. The Guide was first published in 1906, and ever since has proved its usefulness, and is regularly filed for future reference by all connected with the industry. In order to follow the details more conveniently, the reader should lay a straight edge or sheet of folded paper on the page. For ease of reference the Guide this year is divided under three headings—

(1.) TWO-STROKE BICYCLES. (2.) SINGLE-CYLINDER FOUR-STROKE BICYCLES. (3.) MULTI-CYLINDER FOUR-STROKE BICYCLES.

In certain instances details are missing, due to the new models not being actually ready for the market. The whole of the mass of information has been provided by the manufacturers, and whilst every effort has been made to avoid inaccuracies, we cannot be held responsible for any errors which may have crept into the Guide.

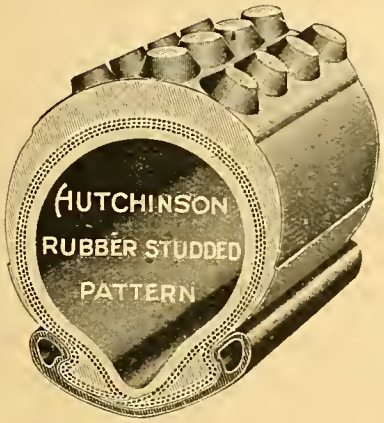
HUTCHINSON

MOTOR CYCLE TYRES.



THE Hutchinson Rubber Studded and the Hutchinson Three Ribbed will be our two leading patterns for 1915.

THE Governments of the Allied Armies require a great portion of our supplies, but in spite of this, and the fact that 2,012 of our staff are fighting in the Allied Armies, we are able to announce

REDUCED PRICES FOR 1915

and can promise

SUPPLIES AS USUAL.

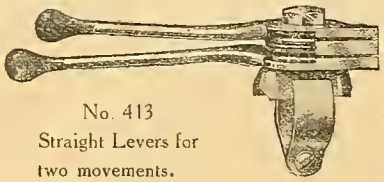
Quality has, of course, been maintained.

HUTCHINSON TYRE CO., 70, Basinghall Street, LONDON, E.C.

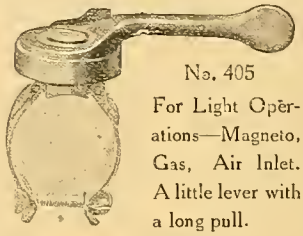
In answering this advertisement it is desirable to mention "The Motor Cycle." B21

Control Levers for Bowden Wire

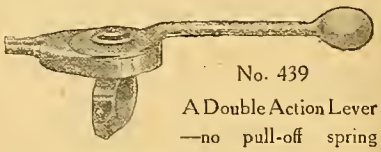
YOU have absolutely complete control of all vital movements at your finger tips if you adopt the Bowden Wire Control System. Bowden Control Levers are made in great variety—as you will see from a few of the types here illustrated. Our catalogue contains particulars of many others. Write for a copy to-day. Prices quoted are for levers only.



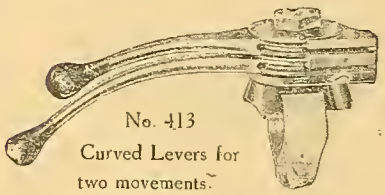
No. 413
Straight Levers for two movements.
7/6



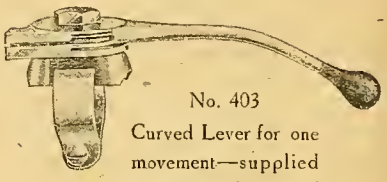
No. 405
For Light Operations—Magneto, Gas, Air Inlet. A little lever with a long pull.
5/-



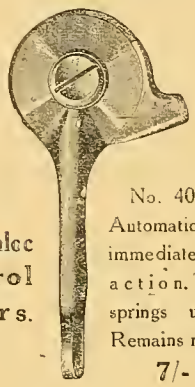
No. 439
A Double Action Lever —no pull-off spring required—suitable for Spark Advance, Throttle, etc.
6/-



No. 413
Curved Levers for two movements.
7/6

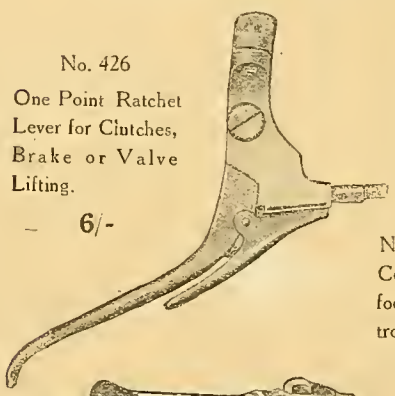


No. 403
Curved Lever for one movement—supplied with pin fitting if required.
5/-

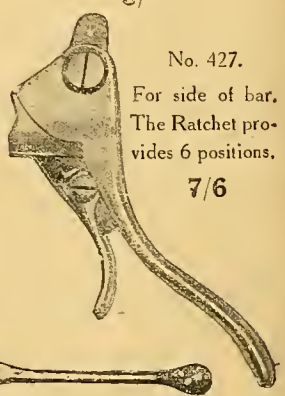


Bowdenlee Control Levers.

No. 406.
Automatic and immediate in action. No springs used. Remains rigid.
7/-



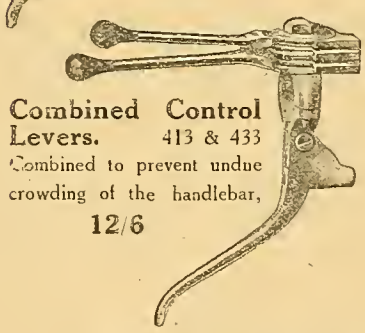
No. 426
One Point Ratchet Lever for Clutches, Brake or Valve Lifting.
6/-



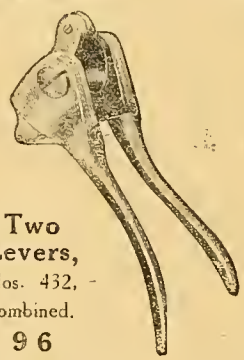
No. 427.
For side of bar. The Ratchet provides 6 positions.
7/6

No. 11. Bowden te Control Wire, **5d.** per foot, for valve; etc., control, nipples included.

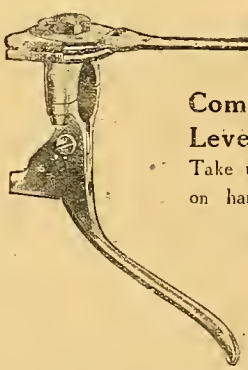
No. 12. Bowdenite Brake Control Wire. **9d.** per foot, nipples included.



Combined Control Levers. 413 & 433
Combined to prevent undue crowding of the handlebar,
12/6



Two Levers,
Nos. 432, combined.
9 6



Combination of Levers. 403 & 433
Take up no more space on handlebar than one control.
9/6

When complete controls are ordered, inner wires are nippled and outer wires are capped free of charge.

Send remittance to cover cost and postage—any balance will be refunded.

BOWDEN WIRE LTD. LONDON
Pratt St. N.W.

Godbold.

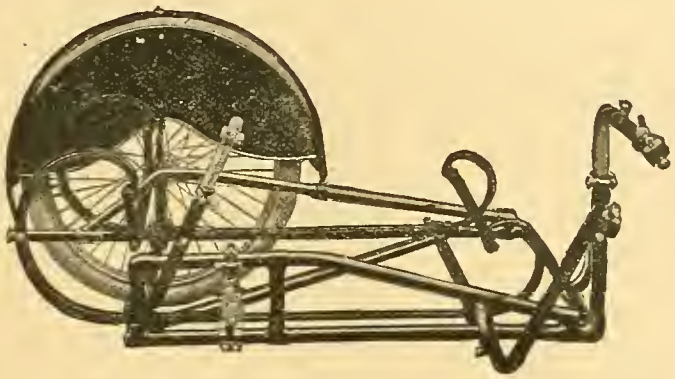
A NEW CHASSIS

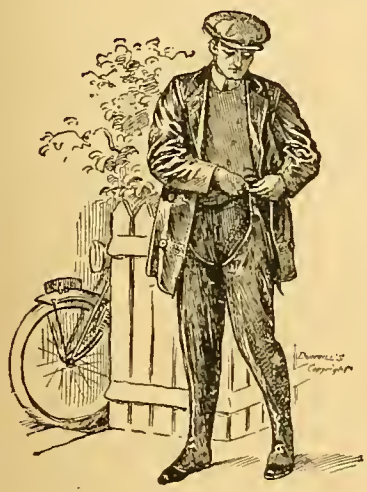
DUNHILLS' A.20 Model

THIS chassis is exceptionally strong, and is constructed on the cantilever principle, with front attachments brazed to the bottom member. There are no nuts or bolts to work loose, or joints to slip. The mudguard is clipped direct on to the chassis, which prevents stays breaking through vibration The A.20 Chassis can be supplied to fit "Indian" machines, and with either three or four point attachment.

Price, £7 8s. 0d.



A NEW MATERIAL



¶ If you will insist on your next suit of oilskins being made of smarter-looking and better finished material than the ordinary oilskin—

¶ If you would like to feel that you can absolutely depend on your oilskins to withstand the severest downpour and give you all-round satisfaction all the time—

¶ If you would like to be convinced that they will not show signs of wear even after hard and constant daily use—

GET THEM AT DUNHILLS

DARK GREEN OILSKIN JACKET AND TROUSER OVERALLS.

Jacket.....22/6
Overalls.....15/6

The finest suit yet made.

Our Illustrated M.C. Catalogue is free on request.

CLYNO

—the Lightweight of distinction.

So we have called it—so it is!

1914 proved it so and, when in the classic trials of the year, the CLYNO scored and we heard that oft repeated question—"where are the other Two-strokes?" we were proud indeed.

Where were they?—where are they to-day?—where will they be to-morrow?

We shall see, but certain it is that none of them will ever beat the splendid CLYNO record—

PARIS-NICE TRIAL—the only motor cycle of its class to gain GOLD MEDAL and TWO SPECIAL PRIZES

JARROTT CUP CONTEST—GOLD MEDAL and the only motor cycle of its class to gain award

LONDON-EDINBURGH—4 entered, 4 double journey GOLD MEDALS.

SCOTTISH SIX DAYS—2 GOLD MEDALS—only two two-strokes to finish

ENGLISH SIX DAYS—GOLD MEDAL—only machine in its class to finish

Well, that's distinction, is it not?—and the

1915 Model

will be just as capable—just as sure—therefore you should know all there is to know about it before you think of other purchase—Write us.

CLYNO ENGINEERING Co., Pelham St, Wolverhampton.

(To whom all wholesale and foreign enquiries should be addressed.)

Sole Distributing Agents for London: The Service Co., Ltd., 292, High Holborn, W.C.

BRITISH & FOREIGN GOVERNMENT Demands for both the CLYNO LIGHT-WEIGHT and SIDECAR COMBINATION must have, to-day, our first attention, but—

Cancellation of German-owned British Patents.

A Case of General Interest Concerning Motor Cycle Engines.

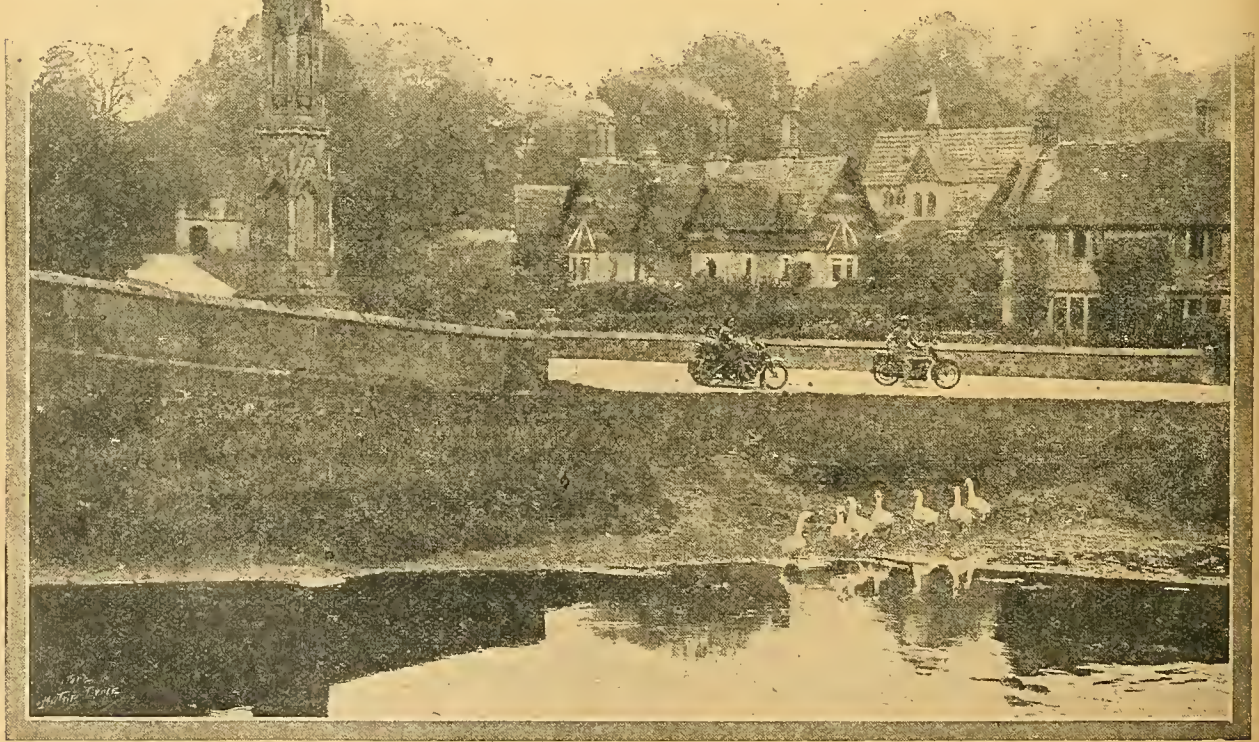
THE Board of Trade has now dealt with a considerable number of applications by British firms for orders to avoid or suspend German-owned British patents under the provisions of the Patents, etc. (Temporary Rules), Act, 1914, but we believe that, up to the present, there have been only a few instances in which the applications have been granted, and, as we understand that the Board of Trade does not propose to make public the grounds on which its decisions under the Act are based, the following particulars regarding cases in which a Birmingham firm has successfully taken advantage of the new legislation may be of interest.

The patents in question, which were granted in 1911 to the Neckarsulmer Fahrradwerke A.G., of Neckarsulm, Germany, relate to two inventions that are used in the construction of the well-known N.S.U. motor cycle engine, and the applications for their avoidance or suspension were made early in September last by Messrs. Humphries and Dawes, Ltd., motor cycle manufacturers, of Birmingham, who held an exclusive agency for the sale of N.S.U. engines in Great Britain and the Colonies.

When Messrs. Humphries and Dawes's petitions were heard by the Patents Court on the 12th October last, Mr. Arthur Sadler, patent agent, of Birmingham, who appeared on behalf of the applicants, explained to the court the nature of the agency agreement existing between his clients and the German patentees, and submitted that, as his clients were prevented by the war from obtaining the patented engines from Germany, and were therefore unable either to fulfil existing contracts with their own customers or otherwise to meet the existing public demand for the engines in question, it was desirable, and to the general interest of the public, that Messrs. Humphries and Dawes should be enabled themselves to manufacture the engines in this country. Mr. Sadler also argued that, having regard to the position in which his clients were placed by the agency agreement, the patents should be suspended solely in their favour, and he also informed the court that his clients were prepared to enter into an undertaking with the Board of Trade to keep a proper account of patented parts they might make in order to facilitate a reasonable settlement with the patentees at the conclusion of hostilities.

The Comptroller of Patents stated that, in the circumstances mentioned, he was inclined favourably to regard Messrs. Humphries and Dawes's applications, but suggested that it might be more satisfactory if, instead of merely undertaking to keep an account, they would make an offer to pay a definite royalty in respect of each of the patented inventions in the event of the court advising the suspension of the patents exclusively in the applicants' favour, and, after some discussion, Mr. Sadler agreed to adopt the Comptroller's suggestion, and undertook, on his clients' behalf, that any exclusive right the Board of Trade might grant should be subject to royalty payment based on a percentage of the estimated manufacturing cost of the parts of the engine actually covered by the patents. The Comptroller thereupon intimated that the court would take this offer into consideration when reporting on the cases to the Board of Trade, whose decisions would be issued in writing later.

These decisions have now been received by the applicants' agent, and state that the Board of Trade has ordered both the patents to be suspended exclusively in the applicants' favour, subject to terms which accord substantially with the offer made to the Patents Court at the hearing, and which will be embodied in a formal licence to be drawn by the Solicitor to the Board. The orders would, therefore, appear to place Messrs. Humphries and Dawes in the same legal position as if they held an exclusive manufacturing licence for Great Britain from the patentee company, and we understand that they are now proceeding with arrangements for the immediate production of the N.S.U. type of engine on a large scale.



ILAM, ON THE DERBYSHIRE—STAFFORDSHIRE BORDERLINE, FAMOUS DURING THE GREAT PLAGUE.

The exquisitely designed cross and drinking fountain in the Decorated style was erected in 1840 in memory of the first Mrs. Watts-Russell by her husband.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rear Lighting.

I have a motor cycle and sidecar. On the sidecar I have a lamp which shows a white light in front and a red light behind. Is this sufficient for a rear light?—W.W.

The rear lighting regulations will be found in our issue for December 25th last. The rear light must be placed on the off side of the bicycle or sidecar, and in such a position that it is visible from any part of the road in the rear.

Difficult Starting.

I have a 3½ h.p. single-cylinder machine, magneto (1905 Rex), purchased some months ago. Being in the engineering trade I at once dismantled the engine, fitted new gudgeon pin, rebushed big and little ends, examined piston rings, ground valves, fitted new tappets, repaired cams, etc., cleaned cylinder, and crank case; in fact, I did all that was necessary to make it a satisfactory job. I fitted a new sparking plug, and had magneto overhauled by experts, but I have to run at a great speed to get it to fire. I have had the carburetter cleaned and correctly adjusted, and all induction pipe joints made air-tight. It runs well when I get it to go, but that is my difficulty.—J.D.

There are several possibilities which might cause the trouble you mention, but it is most likely to lie in the magneto points. See that the faces are trimmed flat and polished bright, and that they open not more than the thickness of the gauge on the magneto spanner, or about the thickness of a rather thick visiting card. Possibly, also, your air slides or inlet valve guide leak air badly, or you require a slightly larger jet in the carburetter.

A New Piston.

I have a two-stroke attachable boat-motor. The lubrication is on the usual petroil lines, but the engine a short time ago took to refusing to start on petrol mixed with oil. I used to start it on petrol alone, and, after a short time of running, pour into the tank the proper mixture. This caused under-lubrication causing the white-metal lining of the big end to break. The broken pieces got into the cylinder and chipped out of the piston a piece about half an inch deep. This bite in the piston comes exactly opposite the inlet port in the cylinder wall, and so must let the gas enter the crank case before it should. Can you tell me: (1.) Would it be worth fitting a new piston? (2.) Where could I get a new piston, the works in France being in the hands of the Government? The piston head is a very peculiar shape, even for a two-stroke, and I think it would be necessary to have it specially made.—RUGBEIAN.

(1.) It would certainly be worth while having a new piston, but it is hard to say how you can obtain it under the circumstances. (2.) We should advise you to apply to a local foundry accustomed to motor or motor cycle castings: such a firm as Rowland Hill, Coventry, or the Britannia Foundry, Coventry, would be able to cast you a similar piston, which you could afterwards have machined to fit the engine. In fact, if you are a skilled mechanic yourself, it would be possible to turn the job out in the school shops. However, a new piston cast from the broken one might prove rather an expensive job, and we should advise you to obtain a quotation.

A Stretched Band.

I have been for some time using a band to protect my tyre on rough roads. At first the band was a perfect fit and gave great satisfaction, but it has now stretched, not longitudinally but laterally, so much that it seems to be no longer safe to ride with it on. Would it be easy to have the clips taken off and re-riveted so as to make the band about ⅜in. narrower? At present I cannot inflate the tyre so as to take up the slack, even when it is board hard.—L.K.G. (Gibraltar).

We see no reason why the clips should not be taken off and refixed in such a position as to take up the slackness of the band.

EQUIPMENT

WILL FORM THE MAIN CONTENTS OF A SECOND SPECIAL ISSUE OF "THE MOTOR CYCLE" TO BE PUBLISHED ON THURSDAY, DECEMBER 10th, 1914.

Hints on Driving a Two-stroke.

(1.) In stopping for traffic in front is it sufficient to close the throttle, or must I put the engine free (it is a two-stroke two-speed lightweight), or must I lift the compression valve as well? (2.) Is it absolutely necessary to start off on low gear? (3.) Which brake is it advisable to use most, back or front? (4.) About how much oil does the magneto need?—P.L.

(1.) The best way to stop a two-stroke is to lift the compression valve. This in itself forms an excellent brake. (2.) It is not absolutely necessary to start off on low gear, but it is usually found to be more convenient, as the engine will start quicker and the machine will run along slowly. (3.) Use your back brake for preference. (4.) You do not state what magneto you wish to lubricate. If it is of the Bosch type very little oil is required, say a drop per week. Some magnetos, such as the C.A.V., are packed with grease and require no lubrication.

Building a Two-stroke.

Would you be kind enough to give me some information regarding a small two-stroke engine which I made myself? I cannot get it to run, as it will only fire weakly, not enough to keep it running. It is made exactly like the diagram in the two-stroke number, July 23rd, 1914. The ports are in the right places, but I do not know if they are large enough; the carburetter and spark are all right. The crank case is perfectly airtight, and small. The carburetter is a B. and B. lightweight, adjustable jet. I get the same results however I alter the jet and control levers.—E.J.D.

The diagram in *The Motor Cycle* was purely diagrammatic, and not intended to be a working drawing. However, the ports were approximately in the correct position. Without seeing your motor and the drawings it is impossible to say where you have gone wrong. The size of the ports largely depends on the general design of the engine. We should imagine it is likely that you have too low compression, both in the crank case and cylinder, and possibly your ports are not large enough. The position of the ports and their area is most important. It is quite impossible for us to locate your trouble without a personal examination of the machine or working drawings.

Combustion Space Formula.

(1.) What is a satisfactory formula for determining the volume of a motor cycle engine combustion space required to obtain a given compression pressure? (2.) What would be the probable cause of the following: When out for a run recently, the engine (a 600 c.c. Sarolea a.i.v. twin) began to misfire on one cylinder and finally stopped altogether. The back cylinder plug was taken out, as many times previously I had been troubled with this plug getting sooted up through superabundance of oil, as is often the case with a twin. On examining the plug, it was found to be a nice brown colour, dry, and in tip-top condition. It was thought that perhaps the front plug had got a piece of carbon between the points, so out it came, and I was somewhat surprised, to say the least, to find it absolutely swimming in oil, and also carboned up; on looking further oil was even seen exuding from the front inlet dome. After cleaning the plug the machine ran as well as ever. Verily, there is no end to the tricks of a petrol engine! Why should the front cylinder get oiled up, when previously it was always the back cylinder that was the culprit? Since the above happened I have had the engine down, and had a very hard job to get the cylinder off the front piston; in fact, the cylinder had to be knocked off with a piece of wood and a heavy mallet. On examination, the skirt of the piston was found to be considerably distorted, and it was at once scrapped. Do you think the distorted piston would have had anything to do with this strange oiling up? The compression was excellent before taking down. (3.) On drawing out the gudgeon pins of above engine, I was surprised to note that the little ends of connecting rods were very small, and had no provision for bushes at all. The gudgeon pins were not hardened. As I want to fit new gudgeon pins because of wear, should they be hardened? Could the little ends be case-hardened after reamering out the hole true for the new pins, without affecting the strength of the rod?—C.F.E.

1.) Assuming that atmospheric pressure is 15 lb. per square inch $x = \frac{15\,C}{P - 15}$ is the formula you require, where

x = Combustion space.
C = Cubic capacity.
P = Pressure required.

About 75 lb. per square inch is the usual compression employed on a touring 3½ h.p. single-cylinder machine. (2.) The distorted piston is almost sure to be the cause of your trouble, as oil will flow past the piston skirt, and very likely pass the rings as well. This would be most likely to occur with the engine running throttled down or after descending a hill with the throttle closed. We have known this to occur on other engines, and it is often caused by lack of lubrication to the front cylinder, causing a considerable amount of wear in the bore, after which a slight overdose of oil will permit leakage past the piston. (3.) New gudgeon pins should be hardened, and the small ends, if possible, case-hardened after truing up. Whether this latter is possible or not depends on the thickness of the metal in the top of the rod. If ⅜ in., or over, this can be done, but care should be taken not to harden deeply, or the small end will become very brittle and break under heavy strain. Also, you must take care to use plenty of oil until the bearings are run in, as two hardened steel surfaces running one on the other are apt to become almost welded together if a seizure occurs.

Piston Rings Sticking.

I was interested in the article on two-stroke engines in *The Motor Cycle* of October 22nd, as I have a Clyno. I can confirm what the writer says *re* piston rings sticking up, but I should like to know if there is a cure for it, and if the trouble is as bad with other lubrication systems? I find mine stick up very quickly indeed—200 miles is quite sufficient—and I cannot remove them without breaking them. I have tried soaking the piston in paraffin. I wrote to the makers on this point, and they advised me to use less oil and remove the cylinder oftener (I had not found out then how quickly they stuck up). I have used Huile de Luxe and Wakefield's Castrol with similar results, and only slightly in excess of the recommended quantity, and that hardly seems enough, as the piston tries to seize up if the machine is ridden at much over 20 m.p.h.; but this may be due to the stuck-up rings allowing the hot gases to dry up the piston and cylinder walls (this did not happen during the first 1,500 miles or so). The engine also knocks very readily on hills, needing constant retarding of the spark and closing down of air. A Senspray carburetter is used, 30 jet, and single-point Sphinx plug. If you can help me on these points I shall be much obliged.—X.

We cannot understand your trouble without personal examination, as, having ridden a machine of the same type throughout the year, we have seldom had a ring stuck up at all, and when this has been the case it has been a very simple matter to free it without breakage. If you have found that your power has been falling off, with a gradually increasing tendency to knock, we should be inclined to suspect that a plain bearing on the flywheel side has worn somewhat, thus causing considerable loss of crank case compression. We have recently cured a somewhat similar trouble by replacing this bearing. Five charges of oil to the gallon are the maximum necessary with a two-stroke Clyno once it has been run in. A 28 jet should be quite sufficient for all ordinary work.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"E.G.F." (Yorks).—Wall tricarriage. Comfort, skidding, and reliability.

"C.G.C." (Manchester).—Mills-Fulford Empress sidecar. Suitability for 6 h.p. twin.

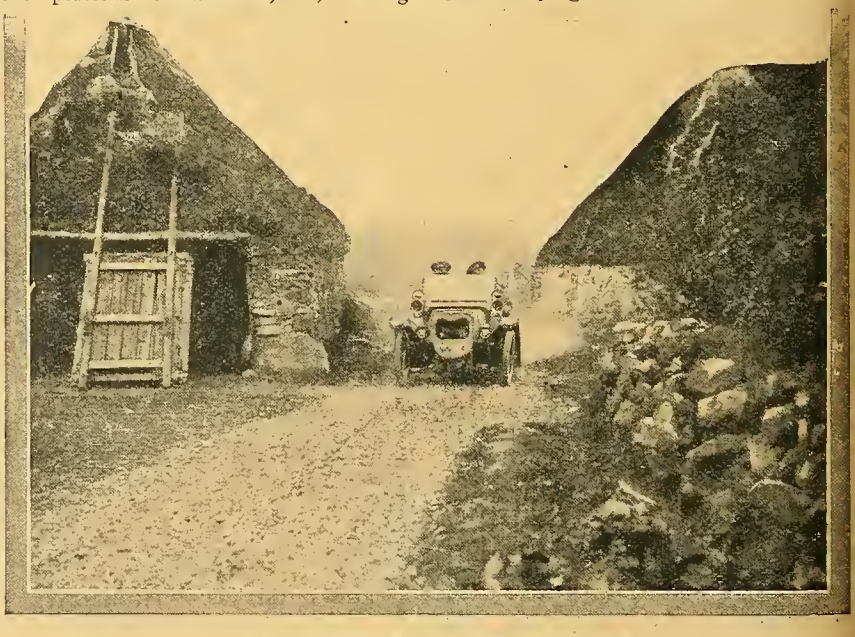
"A.L.L." (South Africa).—Wilkinson twelve-jet carburetter on 3½ h.p. twin James.

"R.F.M." (London).—T.M.C. Reliability, accessibility, consumption, hill-climbing, and slow running.

"W.M." (Dawley).—2¾ h.p. A.J.S. Reliability, durability, average speed over give and take roads, hill-climbing, and consumption.

"P.K." (South Australia).—Advantages of Badcock's bypass fitted to Amac carburetter. Ease of starting, slow running, and petrol consumption.

"W.H.C." (Enniscorthy).—Levis Popular, New Hudson, and Sun-Villiers. Reliability, speed, petrol consumption, and hill-climbing, also greatest gradient each can accomplish with standard fixed gear, carrying a 9 st. rider.



A TOURING SCENE IN THE HIGHLANDS.

The BRITISH MADE Watford Speedometers

The First MOTOR CYCLE SPEEDOMETER

to enter and pass an officially observed

AUTO CYCLE UNION 3,000 MILES TEST

Venton, Totnes, July 18th, 1914.

Dear Sirs,—You will be glad to hear I won the Special Gold Medal in the Exeter M.C.C.'s Trial, held from Exeter to Staines and back last Saturday. I used one of your "Trip" Speedometers, which was most accurate, both as to speed and mileage. The hand was perfectly steady at any speed, and ran with a stop watch perfectly. The milometer registered the miles to the 10th very accurately throughout the whole trip. I consider it an ideal instrument, and speak from a good deal of experience.

(Signed) J. E. D. MOYSEY

THERE IS A REASON FOR WATFORD SUPREMACY.

Don't buy new tyres.

Have Your Old Ones Rebuilt.

We will retread your tyres—however badly worn—equal to new at a very moderate cost. Our patent compressed air system is a guarantee of efficiency and perfect road service.

If your tyres are badly burst or torn away at the bead, send them to us. We will make a highly successful repair job. In the former case we employ our patent vulcanising process. In the latter case we use chrome leather for the work. Both ensure the repaired parts being actually stronger than any other part of the tyre.

We are Britishers, and like all best British firms enjoy a solid reputation for the thoroughness of our work.

Limitations of Lightweights.

DURING the last month or two we have noticed with interest on several occasions that parties of motor cyclists tour about together, some on high-powered motor bicycles, others on machines of medium powers, and others even on lightweights. Now, it is obvious that the lightweight rider is hard pressed to keep up with his friends, but nevertheless he succeeds by some means or other in so doing, though seemingly regardless of the strain which he is exacting from his lightweight and sometimes frail machine. It is all very well to attain for a short distance the maximum speed of which a machine is capable, but it is quite another matter to maintain that speed for any length of time. The lightweight is not intended as a fast touring mount, and nothing will bring about its demise more quickly than putting it to uses for which it was never intended. The lightweight fills a purpose, and an important one, but it is not to be driven about with throttle wide open and spark advanced as a regular part of its life. It seems almost superfluous for us to point out that a machine working continuously at its highest capacity is bound sooner or later to give trouble, owing to every part of the machine being stressed to the utmost limits. Lightweight motor bicycles in the majority of cases are geared fairly low (sometimes six to one, or even lower on top gear), and it requires but a simple calculation to show that even at legal limit speed these engines are turning over at 1,667 r.p.m., that is on a machine fitted with 24in. wheels, which is the size most generally adopted on 1914 model lightweights at any rate. At thirty-five miles per hour, which represents the maximum speed of the majority of the smaller-powered machines of modern design, it gives a r.p.m. of 2,916. This latter speed is all very well for a short distance, as we have mentioned, but to expect a lilliputian engine to give off its utmost continuously is expecting too much.

It is a generally accepted fact among experienced motorists that the advent of the light car was delayed several years by troubles which were the direct outcome of overloading. In the early days of the movement it was no uncommon sight to see four-seated cars propelled by 6 h.p. and 8 h.p. engines, but they were such inefficient hill-climbers and troubles were so constant, owing to the fact that their engines were always working at their utmost capacity, that people fought shy of low-powered cars, and it took several years to wear down the opposition. We do not desire history to repeat itself in the case of the lightweight motor cycle.

It is certainly curious that men having a common interest and desirous of accompanying one another on their jaunts should select machines so different in size and design, though we believe it is often intentionally done to add interest to one another's outings in observing and comparing the performances of the mounts. Nevertheless, such riders would be well advised in future to consider whether they are doing one another a good service. Most probably few have looked at the matter in this light. The other day we noticed a couple of riders bowling along a fine stretch of road, the foremost rider on a 3½ h.p. single-cylinder machine. He was followed by his friend on a lightweight, who had his head down and a look of glee on his face, possibly at the sound of his little engine screaming round at a terrific pace.

Those who take a pride in the condition of their machines, and more especially as regards the power output, will not need two hints to handle their lightweights in a more rational manner. Long life is only obtained by careful usage; one can readily believe that lightweight motor bicycles might receive a serious set back were they to be put to indiscriminate uses such as fast touring about the country and hauling sidecars for long distances, seeing that they were neither designed for such work nor able to do it satisfactorily. Hence our words of caution.

The Motor Cyclist on Active Service.

THE ACTUAL DUTIES AND THE MOST SUITABLE TYPE OF MACHINE.

A GREAT deal has appeared in the papers about the hairbreadth escapes of motor cyclists, and numerous stories have been published concerning those who have been unluckily wounded and sent home. Elaborate pictures of a motor cyclist dashing through Uhlans, waving his revolver round his head, are all very well, but they are nothing like the real thing. Some people think that a motor cyclist on active service is a scout, but this is not the case. He is a despatch rider, and is used for carrying despatches from one division to another. Motor cyclists are also used to carry on communication between the headquarters and the different sub-divisions of the Army Corps, while they also prove invaluable in the case of failure in the telegraphic communications.

Those who have taken part in a Six Days Trials do not know what riding is until they journey to France and try the so-called roads they are asked to negotiate. One of the worst road obstructions is a large round hole left by the Royal and Imperial "Black Marias" which the Germans are issuing to "General French's contemptible little Army." These holes are about three feet round and about two feet deep. When one hits them at speed at night it is very difficult to make quite certain what happens, but one usually finds oneself in a very wet ditch complete with machine.

The roads we are now working over are of the worst *pavé* in the world, about every third brick being about two inches below its next door neighbour. The roads are very narrow and only half the surface is paved, leaving about four feet each side of thick mud. Here the motor cyclist is expected to ride, as the centre is occupied by literally thousands of motor lorries. These conditions are all very well in fine weather, but when it rains the cobbles become like a sheet of slime. If the reader cannot imagine these conditions, let him go to Kew Bridge and ride to Hounslow, through Brentford, on a very greasy day, and encounter two rows of lorries, one going each way, and both trying to do the other out of the centre of the road. Then you have the motor cycling conditions on active service.

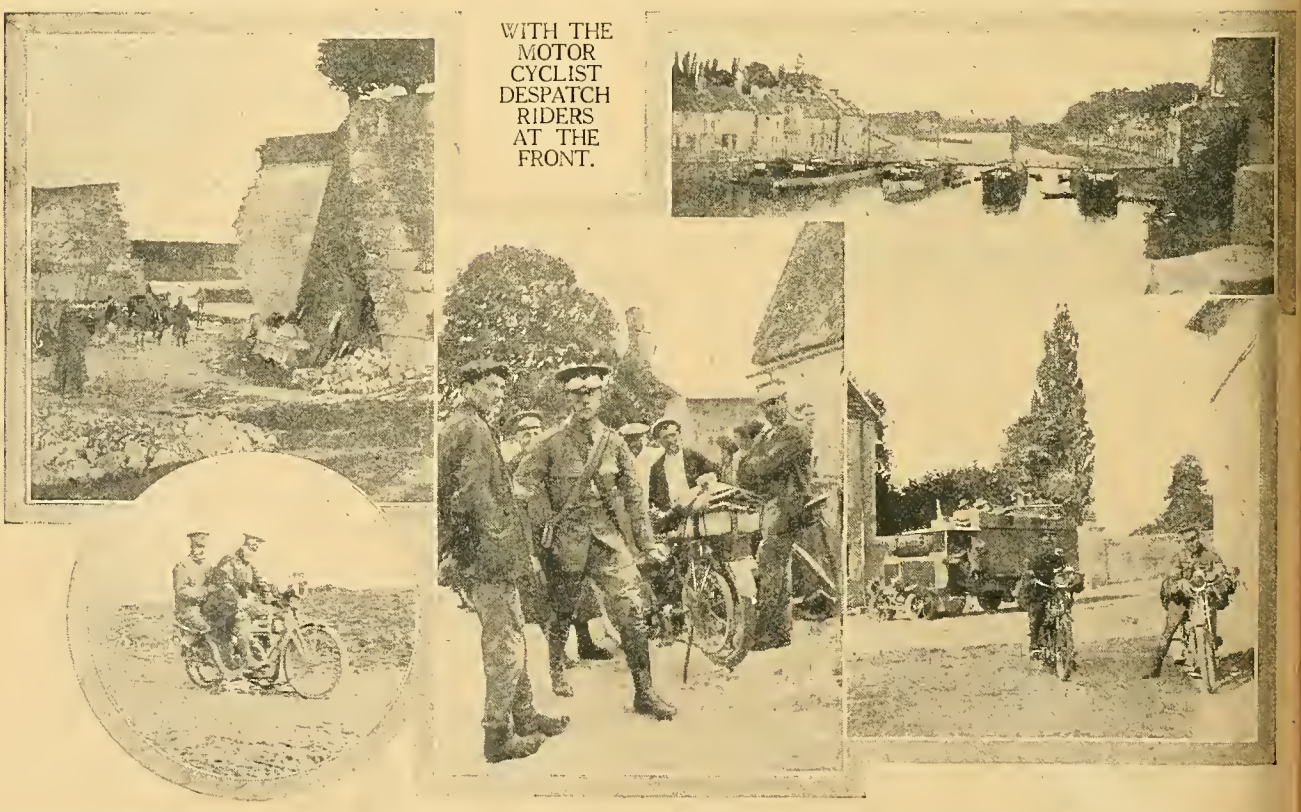
Dodging the Motor 'Bus.

Despatch riders are often called upon to cover long distances, 200 kilometres (124 miles) being nothing for one day. Another joy has just arrived in the shape of the London motor 'bus, which is the best skidder in the world. It is quite fun passing 'buses, as we dodge the front wheels of one to be hit by the back of the next as it swings across the road. Troops are also very difficult to contend with, but one must not be too hard on them, as they have very hard work to get along on greasy roads, and they must be passed at a slow speed.

With regard to the types of machines most suitable for the work, it is quite impossible for anyone to sit down at home and try to express an opinion. Of course, a speed gear is essential, and three speeds are much more satisfactory than two. The best all-round machine is the medium weight, which we are using in great numbers. A 3½ h.p. is all very well for a long run to the base, but it is no good among the troops, as one cannot paddle it off as one would like. Some of us have expressed a desire to try a three-speed two-stroke of about 2½ h.p., which must be light enough to lift out of a ditch and to enable one to get it out of the way quickly in the event of falling in front of a 'bus or lorry.

When we came over we expected to have much transmission trouble, but this has not been the case. The belt has been absolutely satisfactory, and to the writer's knowledge there has been no failure to deliver a message which could be attributed to the failure of a belt. Engine troubles have been scarce.

One frequently suffers from a complaint known as having the "wind up." The other day a motor cyclist was standing beside a church tower at three o'clock, but it only struck two, as the tower, complete with clock, was removed by a shell on the second stroke; the motor cyclist got the "wind up," collected the "revs.," and took up a new and safer position. S.O.B.

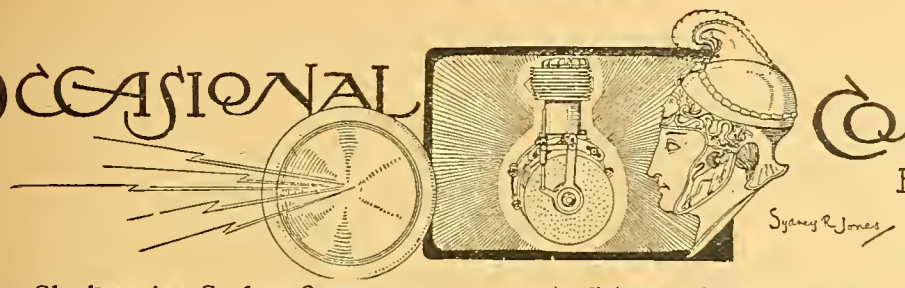


WITH THE MOTOR CYCLIST DESPATCH RIDERS AT THE FRONT.

Motor cyclists (riders of B.S.A. machines) convoying a transport.

OCCASIONAL COMMENTS

By "IXION"



Clock-spring Carbon Scrapers.

In my lazier moods this summer I have used the clock-spring carbon scrapers, marketed by sundry accessory firms, in preference to dismounting my cylinders, and I have also resorted to the Cylclean oxygen blowpipe cleaners on three occasions. In each case the engine's running has shown signs of re-carbonisation considerable earlier than I had anticipated. The solution, of course, is that neither of these time-saving processes tackles carbon in the piston ring grooves nor inside the piston head. One would suggest that the use of a spring scraper or a Cylclean apparatus will be very fairly satisfactory provided the engine compression is tolerably leakproof, but that if the compression is easily overcome, though the valves are not pitted, it is a false economy to shirk the removal of the cylinder.

Thick and Thin Electrodes.

A well-known sporting rider writes to the office in praise of the mysterious "K.L.G." plug, supposed to have been brought to Mr. Coatalen's rescue by Mr. Guinness when all known makes of plug gave up the ghost after a lap or so in the Sunbeam cars practising for the Manx T.T. Incidentally, he gives it as his opinion that a plug with multiple electrodes will stand up well in what he calls a "wet" engine, *i.e.*, an engine which permits a lot of oil to reach the combustion chamber, but that such electrodes, which are necessarily thin and light in proportion to their number, burn away rapidly in "dry" engines, where three or four piston rings manage to maintain a blockade against insinuating lubricant. The point is new to me, and it would be interesting to hear whether other experienced riders can confirm it. It is common knowledge that thick electrodes, such as figure on "single point" plugs, stand up well in use, but personally, I have no materials for pronouncing a verdict on the alleged increased durability of thin electrodes in "wet" engines. I should not have thought that the "wettest" engine drew in enough oil to cool the plugs at all materially.

The Simple Cycle Car.

I have never been wildly enthusiastic about such "simple cycle cars" as have actually materialised upon our market, for the reason that the vast majority of them were extremely rubbishy, and quite unworthy even of the small cheques for which their designers were ready to supply them. Nevertheless, I feel extremely regretful that the popular light cars have been permitted to swamp the field so completely. Apart from the ever-green Morgan, there is hardly a single genuine "cycle car" left in existence. Both the name and the thing are practically obsolete. It is probable that the luxury and reliability of up-to-date sidecar outfits are quite as much to blame as the light cars for their decease. But surely our brains are not baffled? There is room on the market for a £100 four-wheeler, and when a really good one comes along it will hit the sidecars between wind and water. In the meantime, the Yankees are working hard, and are already producing vehicles at about 500 dollars a time, vehicles which to some extent represent a compromise between our moribund cycle cars and our booming light cars. These vehicles are certainly not worth a fastidious user's attention at the present moment, but they contain the germs of vast developments. The gap is there, even if it is momentarily plugged by the high-powered sidecar outfits. If we don't fill it in more permanent fashion, America will jump in and snatch a long start, as she has done before in other fields.

Wanted, a Light, Cheap, Two-speed Hub.

I cannot remember whether I have ever had the hardihood to confess in print that I still ride a push bicycle. My ten-year-old boneshaker has a Sturmey-Archer three-speed hub, which originally cost about 35s. (as near as I can remember), has never given any trouble at all, and has never been oiled or adjusted by me; I daresay it has received some little attention when I have had a new tyre fitted or the frame re-enamelled. Between this featherweight and inexpensive gear and the heavy, delicate ten guinea gears fitted to 500 c.c. petrol-driven roadsters there exists no halfway house. At the present moment the motor cycle industry is launching out in a new direction and producing a fleet of 100 lb. machines, ranging from 1½ h.p. to 2½ h.p. and selling at prices from £25 to £45. Of these the £25 patterns have obviously the best chance of a really large market, but at present they are mostly single-geared. The lack of a reserve gear does not disqualify them for ordinary use, but it will prevent their ever being widely popular with the numerous riders who want a light, cheap machine for *touring* work. It is quite difficult to plan routes for even a week-end's tour which will not include several hills beyond the scope of a single-geared "baby." If gears of the existing three-speed hub type or even of the light counter-shaft pattern are adopted to complete the specification, the price towers at once to well over £30; often a very great deal more.

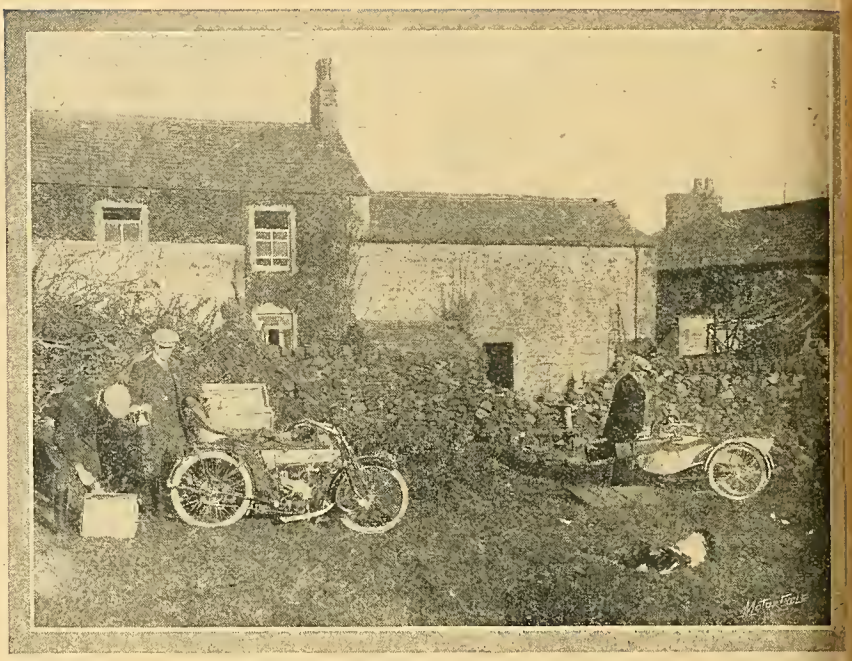
Accessories and Equipment Issue.

A Special Issue of "THE MOTOR CYCLE" will be published on Thursday, December 10th, devoted to Accessories, Tyres, Clothing, and Equipment generally.

A Sidecar with THE Autumn Guns

By H. MORTIMER BATTEN.

THERE has been little shooting in England this autumn owing to the fact that most of those who usually participate in the sport have been called to serve the country, and all honour to them. In most parts the grouse have been left to crow themselves hoarse from the tops of the butts, while the pheasants have become so numerous, and have learnt to regard life as an affair of such absolute security, that it is with difficulty one can motor over our woodland lanes without killing a few of them. Personally, I never try to avoid them, and more than once have nearly come a cropper while making a desperate attempt to run down an old cock pheasant meandering aimlessly about the road.



A SIDECAR WITH THE AUTUMN GUNS.
Two P. & M. outfits being loaded up with luncheon baskets and guns.

On the immense game preserves of Scotland, however, things have been somewhat different. In some parts it has been necessary to pursue the ordinary course of events in order to prevent the moors and coverts becoming overstocked, while quite a number of Scottish estate owners have been compelled to consider the financial side of the question and to cater for the markets.

An Unlucky Stalk.

For two years past the sidecar outfit possessed by the writer has proved most valuable during the autumn shoots in Scotland, and this season it was once more called into commission. The estate over which the shooting extends consists mainly of open stretches of country, thinly timbered with pine trees and gigantic Scottish thistles—if the latter may be described as timber. I shall not forget the day when a puppy of mine mistook one of these thorny obstructions for a sitting rabbit, and after a most elaborate stalk succeeded in catching it.

Most of the land is of sandy formation, severed by rapidly running brooks which have washed their way through the sand and down to the solid bedrock. Consequently the banks are enormously high, and these banks are literally honeycombed with burrows. Rabbits exist by the thousand, and unless they are killed off regularly they either contract disease or become so numerous that they destroy the grazing grounds for sheep and cattle.

This year we were compelled to make up the number of guns as best we could, most of the usual members of the party being at the Front. Two or three neighbouring gamekeepers were called to arms, likewise the village cobbler and hotel-keeper. Our main objective was, of course, rabbits, and we intended leaving the more valuable game till next season, when, let it be hoped, things will have resumed their normal order.

Narrow Bridges.

As is usually the case, the best shooting is situated at a considerable distance from the house, and, as the roads are appallingly rough and narrow, a choice as to means of transportation is somewhat limited. A big expensive touring car is hardly the thing for these cross-country jaunts, and, at any rate, its use is out of the question on account of the bridges over the burns. These bridges are made of timber, moss-covered and rotten with age, and are for the purpose of moving sheep and cattle from one grazing ground to another when the burns are flooded. Most of them are too narrow to admit the passage of a car, and those that are not too narrow would probably give way at the most inconvenient moment. On one occasion the back wheel of my motor cycle actually crashed through the planks, imparting a similar sensation to that which one feels when one sits on the extreme end of a form and sees the other end rise rapidly skywards. One can imagine the surprise that might have greeted the absent-minded old milch cow strolling leisurely across! Strange to relate, the pack ponies had crossed the bridge just ahead of me, and had everyone avoided the rotten plank!

This season most of the ponies had been sent to fill the gaps left in the stables by the commandeering of horses, so we were more dependent than usual upon our cycles and motor cycles. The first morning out the head keeper, having disengaged his legs from the tangle of leashes by which he led an army of kind-eyed, wet-jawed old spaniels, proceeded to pack bag after bag of wriggling, clucking ferrets into my sidecar.

"Look here, McLaren," I expostulated, "I don't mind rabbits, and I have been known to carry salmon, but I jib at ferrets."

A Sidecar with the Autumn Guns.—

McLaren had made up his mind. "It jolts the wee things up if we pack 'em on the ponies," he explained, producing still further bags of unsavoury odour. "They'll ride easy in here, sur, and maybe they'll work all the better for it."

A Bumpy Ride.

So away I went with a sidecar load of ferrets, a small boy, giggling jubilantly to be back at his old place, seated on the carrier to open gates and so on. It was a bumpy ride for him, but nevertheless his heart was light as the thistle seeds. We took up our positions at the edge of a long line of cliffs which extend, a natural wall, across the face of the country. The cliffs are about thirty feet in height, and the burrows are all along the foot of them. Here the ferrets worked, and the men in charge of them flattened themselves against the rocks, unseen by the guns above. It was splendid sport, for the rabbits bolted down the hill, dodging in and out among the pine trees, and making the best of the cover. Perhaps, for five minutes, all would be quiet, then again that warning whistle would sound from below. For a time sport would be thick and fast, and the boy was kept busy re-loading the spare gun and whispering, "Your rabbit, sor!" They were all my rabbits according to him, and they seemed to bolt in spasms, but bolt they did.

Beating the Bracken.

After an hour or so we tired of this kind of sport, and the damp, peaty ground began to strike chill through the rugs on which we lay. Numbers of rabbits had got away untouched owing to bad shooting and the profusion of timber, and had taken cover in the bracken lower down the hill. So away we went after them, leaving the men to recover their ferrets as best they could; the guns took up positions in the open, and the pack of spaniels was let loose.

A SIDECAR WITH THE AUTUMN GUNS

(Left.) A lively load. During the shooting season the sidecar comes in useful for all kinds of work. The photograph depicts a Lowland keeper loading up with the necessary impedimenta including ferrets

(Top.) A quick and handy way of carrying beaters from one cover to another.

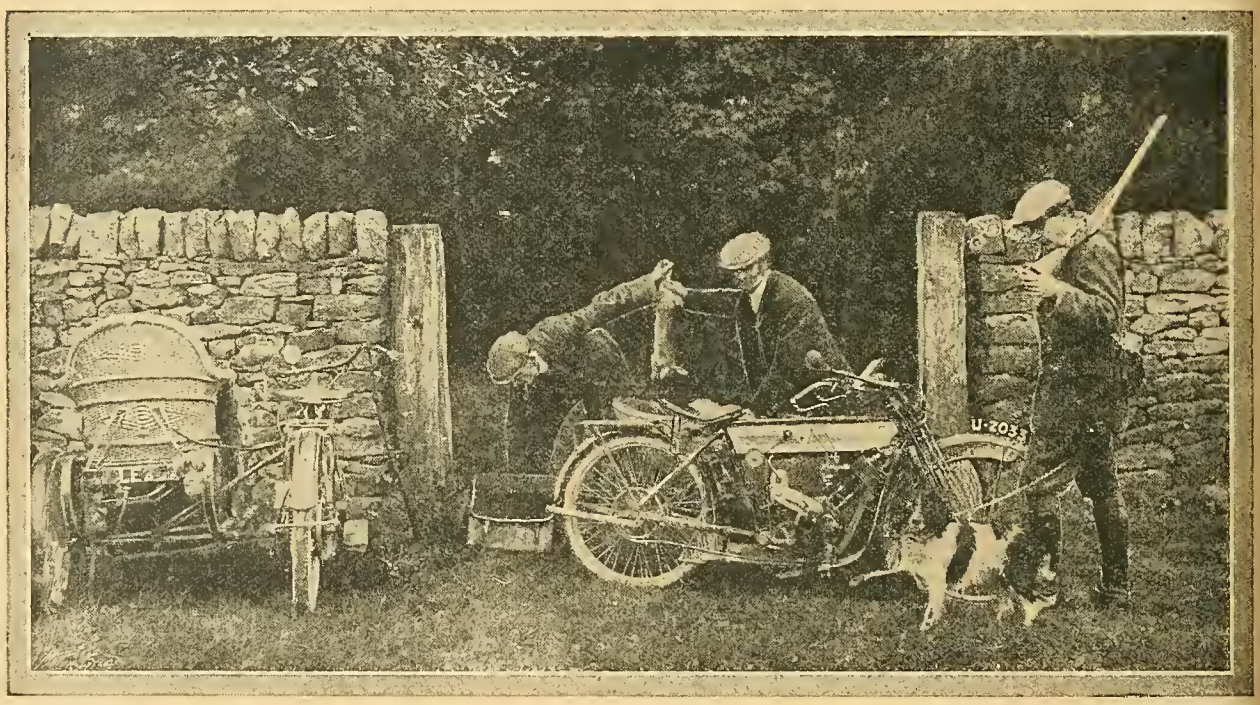
(Right.) The sprint for home by vague and uncertain byways. Note the mascot—black-cock plume, the mascot of a famous Highland Regiment.

A Sidecar with the Autumn Guns.—

Little did we expect the assorted bag that broke cover. First a mangy old red fox limped out, then a brace of roe deer shot through the widest gap. A regular maelstrom of pheasants whirled over our heads, and we all blazed away at them heedless of the bolting rabbits we were really out to kill. Most of the latter made for the allotment over the wall and crouched in the long grass. It was while walking them out that the hotel-keeper distinguished himself by firing both barrels slick down the line, and was politely requested to go home.

Not till the light gave out did we begin to think of our warm baths and comfortable dinner at home, and to realise we were a bit stiff. When I reached my machine I found the sidecar brimful of sanguinary rabbits, the stiffened corpses so neatly packed that not an inch of room was wasted. Strange how, on these outings, every vehicle is at the common disposal of the party, while its owner has no more say concerning it than anyone else!

My pilot had promised to lead me home, but it seemed to me that we were heading wildly in the opposite direction. As a matter of fact, we made a wide *détour* to avoid gates. We lumbered over allotments, where the path was a matter of imagination more than anything, and where dry mounds of earth fouled one's footrests with surprising regularity. We wound our course up narrow cart tracks, overgrown with moss and green grass, in which the wheel spun merrily on the least little gradient. Then as we dropped into the valley the mist became thicker, and already it was long after lighting-up time. At last, when I was giving up all hopes of ever seeing home again, the little Douglas plunged through a clump of trees on our left, and there we were at the back of the house. An hour later we were all, cobbler included, clinking our glasses to the good luck and safe return to those who are shooting elsewhere.



Each machine is at the common disposal of the party, and the keepers see that no one returns with an empty sidecar.

A Sporting Run Home.

I had hopelessly lost my bearings during the day's wanderings, and the white mist that hung about the trunks of the pine trees did not improve matters. "Never mind," said my host. "Follow me. I'll lead you home O.K."

Off he buzzed on his little Douglas, almost vanishing into the autumn mists before I got my engine going. It is surprising how heavily rabbits weigh, and how difficult it is to keep pace with a solo machine when riding with a sidecar full of them. One or two jumped out, but there was no stopping to pick them up The little Douglas accelerated so exquisitely on every open bit of going that it was all I could do to keep up.

To pursue a description of the days that followed would, perhaps, mean too much repetition, though the uses to which we put the sidecar outfits were many and various. The usefulness of a sidecar for shooting purposes must be experienced to be believed. It can go where a car cannot, and where most car owners would not care to risk their tyres, while the quantity of stuff it will carry is really surprising. My sidecar is a Watsonian featherweight, and, in spite of its lightness, is just the thing for the work and the power of the machine. Many a time I have carried a regular avalanche of game over narrow forest lanes, made originally by the woodsmen, and overgrown with rank vegetation A few sacks save the upholstering and prevent unpleasant associations from being left.

Not only is a sidecar outfit handier and cheaper than a car for getting about the shoot, but it comes in useful in a score of different ways For instance, on this par-

A Sidecar with the Autumn Guns.—

ticular shoot the distribution of game was a somewhat difficult matter to arrange in years gone by, but a brace of sidecar outfits have solved the difficulty. A run round to the neighbouring farms on the "rest days" is quite a pleasant change, as well as being a quick and economical way of doing it. I am not surprised to hear that on several big estates motor cycles are being extensively used during the shooting season, for certainly their usefulness has only to be realised for them to become more general.

To me the motor cycling incidents of the shooting season are among the most delightful of its recollections—the early morning runs through the dew-drenched woods, the sprints for home after the shadows have fallen. There is an atmosphere of adventure in taking one's queer loads across country—returning by vague and mysterious ways that always reveal something unexpected, plunging suddenly into a watersplash and bouncing out on the other side in pursuit of the dim figure of the pilot. The damp scents of autumn, the crisp rustle of the brown leaves, the white mists of the valley through which strange monsters loom and disappear, are things that retain possession of the mind till another autumn comes round, and I oil up again for the long, lonely journey to the North.

Saving a Poacher.

One night I was returning home with McLaren and two tired puppies on board by a road which skirts the river, when suddenly we beheld two water bailiffs making the best of their way along the ditch. It was the time of the year when the salmon are running, and as poachers are not unheard of in that part of the world we guessed what was in the wind. Half a mile further on we saw Peter McCary—ex-soldier, ex-prospector, the most lovable old heathen that ever peddled gin into a mining camp—get over the wall and throw a heavy sack he was carrying into a blackberry clump. We knew what the bag contained—salmon which he had cleaked, and for the possession of which he could be arrested if the keepers caught him.

Now my heart went out to Peter McCary, for, apart from his poaching tactics, he is one of nature's sportsmen, so when he hailed us we stopped. Peter managed to gasp out the information that he had fifty pounds of salmon in his bag, and that he knew the bailiffs were closing in all round him. "Jump on the carrier," I advised. "Get the salmon and your cleak. Pity to lose them."

It took Peter about ten seconds to obey, and away we whizzed for all we were worth. The old P. and M. took top gear in fine style in spite of the gradient and the heavy load, but next moment we caught sight of two more bailiffs running down the road towards us, and blowing their whistles. A side road on the right proved opportune, and we dodged up it with only eighty yards to spare. And so we saved old Peter by the skin of his teeth, winning his everlasting gratitude and the everlasting enmity of the water bailiffs, for which we did not care a jot as they are not likely to catch us poaching. It was all part of a glorious day's sport, through the memory of which beams the devil-may-care face of Peter. He had poached, and so, by George, would I had not fortune paved the way more liberally.

On one occasion, when there was game to carry, we took the body off an A.J.S. sidecar and rigged up an arrangement of poles on the chassis, but it was not satisfactory At each corner the poles sagged, and five or six rabbits embraced the rider lovingly round the neck. Finally he left them behind a wall, and that night a brace of wild cats held a carnival. Anyway, a sidecar will carry more game, properly packed, than any practical scaffold arrangement, and the balance is better. It would not be very difficult, however, to design a special carrier for this kind of work on something the same lines as the flat carts made for carrying game and sporting impedimenta.

And so the opening of another shooting season has gone by, its brightness only marred by the absence of familiar faces and the unspoken enquiry so often in our minds—"Will they all be back next year to hear the rustle of the brown leaves, and to scent the burning ling of dear old Scotland when the autumn days are still?" All—all! It seems a tall order. Mons—Soissons—Ypres! A thousand times more honoured is the place that awaits them when they return

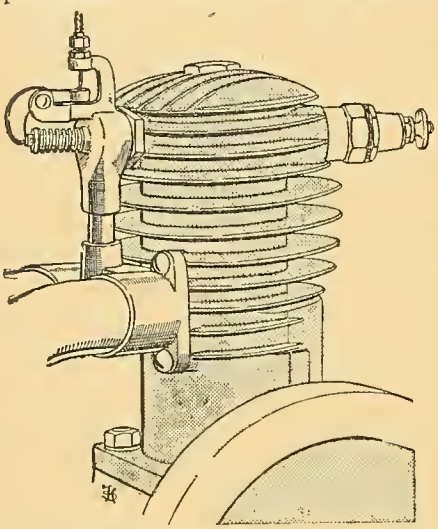
1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

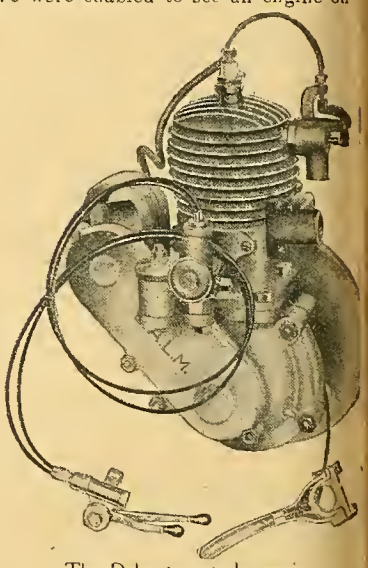
THE DALM TWO-STROKE.

AMONG the most interesting of the medium-powered air-cooled two-stroke engines the Dalm engine takes a high place. It is designed and manufactured throughout by J. C. Dalman and Sons, of River Street, Birmingham, and not the least wonderful point about it is the fact that no material alteration has been made to the original design. The cylinder has a bore and stroke of 73 × 76 mm., giving a capacity of 318 c.c. The transfer pipe is cast with the cylinder, and one of the first points to strike the eye is the great area of the exhaust ports, which discharge the gas into two separate pipes each of 1in. full inside diameter. The transfer ports also are of interest, for though the gas enters the duct by two large ports it is distributed over the face of the baffle by four smaller ones. A release valve placed in front of the cylinder is arranged, so that the gas is led directly into the exhaust box casting thus helping largely towards the ideal of a clean engine. The piston is domed somewhat less than is the case with the average two-stroke, but the baffle is extended somewhat above the dome so as to prevent loss of gas through the exhaust port.

It is interesting to note that both crank bearings and big end bearings are lined with white metal instead of the more usual phosphor bronze, and th large surface in conjunction with carefully ground crankshaft gives excell wearing qualities. The balance weig are carefully machined and riveted to crank webs. The "petroil" system lubrication is employed, the surplus pa ing through ducts to the crank bearin We were enabled to see an engine on test bench, and it was interesting to it started up by the simple expedient passing a rope round the belt pulley a giving a sharp pull. The engine evenly and emitted a clear clean exha The compression was excellent in spite the newness of the engine—a feat which is partly due to soundness of wo manship, and partly to the fact that th piston rings are employed.



The Dalm two-stroke, showing the two large exhaust pipes and the release valve connected to the port casting.

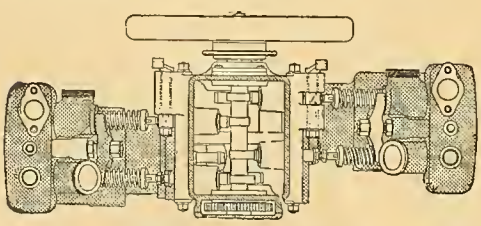


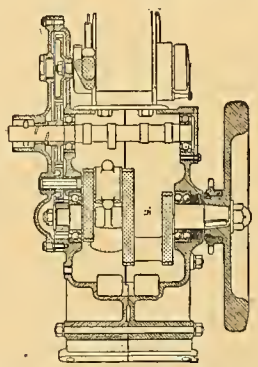
The Dalm two-stroke engine.

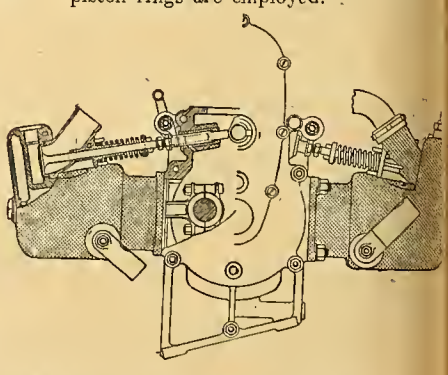
EDITORIAL NOTE.

ALREADY many full descriptions of 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions appeared:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Abingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	29th.	Calthorpe, Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2¼ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun-Vitesse, and Levis.
,,	19th.	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p. Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.







Three aspects of the new 6 h.p. horizontal twin-cylinder Humber engine. which was fully described in our issue of November 12th, page 529.

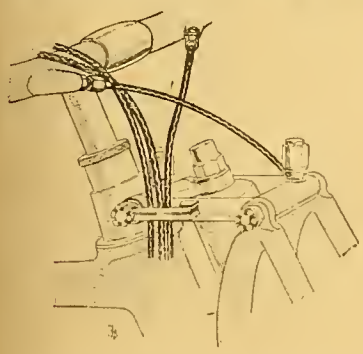
THE ALL-BRITISH RUDGE.

3½ h.p., 5-6 h.p. Single-cylinder and 7 h.p. Twin-cylinder Models, all embodying the Multi-gear.

LAST week Messrs. Rudge-Whitworth, Ltd., Coventry, arranged a press view of their 1915 model motor cycles, and, together with their pedal cycles, were able to make up quite a little show of itself, the new models in their resplendent finish being given quite a set off by the red baize on which they were displayed.

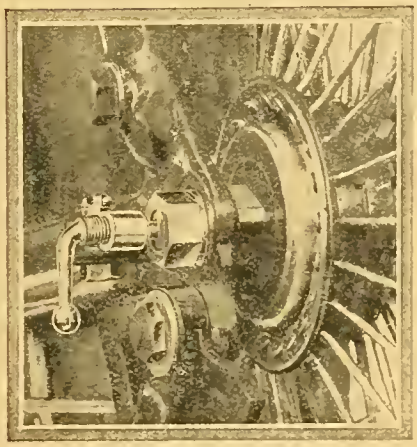
The new Rudges seem altered but little to a casual observer, though closer investigation reveals the master hand of experience at almost every turn. Trouble with a Rudge does not usually manifest itself on two occasions if the enterprising management can prevent it. They are not slow to profit by experience, and at once check any source of trouble by an amended design, or entirely new design, of part if deemed advisable.

The different models for 1915 remain as last year with the addition of the Rudge-



Spring fork grease cups and Bowden wire controls. Note adjustment for latter provided at forward end of handle-bar.

Multwin, which we described in detail during the summer. This model has, however, undergone several changes since last we referred to it. The magneto is now carried in front of the crank case on the usual design of bracket, provided with slots to take up any slackness in the driving chain. The sparking plugs are the Reflex, which are well spoken of, and they are placed in the centre of the cylinder heads. In connection with the crank case we noticed that a commendable attempt had been made to simplify cleaning, by making the exterior practically



A simple device for altering the position of the outer belt drum flange, and so adjusting the belt tension in a second.

smooth and devoid of the usual corners in which dirt collects. The halves of the crank case make a clean and flush joint. As regards the internal features, a flat topped piston is used with an obliquely cut ring, top and bottom and a deep recess between the upper and lower portions. This design of piston, it may be added, is common to all types. The forked connecting rod bearing has been slightly amended in design. The steel housing of the roller bearing is fixed in the double rod, the single rod working on the exterior of the housing. Several oil leads are formed.

The silencer is of very large capacity and placed under the bottom bracket. Separate pipes are used for each cylinder, and two outlet pipes of smaller diameter convey the spent gases to the rear. A new Senspray pilot jet carburetter with top feed to the float chamber has been adopted for this model, which allows this big twin to turn over smoothly and slowly. It is clamped to the inlet pipes so that ready removal is a feature.

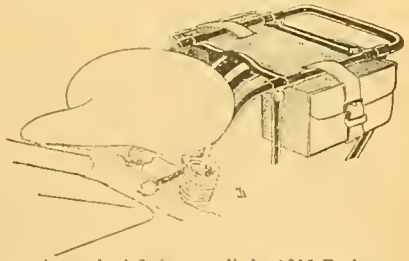
The engine is started by pedals connected to the half time shaft in the usual Rudge manner.

The Single-cylinder Models.

The other models are the very taking 3½ h.p. T.T. model (85 × 88 mm.) with sloping top tube—as natty a racer as was ever produced, and which scored a victory in this year's International T.T. race—a 3½ h.p. Multi roadster, and the 5-6 h.p. 85 × 132 mm. single-cylinder.

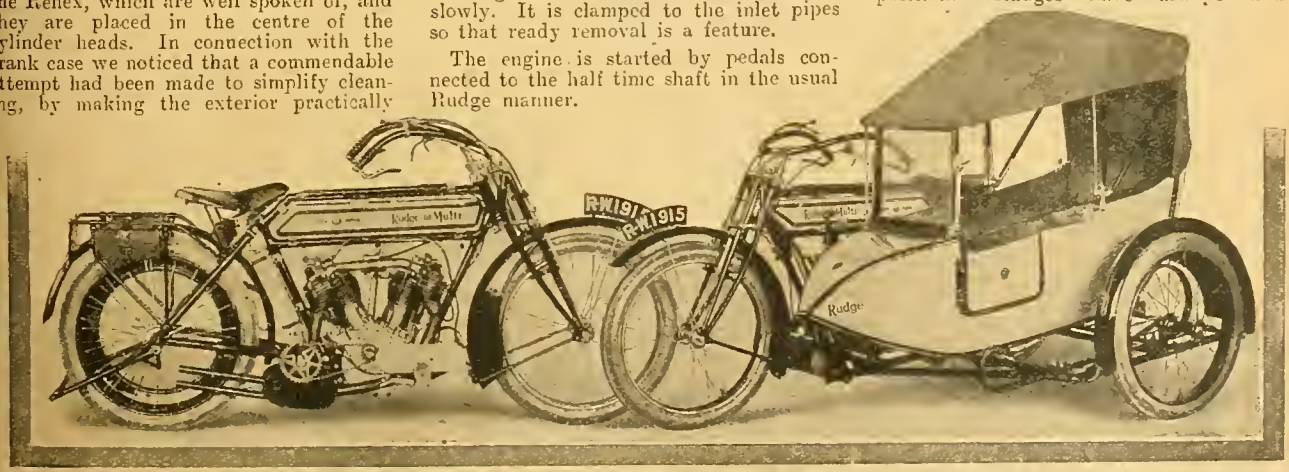
Free engine machines have given place this year to the wonderfully simple multi-gear. New features common to all the machines are spokes of 10 gauge (12 gauge was used last year), butted at both ends. Thus the points of contact when the gear is in operation have been greatly strengthened. The carrier is of stouter construction and has a couple of stays. A tray is formed on the top with extensions enveloping the tool bags and thus retaining their true shape. The spring forks are provided with greasers, having a hexagon head for the application of a spanner. Both these features are clearly indicated by the sketches on this page.

Foot operated pumps are worthy of attention, the pedal operating the pump by means of a Bowden wire being worked by the right heel. The oil compartment



A standard fitting on all the 1915 Rudges. The stout carrier has a neat metal top combined with the tops of the armoured tool bags.

is attached to the seat tube, and to prevent the security nuts coming adrift a wire is inserted through them. This practice we noticed had been adopted in several instances of important nuts in order to lock them permanently in position. Rudges have always had

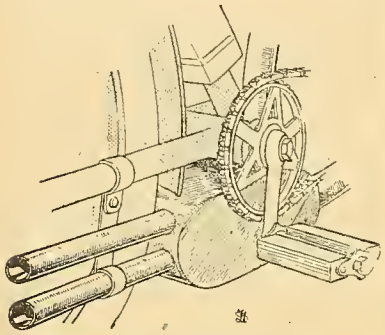


The latest 7-9 h.p. Rudge twin. Observe new magneto position and silencing arrangements.

A sidecar with hood and screen. It has improved upholstery and a polished aluminium panel in front.

The All-British Rudge.—

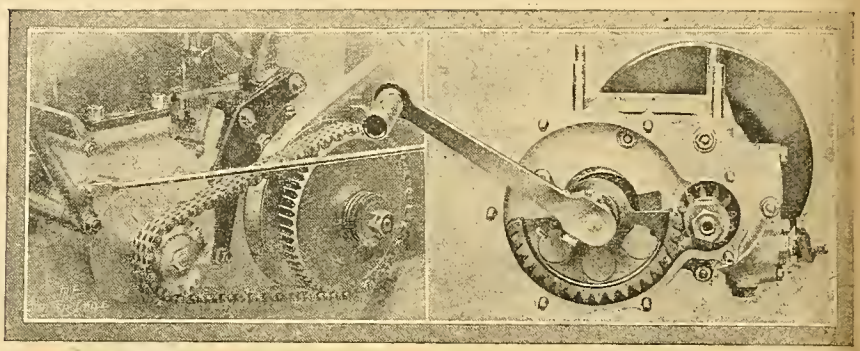
handle-bar controlled clutches and a powerful rear brake, which does not affect the ready withdrawal of the wheel. With the adoption of the C.A.V. magneto the 1915 Rudge is all-British—and a credit to its country of origin.



Large capacity silencer with double outlet pipes on the big twin-cylinder Rudge.

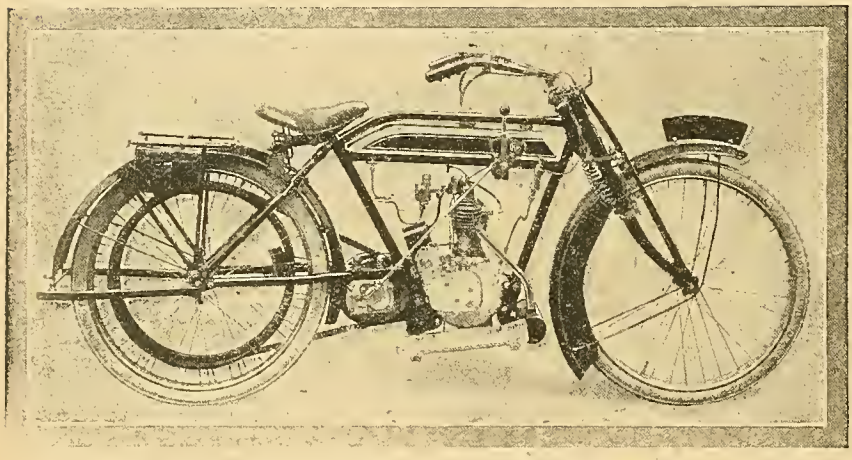
Well finished sidecars may be obtained fitted to any model Rudge. The spoking of the wheel is of the dished type with the flat sides of the spokes next the car.

The chassis is underslung, and a hood and screen may be obtained. The finish is either Rudge green and aluminium or dark green alone.



The 1915 Rover counter-shaft drive. The silent chain conveying the drive from the engine shaft to the gear box is shown on the left; the kick starter, shown in the second illustration, is combined with the gear box and is located on the other side of the machine. Of course both chain and kick starter are enclosed.

O.K. JUNIOR MOTOR CYCLES.

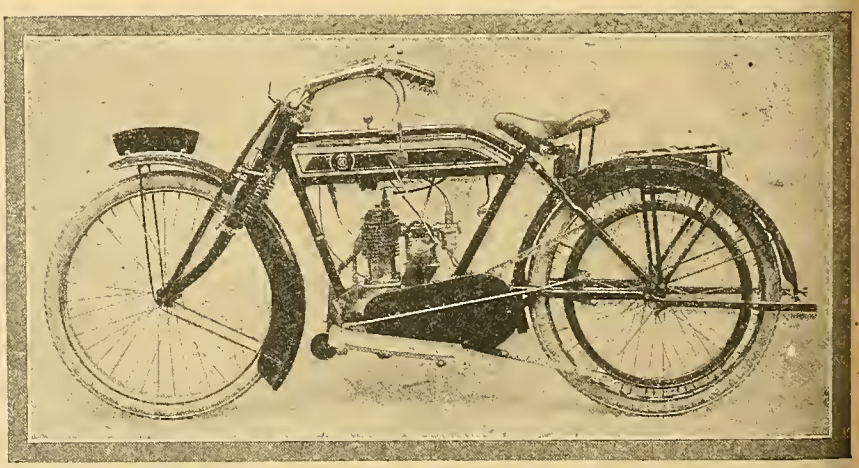


2 h.p. O.K. Junior, the engine dimensions of which are 58 mm. × 72 mm. As in the larger model, combined chain and belt drive is employed, and there are two speeds

MESSRS. Humphries and Dawes have decided to concentrate their attention upon one type of machine for 1915, viz., the lightweight. We do not mean by this that only one model will be marketed, for there are four in all, one of which will be fitted with a 2¼ h.p. two-stroke engine of 269 c.c. capacity.

The O.K. Junior Mark III. model remains much as it has been during 1914; indeed, it has given so much satisfaction that very little need for alteration has arisen. Still, it has been improved in many details. The engine is now bolted to the frame by engine plates, which also carry the footrest rods. The two-speed counter-shaft gear is operated by a lever on the right-hand side of the tank, attached, not to the tank, but to the tube below it. The engine is rated at 2 h.p., has a capacity of 190 c.c., and is fitted with an overhead inlet valve. As an extra, at a cost of £2 5s., a cork insert clutch, seven inches in diameter, is fitted in place of the ordinary chain wheel. This is operated from the handle-bar by means of a Bowden wire connected to a quick-thread screw; it is very flexible, and allows any amount of slipping. An improved chain cover has been fitted, which can easily be removed by undoing two screws only. The footboards have heel and toe pieces, and the inner sides neatly turned up. The brake can be applied without removing the foot from the footboard; this greatly assists in a gradual application of the brake. Other features are girder pattern forks, pan seat saddle, 26 × 2in. Clincher de luxe tyres, and a belt guard. The price of this model is thirty guineas. The same machine is supplied for ladies' use with an open frame at thirty-three guineas.

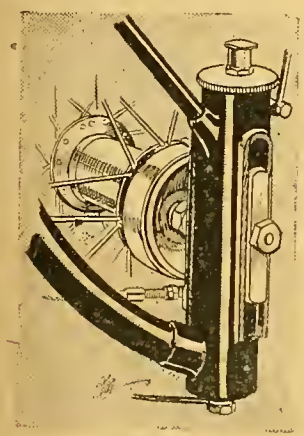
The Mark IV. machine is an entirely new model, having an engine rated at 2½ h.p., 70 × 76 mm. bore and stroke, 292 c.c. The bearings are of a special alloy of phosphor bronze cast under pressure, and the valves are made from the solid bar. Other details are as already described under Mark III. This machine retails at thirty-one guineas.



Left side of the 2½ h.p. O.K. The drive is by chain to a counter-shaft gear box containing two speeds, and thence by belt.

IMPROVEMENTS TO THE 2¾ h.p. WOOLER.

THE chief points of the interesting Wooler motor bicycle were recently dealt with in *The Motor Cycle*, but there has lately been a small but important improvement added to the engine. This consists of an extra port in the cylinder, connected by a short tube to the centre of the induction pipe. The main portion of the gas enters the cylinder through the automatic inlet valve. The rest of the gas left in the pipe, being at high pressure, rushes into the cylinder as soon as the extra port is opened by the piston, at the end of the induction stroke, after the inlet valve has closed by the action of its spring. The effect of the incoming charge at the end of the stroke is to ensure the cylinder receiving a full charge of gas; it also greatly assists in the scavenging. The makers claim that the engine runs cooler, gives more power, still maintains its slow-running properties without four-stroking, and is capable of a better speed on the level.

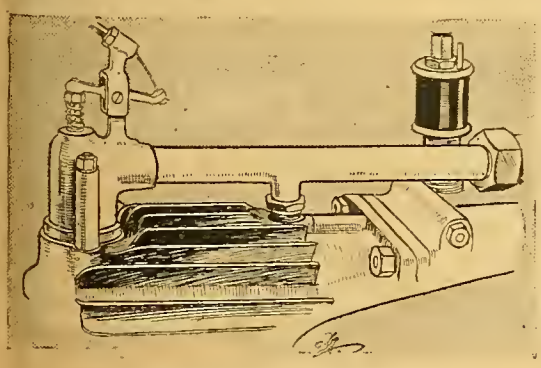


New band brake on Wooler front wheel.

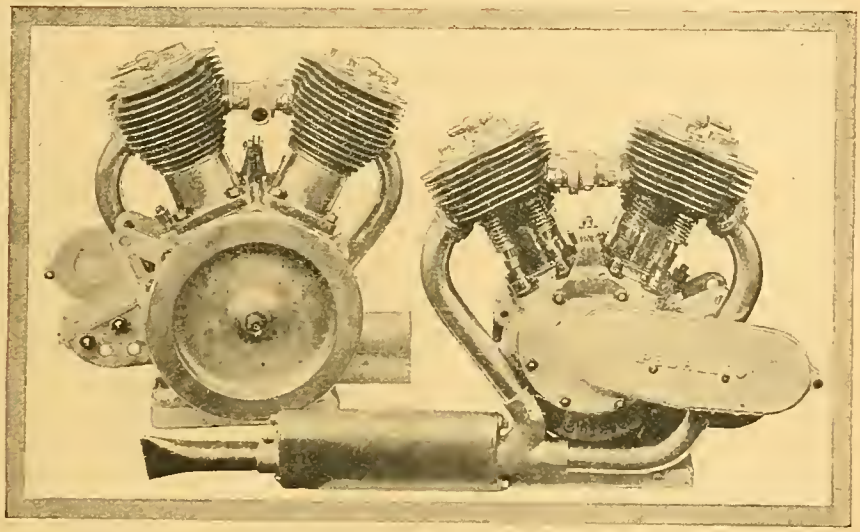
Other small improvements are the addition of a grease cup to the timing gear, the fitting of a belt guard, and an extra long exhaust pipe, which issues from an expansion chamber close to the exhaust chamber. Its extremity is fan-shaped, and saw cuts are made at intervals in its length.

Yet another alteration is the fitting of a band brake to the front wheel, which possesses the advantage of not interfering with the removal of the wheel.

The improvement in the engine to which we have referred certainly causes the machine to develop extra power, and in the course of a short run we were enabled fully to appreciate the flexibility, power, and silence of this attractive little machine.



Extra port to cylinder of latest Wooler



Both sides of the 4 h.p. twin Peerless Precision engine, showing outside flywheel and silencer.

NEW PRECISION ENGINES.

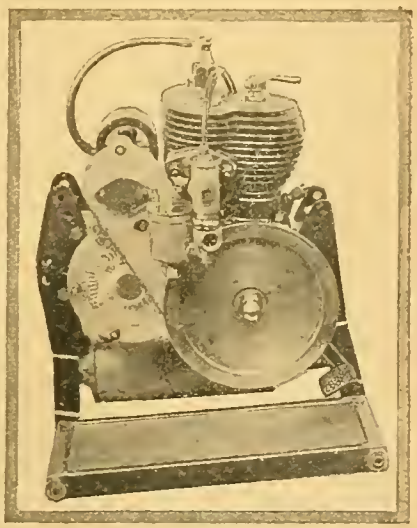
IN the August edition of *The Motor Cycle* Overseas supplement we dealt fully with the Peerless Precision twin.

At that time the makers were not prepared for the home market, but more recently it has been decided to supply the engine in this country under certain circumstances.

We may truthfully say that the engine is probably the finest production which has left the Precision works, and this is a high testimony to its design and manufacture. The engine has a capacity of 602 c.c. and is of the long stroke type (66 × 88 mm). Externally, the most striking features are the outside flywheel, side-by-side valves, and the domed cylinder casting. The usual Precision square radiating fins are replaced by the more conventional circular type. The valve gear is very well carried out, and neat adjustable tappets are employed. The exhaust lifter is operated by a fifth or central tappet, which can be depressed by a rocker, refreshingly stout in design. The construction of the big end is unusual, for a double row of roller bearings is carried on the crank pin. A steel sleeve in the forked connecting rod forms the housing, while the central connecting rod oscillates on the outside of the sleeve. The inlet pipe and exhaust pipe are held by flanges, the former being fitted with a neat expansion joint. It may be mentioned that the cylinders are interchangeable.

The overhead valve twin-cylinder engine is not quite such a novelty, as its forerunners made their appearance in the Tourist Trophy Races, and have since proved their worth in daily use and competitions. The engine is in every way suited for sporting mounts; it is also an excellent touring engine, being flexible and smooth running as well as being capable of high speeds.

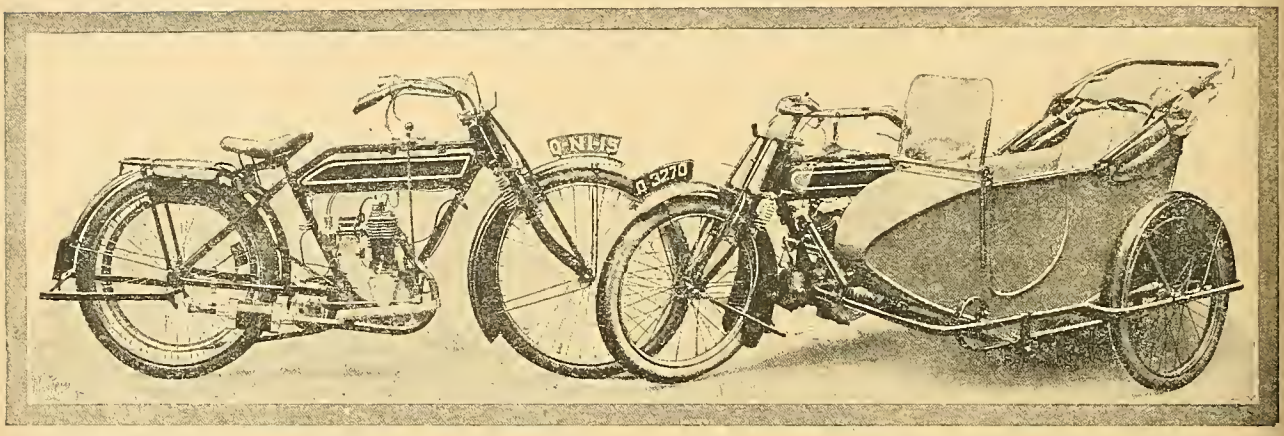
The chief change in the Precision Junior lies in the new cylinder and valve gear. The bore has been increased to 65 mm., the stroke remaining at 60. Both valves are now placed vertically behind the cylinder. The rest of the unit has been modified but slightly, and, in spite of the increased power, a considerable degree of silence has been attained.



1915 model of the Precision Junior engine, from the flywheel side

It is to be understood that these models are supplementary to, and, with the exception of the Junior, do not replace, present types. The big single is, of course, still a popular type of engine.

New Imperial Improvements.



New Imperial 2½ h.p. lightweight fitted with two or three-speed countershaft gear.

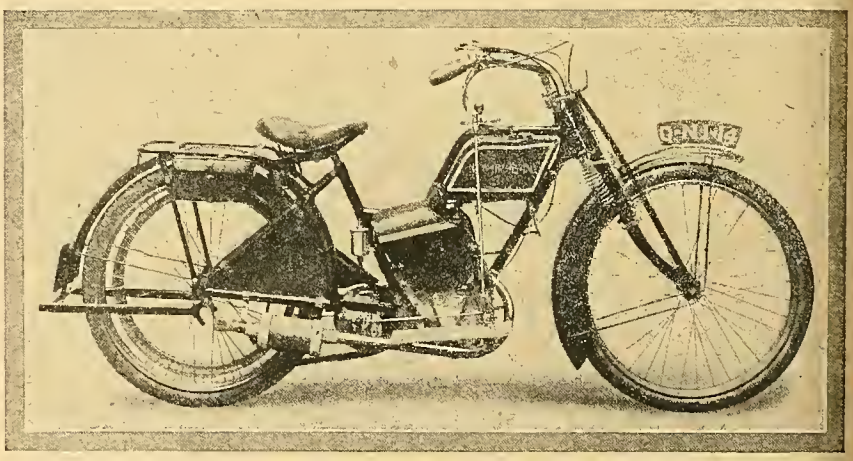
Sidecar combination made by the same firm, fitted with 6 h.p. engine and chain transmission.

WE illnstrate on this page some of the New Imperial models for 1915. The light tourist machine is fitted with a new pan seat, and several minor improvements have been made. Both mudguards are valanced and fitted to lugs to allow the wheels to be removed without difficulty. The rear brake is applied below the chain stay, and operated by means of a straight rod. The brake pedal is conveniently placed so that the rider can operate it without taking his foot from the footboard. The exhaust barrel is now oxidised, and the aluminium footboards improved. The two-speed model sells at 31 guineas, or with the addition of a clutch and kick starter at 35 guineas.

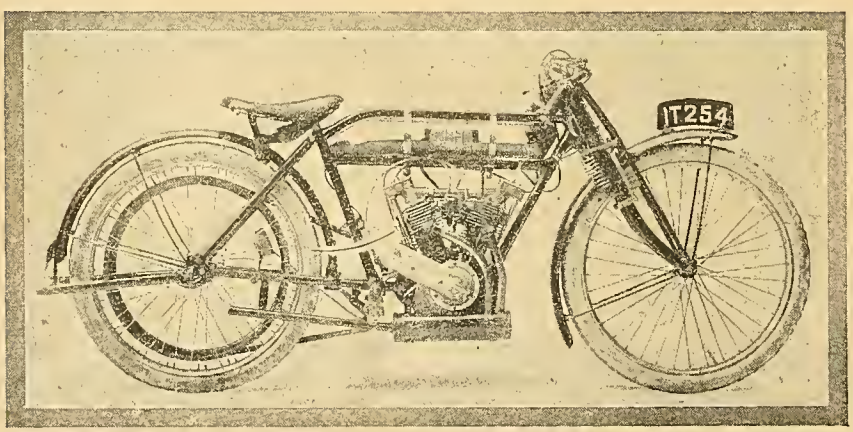
The specification of the ladies' machine is practically the same as that described, and it is supplied complete with clutch and kick starter at 36 guineas. Both machines are fitted with Dunlop tyres.

The sidecar combination has an engine of 76×85 mm. bore and stroke (770 c.c.), and is fitted with a countershaft three-speed gear and chain drive. Heavy Dunlop tyres are standard. The sidecar chassis has been dropped, and the lugs and joints reinforced at several points; it is attached at four points. The body is roomy, and is provided with a board in the rear for luggage. The combination complete retails at 79 guineas, but the machine alone costs £65.

In addition to these models, the company is also putting on the market a tradesman's light carrier machine. This is fitted with a 2½ h.p. engine, and designed to carry 1 cwt. of goods, though it is quite possible to take double this weight. The price will be 42 guineas.



Lady's model New Imperial. Note the dress guard which allows air to impinge freely upon the cylinder.



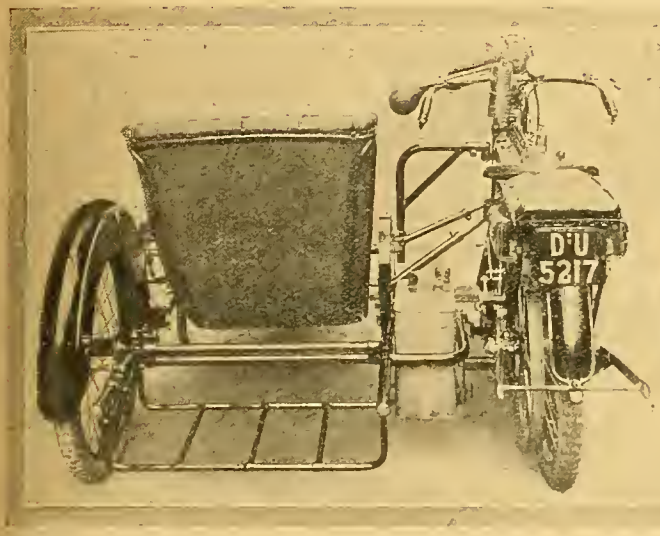
The new J.H. T.T. racer, which is fitted with a 3½ h.p. twin M.A.G. engine.

J.H. T.T. RACER MODEL.

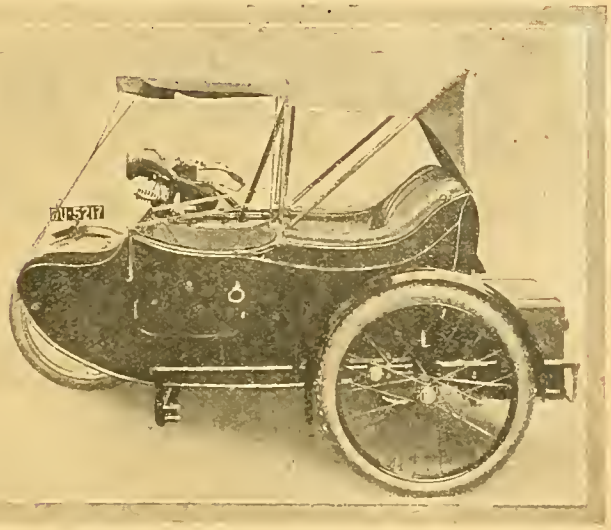
THE J.H. racer, of which we give an illustration on this page, is a very smart looking machine. The engine is a 3½ h.p. M.A.G. with overhead inlet valves, the mechanism of which is lubricated from the crank case through the tubes in which the tappets work. As will be seen, the magneto is snugly housed between the rear cylinder and the saddle tube. The silencer is capacious, and has a tube extended to the rear. The rear brake is operated by the left heel, and is applied above the chain stay—a position of great power. Brooks' saddles and Druid forks are fitted.

Other model J.H. machines have already been described in our issues of October 15th and 29th, viz., a 2½ h.p. two-stroke, a 2¾ h.p. single-cylinder, 6 h.p. and 8 h.p. twin-cylinder machines fitted with J.A.P. or M.A.G. engines.

LATEST GLORIA SIDECARS.



Double rear tube, tubular grid, and petrol can holder. The special attachments are clearly visible.



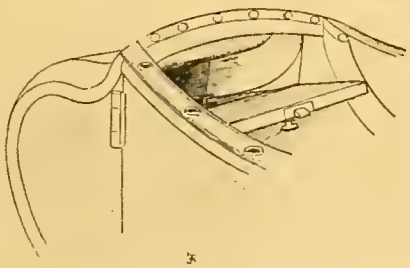
The No. 5 model Gloria with hood up. The adjustable screen is set in the normal position for a single passenger.

THE Gloria Co have established for themselves an excellent name for high-class sidecar manufacture, and their latest productions are in no way calculated to damage that reputation. Throughout the chassis there have been detail improvements, perhaps the most striking of which refers to the well-known Gloria double tube attachment, which is designed to distribute the strain between two of the cycle tubes instead of one only. The clips themselves are practically unaltered, but the actual attachment of the sidecar has been rendered much quicker and easier by the addition of vertical pivot lugs. Once the

Showing the adjustable Gloria wind screen in use as a reading desk.

clips have been permanently fixed on the machine, it is a simple matter to hook on the sidecar and lock up with a nut. The rear attachment is now provided with an adjustment for height, so that a 26in. sidecar wheel may be used with a 28in. wheeled motor cycle, or *vice versâ*.

The main rear tube of the chassis, which takes the chief strains, has been duplicated to prevent any chance of leakage, and the curved saddle pin fixing tube bas been replaced by a straight one.

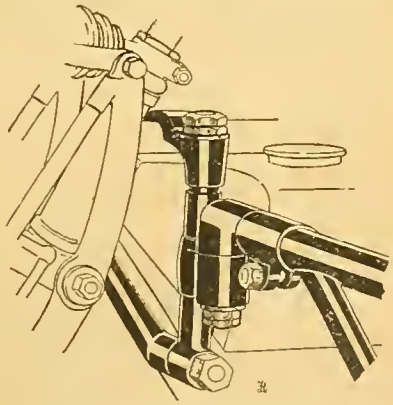


The spacious locker provided in the toe of the sidecar.

The front portion of the body is suspended on a cross leaf spring, shackled at both ends, which automatically adapts itself to the weight of the passenger. The bosses for the rear spring shackles are attached rigidly to the body. The tubular luggage grid has been strengthened, and the spare petrol tin carrying device improved. Incidentally, a simple device, consisting of a cross bar, the position of which is controlled by a wing nut, makes it possible to prevent all rattle from the spare can. The spring wheel is, of course, retained.

The body of the No. 5 model sidecar, which is mounted on this chassis, is a most refined production, having graceful lines and being beautifully upholstered with sprung seat and back. The tool and spare carrying accommodation is excellent, for, besides the large space under the seat, there is a roomy locker in the back of the body and a drawer in front of the passenger. The No. 5 outfit is a high class production selling at £25 without hood and screen.

The latest type Gloria screen is a most ingenious device which can be adapted in a few seconds for a single grown-up

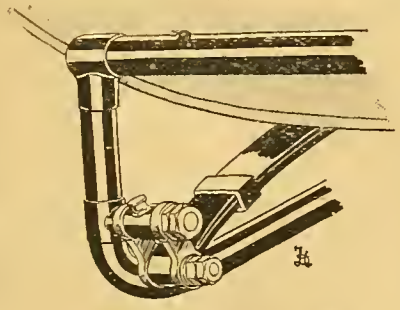


The latest Gloria attachment, which is considerably simplified.

person, a passenger and child, or even for use as a table or reading desk.

In all, seven models are listed, including the tradesmen's carriers described recently. The same chassis can be supplied with less expensive bodies in either cane or coach finish, and a somewhat simpler rigid wheel chassis is made with various forms of bodywork.

A very simple sprung child's seat can be fitted, which is easily adjustable for position or can be entirely dismantled and stowed away under the passenger's seat.

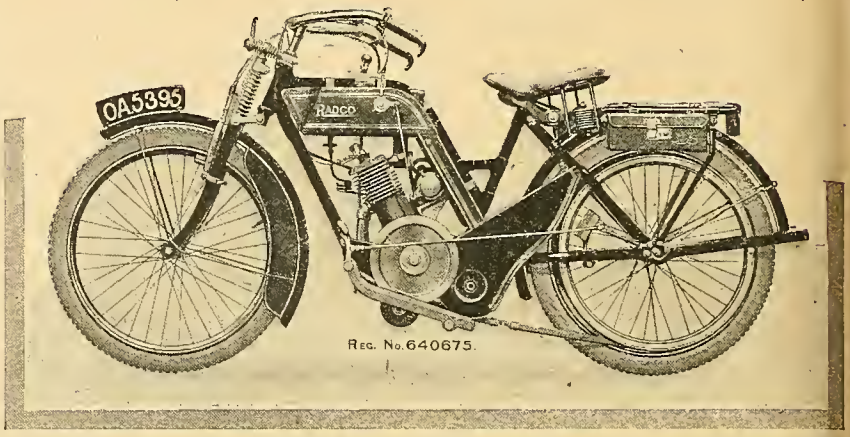


The shackled cross front spring.

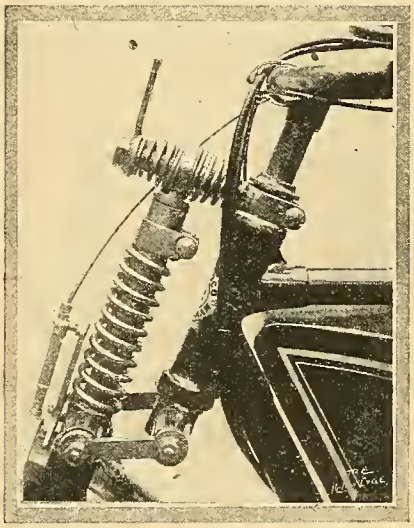
The Lady's Model Radco.

THE makers of the two-stroke Radco, E. A. Radnall and Co., Dartmouth Street, Birmingham, have standardised a lady's model for 1915. More than usual attention has been paid to the question of suitable dressguards, a feature being the guards placed at the sides of, and at right angles to, the tank.

The engine is a 2¼ h.p. single-cylinder two-stroke, the dimensions being 62 mm. × 70 mm. It remains practically the same as last year, minor detail alterations having been made which make it still more efficient. The principal alteration in the new models is in the front springing. Previously the spring forks had only given an up and down motion, but now a spring buffer is fitted which, in combination with the central upright spring, provides a double action.



Latest version of the Radco lady's model. The special dress guarding arrangement is referred to in the accompanying letterpress

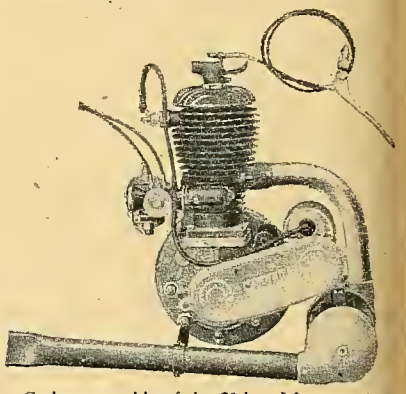


Supplementary spring fork on Radco allowing for lateral play.

The Albion two-speed countershaft gear is fitted, and this may be had, if desired, in conjunction with a free engine clutch. The price of the lady's model with two speeds is 32 guineas, and with two speeds and clutch 34 guineas.

1915 WULFRUNA.

Particulars of the Wolf machine were omitted from our Buyers' Guide owing to details not being available. There are four models of this machine: a 2¼ h.p. Peco-engined two-stroke, 62 × 69½ mm., 211 c.c., which sells at twenty-four guineas single geared, or thirty guineas with a two-speed counter-shaft gear: 2½ h.p. J.A.P. engine, 70 × 76 mm., 292 c.c., twenty-six guineas; with two-speed as above, thirty-two guineas; 4 h.p. J.A.P. engine, 85½ × 85 mm., 488 c.c., two-speed model forty-five guineas, three-speed model forty-seven guineas; 5 h.p. twin J.A.P., 70 × 85 mm., 654 c.c., three-speed counter-shaft and chain drive, sixty-two guineas. The two-stroke is fitted with a U.H. magneto, the rest with Splitdorfs. Senspray or Amac carburetters may be had to order.



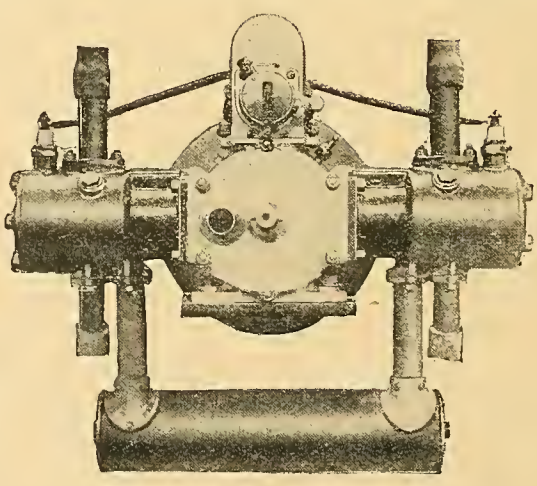
Carburetter side of the 2½ h.p. Metro engine of 70 × 70 mm. bore and stroke.

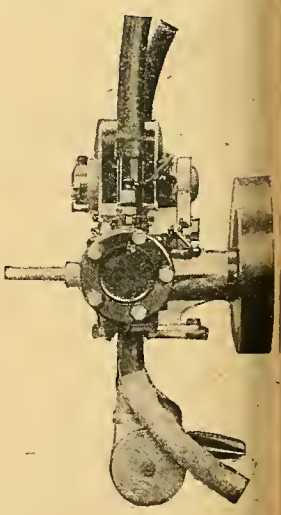
A Horizontally Opposed Two-stroke Twin.

READERS of *The Motor Cycle* will be interested to hear that a horizontally-opposed twin-cylinder two-stroke engine is now undergoing bench tests in the Midlands. The producer, Mr. W. H. Cuffin, of Grosvenor Works, North Evington, Leicester, is bringing forward the engine for cycle car purposes. The cylinders are water-cooled, and have a bore and stroke of 72 × 76 mm. The cranks are set at 180°, and consequently the balance is practically perfect, and both cylinders fire simultaneously every revolution. Gas is induced to the crank case through a rotary valve.

There are several special features in design, which will be dealt with as soon as the engine is in a rather more advanced stage.

In the meantime the behaviour of the Cuffin engine in a cycle car chassis will be looked forward to by many motorists with considerable interest.

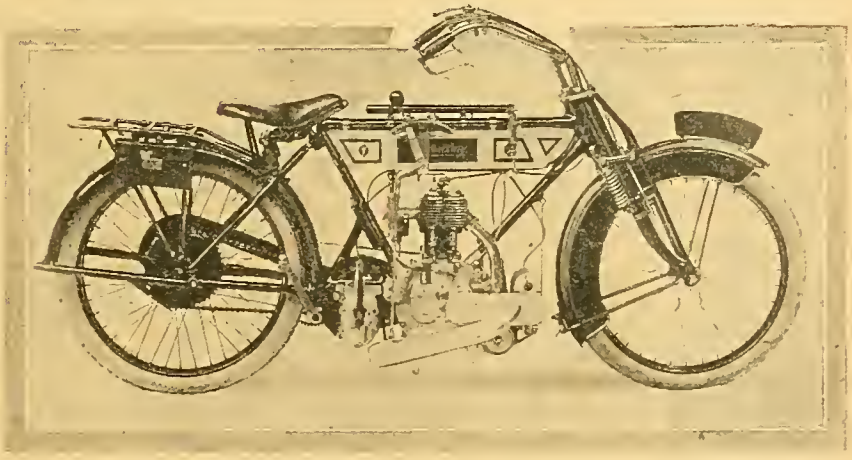




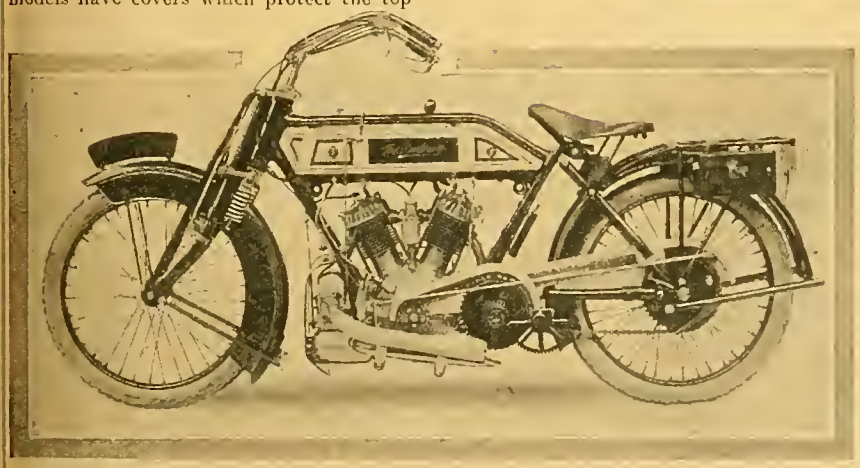
A CHAIN-DRIVEN BRADBURY.

THE 4 h.p. Bradbury can now be obtained with chain drive throughout, and a three-speed counter-shaft gear, which is mounted below the bottom bracket, and incorporates a kick-starting mechanism. The bolts which hold the gear box are allowed to slide in slots for the purpose of chain adjustment. The gear operating lever is mounted on the right-hand side of the tank in a convenient position, and clipped to the top tube. The clutch is handle-bar controlled by means of a Bowden wire. The well-known Bradbury method of combining the crank case with the frame is retained, and the latter is strengthened by a strut from the saddle tube to a point behind the gear box. The front mudguard is well valanced, and the rear guard has a small side flap, which will protect the chain to some extent from the mud thrown up by the wheel.

The chains of both the single and twin models have covers which protect the top layer of the chain and partially screen the inside of the chain links, but the drive is not totally enclosed.



The new 4 h.p. chain-driven Bradbury, with three-speed counter-shaft gear.



The 1915 model 6 h.p. twin-cylinder Bradbury.

The 6 h.p. twin machine, which we also illustrate, remains much as last year. The magneto is well protected by a metal guard and mounted just above the ample silencer, which has a pipe to the rear under the left footboard. The latter is of aluminium, and nicely shaped. The engine, which has detachable cylinder heads, is 74½ × 86 mm. bore and stroke, 749¾ c.c. There is an internal expanding brake in the rear hub actuated by a pedal applied by the left toe. The chain adjustment is very substantial in its construction. B. and B. carburetter and Druid forks are fitted to both models.

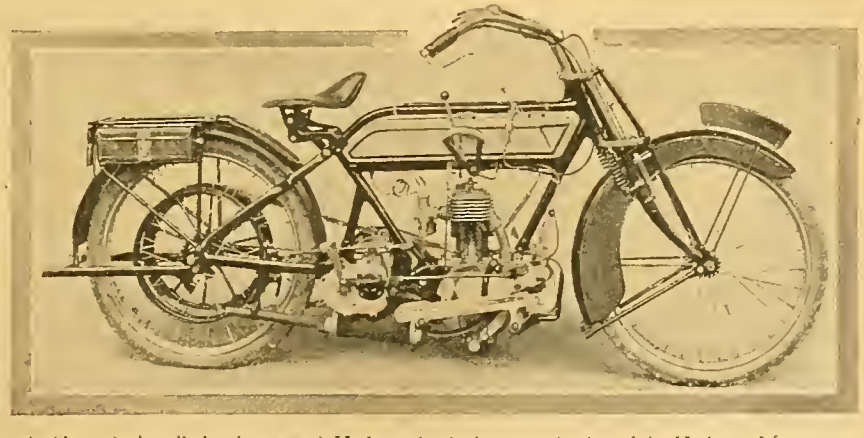
A third Bradbury is the 3½ h.p. horizontally opposed twin of 499 c.c., which is also supplied with a three-speed gear and chain drive. This should prove a very attractive solo mount, and be capable of drawing a sidecar if required.

A SINGLE-CYLINDER HAZLEWOOD.

INTEREST will be taken in the machine illustrated herewith in view of the fact that it is the first single-cylinder motor cycle to be built by the Hazlewood Company, of West Orchard, Coventry. This firm has hitherto specialised on big twin-cylinder machines which have justly earned a very good name for all-round excellence. Hence, it is not surprising to learn that the general design of the single-cylinder follows closely upon the lines of its predecessor.

The engine is a 4 h.p. J.A.P., 90 mm. × 93 mm. (592 c.c.). Drive is by an enclosed chain to a three-speed counter-shaft gear and thence by belt. The carburetter is a B. and B., and the magneto is placed in front of the engine on a platform, it being protected by a cover of sensible dimensions. The standard tyre fitting is the 26 × 2¼ Hutchinson.

A glance at the illustration will bear out our statement that the latest Hazlewood is a machine of taking appearance and substantial design. Another single-cylinder machine now made by this firm is fitted with a 2¾ J.A.P. engine and Sturmey-Archer three-speed hub.



A 4 h.p. single-cylinder three-speed Hazlewood—the latest production of the Hazlewood factory.

DAYTON LIGHTWEIGHTS FOR 1915.

Particulars of the Dayton machines arrived too late to be included in our "Buyers' Guide." They consist of the following: A 1½ h.p. two-stroke, 57×63.5 mm. bore and stroke, 162 c.c., fitted with Amac carburetter and 26in.×2in. tyres, £24 3s.; a lady's machine similar to the above with variable gear, £30: and a 2½ h.p. machine. 70×70 mm. bore and stroke, 269 c.c., Senspray carburetter, at £26 5s. The U.H. magneto is fitted to all models.

Our Equipment Number.

A particularly suitable Christmas present for a motor cyclist could be selected from the hundred and one accessories which will be dealt with in our special Equipment Number, to be issued on Thursday, December 10th.

M.C.C. Cinema Show.

To-morrow (Friday) evening the M.C.C. has arranged a cinematograph and lantern slide exhibition for the benefit of the Belgian Relief Fund, to be held at the Café Monico, London.

Another Substitute for Petrol?

According to the *New York Herald*, a new fluid to replace petrol has been discovered in America. It is stated that it can be made at a cost of ¾d. per gallon.

Its Composition.

The report continues that a small quantity of naphthalene is added to a large quantity of water together with two secret ingredients. The latter can be bought at any drug store. It will be interesting to see whether anything further is heard of it; in the meanwhile it may be added that the new fuel is said to have been tested on cars with very satisfactory results.

Speed of Despatch Riders.

In view of the recent controversy on the speed of military despatch motor cyclists in England, it is interesting to note that a rider summoned at Eastbourne on Friday last for excessive speed was let off, an officer stating that it was necessary that the riders should travel at speed. As intimated, the Bench decided not to convict, but said the police did right to bring forward the case.

Recruiting in Villages.

Over a score of sidecarists were present at a recruiting parade on motor vehicles through Warwickshire villages last Sunday. Over a hundred cars conveying a band and a company of khaki-clad men stopped at the entrance to each village; the soldiers, headed by the band, marched through, and at the other end of the villages the cars were occupied once again, and in a few minutes the same performance was repeated at the neighbouring hamlet. The demonstration was particularly impressive to us as showing the ease and rapidity with which a complete company of soldiers could be conveyed to any particular point on cars and sidecars.

Proposed Amalgamation of Liverpool Clubs.

It is not unlikely that the leading clubs in the Liverpool district will be amalgamated in the near future. Such a move, resulting in one powerful and influential body having a common interest, would, we feel sure, be of great benefit to the pastime.

How the War Funds Stand.

The totals of the principal war funds, as enumerated below, stood as under on Tuesday morning last:

	£	s.	d.
H.R.H. Prince of Wales's National Relief Fund...	3,907,000	0	0
H.R.H. Princess Mary's Fund to provide Christmas Gifts	95,300	0	0
The Times Fund for Sick and Wounded	633,399	12	2
The Queen's Work for Women Fund	91,580	7	10
Daily Telegraph Belgian Fund	70,290	12	0

Motor Cyclist as Engine Driver.

Another story illustrating the adaptability that the motor cyclist despatch rider displays is related by the *Daily Telegraph*. It was required to move a train of wounded out of the danger zone, but the driver could not be found. A motor cyclist at once volunteered, and he immediately jumped in the cab. The control arrangements of a railway locomotive and a motor cycle bear a very slight resemblance to one another, the result being that upon his first attempt the new driver found the train reversing in the direction of the firing line. Fortunately he managed to stop, and, "getting the hang" of the levers, drove the train out of danger.

British Success in Italian Race.

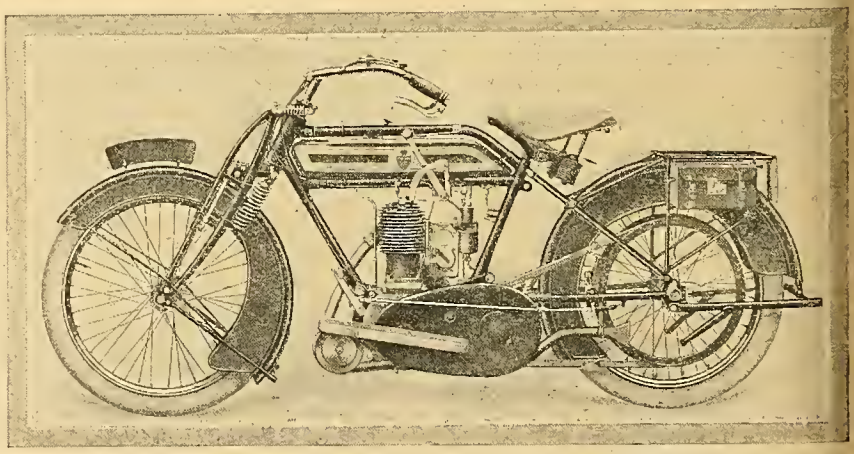
On the 25th ult. a reliability trial extending to 300 km. (approximately 186 miles) for the military championship took place over a very difficult course. Bersahliri Lampani, riding a New Imperial, gained the maximum award.

Club Finances.

So many motor cyclists having gone to the Front as despatch riders, certain motor cycle clubs are experiencing great difficulty in collecting sufficient funds to pay the big amounts representing affiliation fees due to the governing body. As a result, the resources of some clubs will be taxed to the utmost.

News from the Front.

The following are extracts from a letter received by Rudge-Whitworth, Ltd., Coventry: "Noble and I have covered many miles without any trouble. We have picked up another Rudge still, so we now have three. This one had a broken driving sleeve to the clutch when we found it, but our artificer made a new one. Our workshops are very good, with some clever fellows in them who can make almost anything. So far I have done about 1,500 miles in France without trouble, but plenty of gruelling. The roads are terrible, and *pavé* beyond description. We still continue to see sights and hear stories of awful slaughter and fighting, but I think we have just about got the 'dirts' on the run now. We have got quite used to shell fire and guns, and can sleep quite peacefully with awful dins going on. I met Glyn Rowden last night; he is driving a Wolseley ambulance. Pullin, Featherstonehaugh, Selwyn, Dug. Brown, etc., etc., are among others we have seen, too.—S. A. ROWLANDSON."



The 1915 model chain and belt-driven Rover with three-speed counter shaft gear.
(Described and illustrated in issue of Nov. 19th, page 565.)

Police Activity in Warwickshire.

The Warwickshire County police are again persecuting motorists for purely technical offences. This applies more to the neighbourhood round Coventry, such as Longford, Bedworth, and Berkswell.

A Motor Cyclist at Lord Roberts's Funeral.

Had anyone suggested ten years ago that a motor cycle would take a prominent part in a solemn pageant in the streets of London he would have been considered a lunatic. On the occasion of the funeral procession of Field Marshal Earl Roberts last week a motor cyclist despatch rider hurried down the route just as the body left Charing Cross and delivered a message to an officer on the Embankment. Apparently his mission was to acquaint the officer that the *cortège* had started, as the guns boomed out the moment the despatch was delivered.

Christmas Gifts for Despatch Riders.

Among the amounts received in reply to *The Motor Cycle* appeal for funds to provide Christmas presents for despatch riders at the Front was a money order for £5 from the Hamilton and District Motor Cycle Club.

An amount of three guineas was received from the Tyldesley and District Motor Cycle Club, per the hon. treasurer, Mr. Frank Peters.

As is well known, the fund introduced by H.R.H. Princess Mary has exactly the same objects as the fund we inaugurated, and we therefore recommend that subscriptions be forwarded direct to Her Royal Highness at Buckingham Palace. Envelopes should be marked "For the Sailors and Soldiers."

Mr. R. G. Lindsay, president of the Ulster Centre of the Motor Cycle Union of Ireland, acting upon our suggestion, has forwarded a donation of £2 to the Princess Mary Fund, and has requested that it may be specially devoted on behalf of the motor cyclist despatch riders at the Front. We are afraid, however, that such a wish, though well intended, is impossible for the administrators of the fund to carry out, as the despatch riders are so scattered about.

Certified Trials.

As mentioned in our last issue, the A.C.U. is now in a position to carry out private tests for both motor cycles and light cars under 1,100 c.c. The revised scale of charges, which has just been published, is £5 5s. per day for a certified trial of one, two, or three days' duration. The fees for tests extending beyond three days are proportionately lower.

Big Coats for Military Drivers.

We understand that the War Office are supplying every driver in the A.S.C.M.T. with a heavy fur-lined coat for winter use. It is, therefore, to be assumed that the claims of the motor cycle drivers will not be overlooked.

Well-known Motor Cyclist Killed.

D. M. Brown, of Douglas, Isle of Man, writing home from the front last week, announced that K. H. Clark (the James rider), who had taken part in several T.T. Races, had been killed in action. We extremely regret to record this fact, as Clark was one of the most popular competition riders in the country.

A Horse Shoe Competition.

The Roads Improvement Association, in conjunction with the Royal Society for the Prevention of Cruelty to Animals, lately organised a horse shoe competition with the object of producing a shoe which would damage neither the horses' feet nor the surface of the road. The judges state that no device was of sufficient merit to warrant the presenting of the £100 prize, but premiums were awarded to the three best designs.

When Will Controls be Standardised?

Our crusade on behalf of the standardisation of controls is fresh in the minds of our readers. Accidents, some of them fatal, have occurred from time to time which are directly traceable to the lack of uniformity of control levers fitted to motor cycles. The latest instance comes from Bedfordshire, where an accident occurred through the driver of a sidecar opening the throttle when he was under the impression that he was shutting it.

Export to Neutral Countries.

There still appears to be doubt in some quarters as to whether the export of motor cycles and parts to neutral countries is allowed, and we hasten to state that such is the case. There is nothing, for instance, to prevent manufacturers of English sparking plugs exporting their wares to Holland or Sweden.

A Thoughtless Suggestion.

A reader actually suggests that motorists should boycott all places where, since the outbreak of war, it has become customary to examine all licences. We are afraid we cannot offer any sympathy to our correspondent, as it is extremely important at the present time that every motor cyclist and motorist should be able to prove his identity. The examination of licences is no vexatious action taken by the police, but a useful check to find out if any alien enemies are using machines, which is now prohibited for very good reasons. Moreover, the law directs motorists to carry their licences on every occasion, and if they do not do so they must not complain if conviction is the result.

A.A. and M.U. Notes.

A Level Crossing Warning.—Some level crossings are being constructed across the Staines and Sunbury Road, about one mile out of Staines, and across the Ashford to Laleham Road at the points where the Metropolitan Water Board's Aqueduct crosses these two roads. Notice boards are erected to warn approaching traffic, but the Automobile Association would especially warn members of the great need for caution at night time.

Military Authorities and Driving Licences.—The Automobile Association warns motorists that, although non-production of driving licences is purely a technical offence, the magistrates are regarding the offence more seriously just now. Several military controls are on the roads requesting production of licences, therefore it is most necessary that these documents be carried.

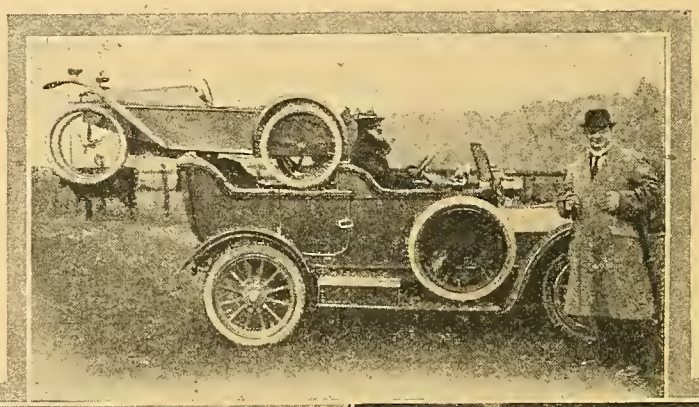
Motor cyclist scouts attached to the Armoured Car (Naval) Section waiting under cover. All the mounts are 2¾ h.p. two-speed Douglases.

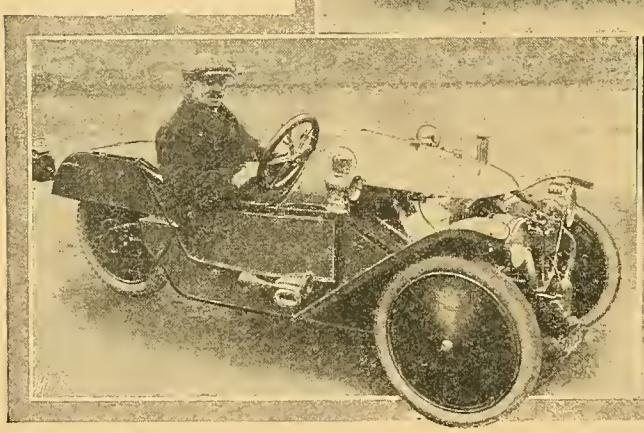
THE CYCLECAR CLUB'S RALLY.

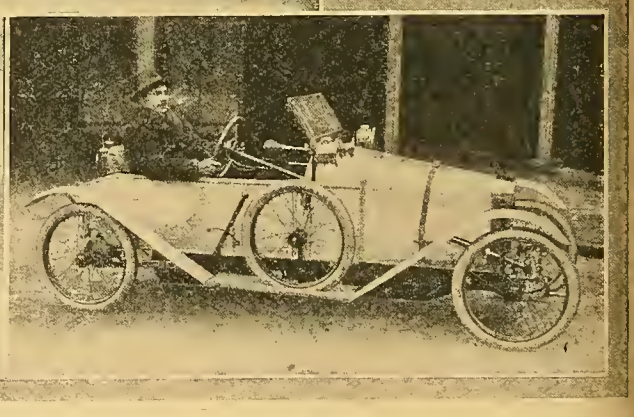
An Interesting Display of 1915 Model Cycle Cars and Light Cars.

DURING the week-end the Cyclecar Club held an interesting event, the object of which was to some extent to make up for the absence of a Show. A meet was arranged at the Red Lion Hotel at Hatfield, where the appearance of the competing vehicles was judged, followed by a run through Barnet and Finchley to London, and thence *viâ* the Portsmouth Road to Burford Bridge. Here dinner was followed by a concert. The next morning the machines were judged for the most novel mechanical feature, and after lunch a run was made to the Hut Hotel, where the final judging took place, the award going to the machine which had travelled the longest distance to be present. The judges were Dr. Low and Messrs. T. W. Loughborough and W. Cooper.

On Saturday the weather was fine, but dull and bitterly cold. The run from London was uneventful (our little Swift behaving in the most exemplary manner) until the outskirts of Hatfield were reached. Here two special constables and two of the ordinary variety stopped us with the object of inspecting our licences. They had a busy time, as there were about ninety competing cars, and nearly as many belonging to interested spectators.







(1) The Carden arrived in spotless condition on the back of a touring car.
(2) W. Cooper on a new racing Morgan with disc wheels.
(3) H. E. Dew on the D'Ultra cycle car.

When we arrived a goodly number of people had already put in an appearance. Their cars were arranged in the yard of the hotel, while the competing vehicles were parked in an adjoining field quite close by. It was not surprising to find that the majority were light cars which could in no way be described as cycle cars. It is our intention to deal with only those which more or less conform to that elastic term.

An Inspection of Cycle Cars.

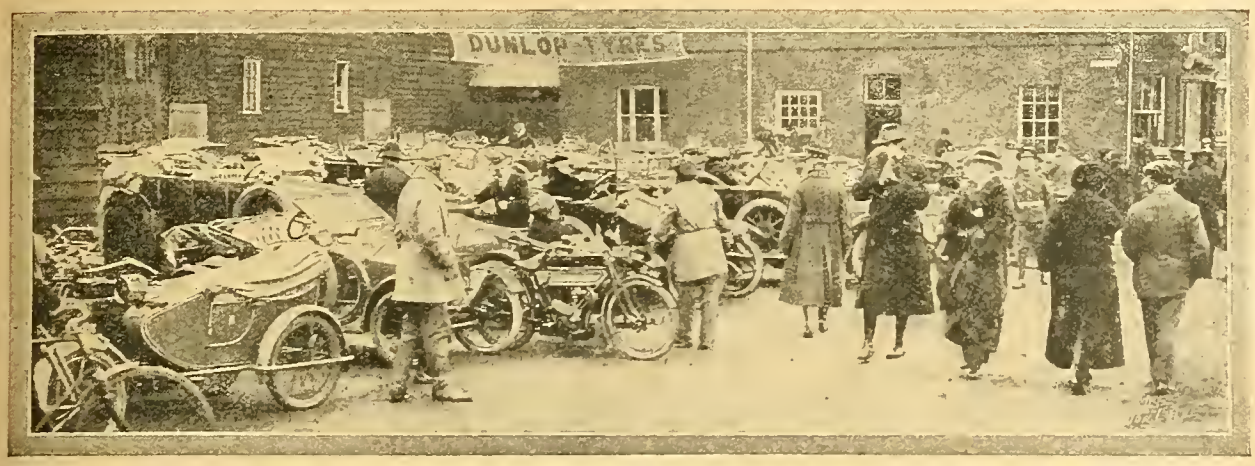
In the course of our tour round the line the first that we came to was the D'Ultra, built by the D.U. Manufacturing Co., Charlotte Place, Clapham, formerly known to our readers as the Dew. This, it will be recollected, is a light two-cylinder car, driven by a water-cooled V Chater-Lea engine, the power being conveyed in the first place through friction discs, and thence by means of a single chain to the back axle. We next came to the Kennedy, a more ambitious type of vehicle. This was fitted with a four-cylinder water-cooled engine (69 mm. × 90 mm.) of the *monobloc* type. A friction gear was employed, but the final drive was by belts. These, we understand, will in future models be enclosed in cases. The finish, design, and general appearance were most attractive. The machine is made by Messrs. Kennedy-Skipton and Co., Leicester.

Our attention was then attracted by the Victor, which has on several occasions been described in *The Motor Cycle*. Its chief innovation is the fitting of an extra contact breaker to the magneto, for a coil and accumulator, the object of which is to facilitate starting. We recently saw this device demonstrated with great success. A make the name of which is not at present well known to our readers is the Crompton, made by the H.D.C. Motor Co., 141, The Broadway, Hendon. It is a true cycle car, being fitted with a 5 h.p. J.A.P. motor cycle engine, the drive being by chain through a multi-disc clutch to a two-speed gear box, and thence by belts to the back wheel. Another car very much of the same type was the Aviette, made by Messrs. Hurlin and Co., 295, Mare Street, Hackney, the most distinctive feature of which was a pedal starter on the off side running board. A rather remarkable little car of the same size as the two to which we have just referred was the Winter.

A Four-cylinder Air-cooled Engine.

This was fitted with a four-cylinder Henderson engine, driving by chain to a counter-shaft, and thence through a two-speed gear box by belts to the back wheels. It was equipped with a change-speed lever placed horizontally on the floor boards, and a hand-starting device. The Morgans formed a very attractive display. W. Cooper's Grand Prix model fitted with disc wheels was a most handsome outfit, while we also noticed an ordinary touring Morgan which looked particularly smart. Another old friend was the well-tried and much appreciated A.C. three-wheeler, the only one of its kind present.

The most noticeable of the two Cardens was fitted with an M.A.G. engine, which was running very slowly, partly owing to the Binks carburetter with which it was equipped, while its silence, due to its enclosed valve gear, was quite remarkable. While the procession was beginning to leave



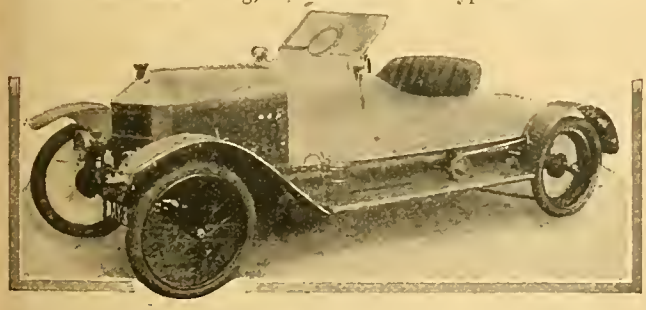
Motor cyclists and sidecarists were much in evidence at the Cyclecar Club's rally last week-end. The illustration shows a corner of the group outside the Red Lion Hotel, Hatfield.

Hatfield on its way towards the south, two H.S.M.'s were seen on their way to the exhibition field.

The concert after the journey from Hatfield was a great success largely owing to the fact that two Pavilion artistes (the Dulcet Duo), who were interested in light cars and happened to be passing, heard of the meeting, and gave a free performance, which was much appreciated.

At Burford Bridge, next day, we noticed one or two vehicles which had not put in an appearance at Hatfield. The judging for the most novel feature began at eleven o'clock and towards noon there was a huge crowd of cars and spectators. In fact one of the officials put the number of the former at 250 and the latter at from 800 to 1,000. Among the later arrivals were the Duo and the G.N.'s. The makers of the latter had brought down a new inexpensive model selling at eighty-eight guineas. In this the engine has the crankshaft set transversely in the frame, a disc clutch and a two-speed gear, the final drive being by belt as in previous models. After lunch, the cars were driven to the Hut Hotel, Wisley, for the final judging.

The day, though very cold, was delightfuly bright, and The Hut, always a pretty place, looked its best. Here the crowd was even greater than it had been in the morning, and the number of people was estimated at 1,500. The little vehicles attracted a great deal of interest, and altogether the meet was a most successful affair. A rather amusing feature of the event was the fear expressed by the Society of Motor Manufacturers and Traders lest it should assume the form of a show, and the participants had to evade the bond by labelling each car by name without mentioning the price. The awards will not be made until they have been submitted to the committee, but we understand, unofficially, that certificates will be granted to the following makes: For appearance (1) an open bodied Calthorpe of handsome design, (2) a blue coupé of the same make, (3) a Singer. For the most novel features (1) the Hortsmann. After these awards had been announced it seemed that the true cycle car stood a poor chance of appearing in the roll of honour, but happily, our surmises were wrong, as hereafter this type of vehicle scored.) Number three was the interesting Kennedy, which gained this place through the excellent design of its chassis. The award for the 1915 model which had travelled the farthest distance to be present at the finish of the event went, we understand, to the Morgan Motor Co.



The Kennedy belt-driven cycle car which is propelled by a four-cylinder water-cooled engine.

NIGHT TRIAL IN THE WEST COUNTRY

UNDER the circumstances, a total of twenty-five entries, which the Bristol Motor Cycle Club has received for its open eighteen hours' reliability trial, may be considered quite satisfactory. An interesting point is the number of passenger machines, both sidecars and cycle cars, there being only eleven solo machines.

The entries are as follow:

P. Grout (8 Morgan)	W. H. Rudge (3½ Wolf)
F. C. Wasley (8 Zenith sc.)	L. Martin (10 Singer c.c.)
A. Stevens (3½ Zenith)	H. N. Walker (2¾ Douglas)
W. W. Moore (4 Douglas sc.)	T. Heath (6 Sunbeam sc.)
C. E. Hokes (3½ Sunbeam)	G. Brough (3½ Brough)
D. Hawkes (10 Victor c.c.)	C. Hooper (10 Douglas c.c.)
E. Kickham (2¾ Douglas)	H. Petty (3½ Brough)
C. H. R. Norrington (6 Enfield sc.)	W. Egginton (8 Enfield sc.)
P. H. Mathews (4 Norton)	P. B. Phillips (2¾ Douglas)
A. L. Clayden (10 A.C. c.c.)	R. Davis (8 Chater-Lea sc.)
F. G. Ball (2¾ Douglas)	W. McKeggie (3½ Brough)
H. Greaves (8 Enfield sc.)	P. A. Stone (8 Morgan c.c.)
	M. S. P. King (10 A.C. c.c.)

The start is from the Queen's Hotel, Clifton, at nine o'clock to-morrow (Friday) evening. There are doubtless many readers who are desirous of seeing the competitors at some place *en route*, and so we give the course with the times at which the first competitor is due to arrive.

Clifton. First man starts 9 p.m. Friday.
Bridgwater. 10.42 p.m. Friday.
Porlock. 12.18 a.m. Saturday.
Countisbury.
Lynmouth.
Top of Lynton Hill. 12.54 a.m. Saturday.
Barnstaple.
Bideford.
Launceston. 1.40 a.m. Saturday.
Tavistock.
Ashburton.
Exeter. Arrive 6.36 a.m., leave 8.6 a.m.
Sidford.
Lyme Regis. 9.33 a.m. Saturday.
Bridport.
Dorchester. 10.45 a.m. Saturday.
Shaftesbury. 12.9 p.m. Saturday.
Frome. 1.21 p.m. Saturday.
Bath. 2.6 p.m. Saturday.
Bristol. 2.42 p.m. Saturday.

There will be timed checks at top of Lynton Hill, Launceston, Exeter (Bude Hotel), Blandford, and Bristol.

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

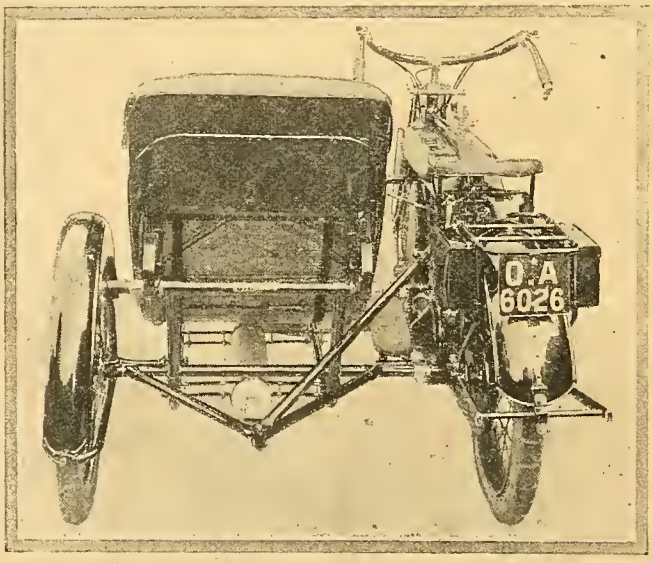
Petroil Lubrication.

Sir,—I have read with interest the letter from your correspondent, Mr. P. W. Hampton, in which he upholds the petroil method of lubrication. I have a Connaught single-speed machine which I always over-oil a little, but have never been perfectly satisfied with the lubrication, for this reason: When running down hill with throttle nearly closed, the engine gives a curious "scraping" sound (not a "knock" by any means). The result of this is that the engine gets hot before the bottom of the hill is reached. This can only be caused by lack of lubrication. If Mr. Hampton will try the above experiment he will find that the petroil method has its disadvantages. W. EDNER.

Delivery Tune.

Sir,—In a recent issue, "Ixion" appears to be needlessly apprehensive over the effect of his repeated criticisms on the delivery tune of motor cycles. Far from being tired of the subject, I fancy that most readers of *The Motor Cycle* would desire him to be even more explicit. Personally, I have no grumble, as the two machines I have had—a Grandex-Precision and a Scott—were delivered in first-class condition, and required no adjustment of any kind.

After running the Scott for 2,300 miles a curious mishap befell me a fortnight ago. When about to enter a garage there was a slight crack. Investigation the next morning showed that the crankshaft had been torn clean in half. A metallurgist and engineer, after examination, declared the metal to be perfect, and could give me no explanation as to the cause of such an extraordinary accident. In order to get the damage repaired I took out the engine and sent it to the Scott Engineering Co. Their expert has also been unable to account for the breakage. As my guarantee had expired I made no claim on the Scott Co., but they made no charge for the repair. LEWIS E. RUSSELL.



The big single James sidecar outfit (back view), showing silencer under seat and sidecar chassis design.

Why an Engine Konks.

Sir,—I have read with great interest the letter of Messrs. Lodge Bros. on engine knocking, and agree with them that Mr. Watchorn's point is not the prime factor, and in the case of an engine having excessively loose piston (and bearings) the rattle set up is of a very different order from the tune of a professional konker.

Another point in support of this view is that metal (iron in particular) can be made to emit noises without the application of any external mechanical forces or moving parts whatever. The well-known hum of a transformer, not to mention numerous other H.C. and three-phase machines, is interesting in that the forces acting on the molecules of the metal are considerably smaller than the stresses attained by pre-ignition. EO 293.

Sir,—After reading the article, and the several letters in reply, on the above subject, the real reason for konking seems to me to be as far away as ever. From my own experience, I have traced the position where the konking may occur, but I cannot explain just exactly how it occurs.

I have acquired the habit of driving entirely on the throttle, except in cases of emergency. I also always use top gear until it is absolutely necessary to change down. (This may, or may not, be a bad practice, but I find it a considerable saving in petrol consumption over driving on the exhaust or constantly changing gear.) Consequently, in slowing down to round sharp corners, I am quite accustomed to konking. While driving in the dark, under such circumstances, I have frequently noticed a distinct spark or flash occur, as near as I could judge, between the exhaust tappet and the valve stem, simultaneously with the konking. I do not know if two *similar* metallic surfaces striking violently together, under any circumstances, can produce a spark or not. For obvious reasons, I could not minutely examine the point mentioned to ascertain the exact nature or cause of the flash, with the machine still in motion on a dark road. One might say that this flash could be caused by a portion of the exploded gas escaping down the side of the valve stem which did not fit well in the guide; but in this case the flash would be noticeable on *every* exhaust stroke, whether the konking occurred or not. I can, however, say that I have noticed the flash *only* in conjunction with the konking.

If this subject is followed up by your readers I shall watch it with keen interest. D.D.D.

Sir,—I would like to reply very briefly to a few points raised by your contributor on the question of engine knocking and pinking.

I think it is not easy to quote examples from different types of engines as regards degree of knock. One might immediately remember the example of the one hundred mile an hour Talbot, which was extremely ordinary in combustion chamber shape, and yet under the most adverse conditions was not greatly troubled by knock. I do not quote this as an example, but merely to point out that examples are of no great value.

Mr. Watchorn states that there is very little more knowledge left to be discovered on the subject of internal combustion engines. In my humble opinion the boot is on the other leg, and there is not much that *is* known about them definitely. The fact that this type of prime mover was discovered one hundred years ago is no argument at all, because the turbine in principle was in use at the time of Archimedes, and yet now is *far* from being "completely

understood." Noises in all types of gas engines do not as a rule consist of any particularly definite type of sound, and, however closely the running of the engine is watched by indicators and the knocks examined by a sonometer, it is not often easy to obtain any definite relation between the two instruments, neither is it easy to tell where one noise commences and another ends. Most noise is composite in nature.

Mr. Watchorn would have us believe that the particular "konk" which so often causes trouble is due entirely to translation of the exploding gases. Konking can often be cured by a liquid stream of water injection; also the variation of plug position will not cure konking by giving what your contributor imagines as a direct push; and, what is more, an examination of the pressure by means of a manograph on both sides of even a large cylinder does *not* show a lag or translation of pressure or temperature large enough to cause any effect such as he refers to.

I have no doubt that Messrs. Lodge Bros. will confirm this point, which I have frequently checked by experiment, and I might say I think that their explanation, in conjunction with the various mechanical sounds due to the give of metals and taking up of unlubricated places, is frequently correct. I have made many examinations of different forms of knocking sounds by measuring the varying electrical resistance between bearing and shaft, etc., and during many forms of knock and konk one can only see the transmitted current rapidly rise in conjunction with a rapid rise of pressure during a small degree of piston motion on one's manograph

I have made the experiments referred to with movable heads fitted with pockets in different positions in conjunction with multi-cylinder two-stroke engines, and I must say that I have been unable to get the effect referred to by Mr. Watchorn to any reasonable extent.

I certainly consider his suggestions of interest from some points of view, but I do not think that one can sweep out the ground with the ease assumed.

A. M LOW, A.C.G.I., D.Sc., etc., etc.

Sir,—I have read the article and correspondence on this subject, and note that, although all the writers criticise your contributor rather severely and perhaps justly, none actually explains what causes the phenomenon. Now, I do not profess any deep technical knowledge as to the actual cause, but I have a theory based on observation, and I imagine the suggestion made in Messrs Lodge Bros. and Co.'s letter is nearer the mark than any of the others. The noise produced by suddenly shutting a tap from which water is flowing under considerable pressure is, I have always understood, caused by the sudden arresting of the flow rebounding along the pipe. The pressure of ignited gas in process of expansion is analogous to a fluid pressure, and if the charge be fired even a fraction too early, the flow of its expansion is arrested against the ascending piston or even against the piston while in a stationary position on the exact dead centre of the stroke.

When the charge is ignited at the correct fraction of a second to produce a pressure on the descending piston, the gas is expanding freely, and no rebound occurs, and consequently no "konking."

That is my theory, and I think it explains why an engine which is provided with too high a compression knocks itself to a standstill when driven hard. COMPRESSION.

Some Two-stroke Tips

Sir,—As a regular rider of and agent for Levis two-strokes, I should like to take exception to some of the remarks in your article, "Some Two-stroke Tips," as being entirely inapplicable to the Levis machine, and calculated to give a wrong impression of its performance as a two-stroke.

To my mind the troubles seem to come entirely from one source, viz., petroil lubrication.

Now, in the Levis, the lubricant is led to precisely the spot where it is required to do its work instead of being splashed all over the internal economy of the engine in the hope that some portion, at least, of the oil will find its way to the required place.

Although when driving a new machine I lubricate plentifully, and for the first 500 miles or so keep the engine smoking practically continuously, I have yet to have my first stop for a sooted plug, and I know of customers who have done distances of over 2,000 miles without touching the engine or its accessories for any purpose whatever

It will be found occasionally, if the gap at the plug points is on the small side, that it becomes bridged across by a minute filament of metal, after a run at speed, due, no doubt, to the excessively hot spark produced by the magneto at high rotational speeds, which certainly does cause misfiring, but can be cured by widening the gap.

There is no doubt that, although the petroil system may be cheap and handy, its virtues end there.

A.M.I.E.E.

Oildag.

Sir,—Perhaps my experience with Messrs. Acheson's Oildag may tend somewhat to allay "H.W.K.'s" fears as to the advisability of continuing its use. I have used Oildag in my J.A.P. engined Morgan for a distance of about 7,000 miles and have derived the following advantages from its use:

1. The engine does not gum up as much when standing, and is, therefore, easier to start from cold without priming.
2. Reduction in carbon deposit. I run about 3,000 miles before dismantling cylinders, and then find only a very small amount.
3. 50% reduction in oil.

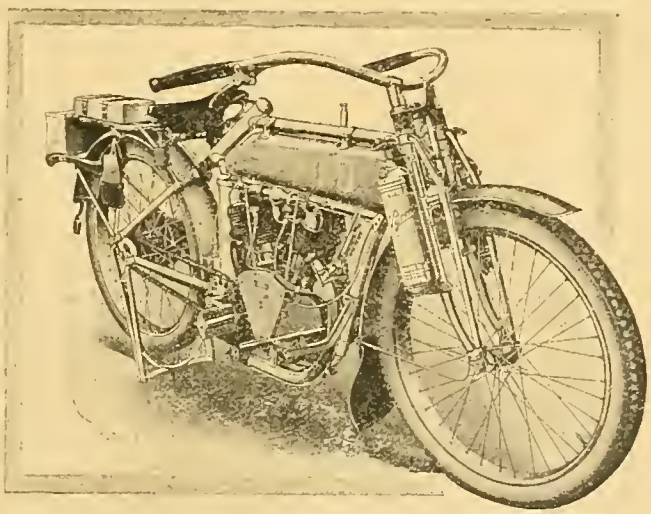
Before using Oildag I gave a pump every five miles, and if I missed a charge the engine soon reminded me. With Oildag I give one in ten, and the engine certainly does not appear to miss a charge as much now as it did when I oiled one in five without Oildag. With regard to wear on bearings caused by its use, I can only say that when last my engine was dismantled there was no undue wear in any of the engine bearings. W. J. VICKERY.

Overheating of Motor Cycle Cylinder.

Sir,—At the beginning of this year I purchased second-hand a 3½ h.p. three-speed sidecar combination. Whether or no the "load" was more than the engine was intended to pull I cannot say, but on every occasion when out for a ride I was troubled by the overheating of the cylinder.

At the beginning I attributed this to my lack of experience in driving, etc., but found that more experienced riders had, with my cycle, the same difficulty. The advice tendered, in books and by friends, was tried, but proved, in my case, unavailing, and as a last resort I determined to adopt a suggestion, namely, that the "grooving" of the piston rings might be of advantage.

I had this carried out, and since then have had no trouble whatever from the above cause. My engine not only keeps cooler, but, probably as a result of its coolness, pulls much better. As the remedy seems to me to be a new and unique one, I thought I would like the opinion of other readers upon it FRED WARBURTON.



A specially-equipped motor cycle for service in an American fire brigade. It will be noticed that, in addition to two fire extinguishers on the forks, a hatchet and surgical appliances are carried at the rear. The machine itself has an exhaust whistle

Standardisation of Controls.

Sir,—May I, through the medium of your columns, express my opinion on the above interesting subject. Whilst I greatly favour the handle-bar control for both carburetter and magneto, as suggested by your correspondent, A. Statham, I must say my views of the clutch control are quite the opposite to his. I think the foot-operated control for the clutch is the ideal control, especially in traffic; for, what with the carburetter, magneto, exhaust, horn, and the change speed, combined with the steering, a rider in traffic will find the foot much easier to use, instead of adding to what at present, I think, is quite a handful.

CHARLES BURKE.

Mudguarding.

Sir,—As a patentee of devices to improve the cleanliness of motor cycles, I have read with interest "Ixion's" remarks upon weatherproofing. He states, "It took me three hours to get my mount and my clothing really clean that night because I could not apply a hose." I ask, why apply a hose, especially to oneself? The proper place for mud is on the road, not all over the machine and rider. Obviously, wheels revolving in mud must throw it far and wide, and if it is wished to restrict its damaging effect it must be confined to the wheels by mechanical means and conducted back to the road. With a single track vehicle like the motor cycle the engine and rider are placed in the position to receive the whole of the bespoiling mud put up by the front wheel. With the back wheel the machine runs from the mud thrown, and beyond the spray thrown getting upon the rider's back and hair, choking the carburetter and causing belt slip, no mischief occurs. Perhaps this is enough.

The writer went through "Ixion's" experience years ago, and came to the conclusion that there was but little pleasure in a fifty-mile ride with three hours' labour at the finish, and, as the time of year producing the muddiest roads is when the country side is at its best and riding most invigorating, therefore not only enjoyable but beneficial, the necessity of efficient mudguarding was made clear.

Four years' work since, with 10,000 miles testing, has produced three patents giving the weatherproof machine—that is, a machine on which one can ride a hundred miles in any weather to a friend and enter his house by the front door at once. This is only got by departing from pedal-cycle mudguarding made a trifle larger, as generally used by motor cycle manufacturers. The motor cycle now, with its great pace, is far removed from the pedal-cycle, and nothing but radical alterations can give cleanliness.

One point is of the utmost importance. Forks must be made wider, and the back stays also, to permit mudguards to pass, giving an inch clearance each side of the tyre.

F. WAIGH.

An Appreciation of a Heavyweight.

Sir,—As one rarely, if ever, sees any article published on the heavyweight motor cycles of the present time, especially as solo machines, I feel that perhaps the experiences of, and the data gathered by, a rider of such a machine might be of interest to readers of your paper.

The machine in question is the 8-10 h.p. two-speed, four-cylinder Henderson. This does not pretend to be anything but a heavyweight, and therefore nothing has been taken from the design of any part to reduce weight; consequently, each piece is amply and solidly made, thereby absolutely eliminating all those annoying rattles, and the continual necessity for adjustments, so prevalent on many modern machines.

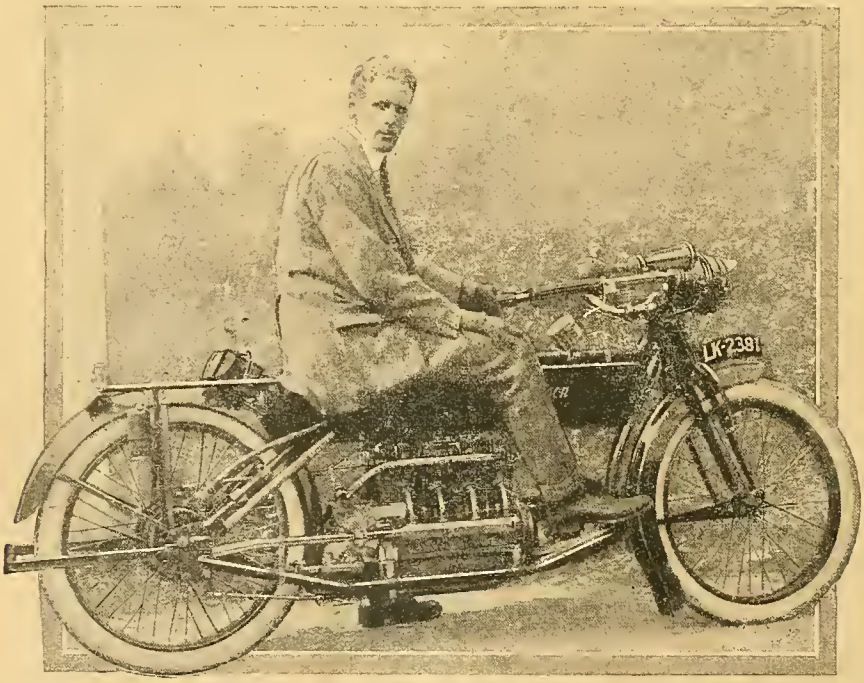
The most wonderful part of the machine, however, is its balance. The moment it moves, even at two miles an hour, the rider can put both feet up and carry out any manœuvre he wishes without the least difficulty, the engine turning over evenly and quietly. It is no exaggeration to say that, with the exception of reversing, a rider of a Henderson can do anything that a high-powered modern car can do, either running slow through traffic or at high speed in the open.

The machine which I have, and ride solo, was bought by me this summer. It has now covered over 2,000 miles, and up to date has not had one involuntary stop on the road, nor has it cost one penny for repairs or replacements of any sort. I have kept a careful account of every drop of oil and petrol used since the first day I used it, and the result works out to the consumption of eighty-nine miles to the gallon for petrol, and one thousand two hundred miles to the gallon for oil.

The machine is geared 4½ to 1 on top gear, and on this will run at seven miles an hour with throttle closed, and sixty-eight miles an hour with throttle open. From a standing start it will accelerate to sixty-one miles an hour in two hundred yards without being forced, and will take Westerham Hill on top at over fifty miles an hour, or at fifteen miles an hour if wished. I only use the low gear for dead slow running in emergency, and have never found any main road hill which it will not take on top gear, even at slow speed. Recently I had the engine entirely down for inspection and cleaning out carbon, and found every part inside in perfect condition with no sign of wear. I have had the valves out twice for inspection since I bought the machine, but in neither case did any of them require grinding.

As to the usual idea that an air-cooled four-cylinder engine overheats, I may mention that I have never had this occur. Moreover, the nickel plating of the cylinders of my machine is still white and not even discoloured. Another point in favour of the Henderson is its extreme cleanliness, the engine always looking bright and smart, and the entire absence of creeping or dripping oil on the crank case being very noticeable. With a good fitting tyre security bolts are quite unnecessary, owing to the even turning effort of the engine, and 5,000 miles should be quite an average for a good back cover. Taking all the above-mentioned points into consideration, I think that the most critical person must admit that the initial price is not unreasonable.

P. F. W. BUSH.



P. F. W. Bush, a heavyweight enthusiast, who relates his experiences with an 8-10 h.p. Henderson for the benefit of readers.

Removing Flywheels.

Sir,—A useful Douglas tip from Mr. A. V. Hughes appears in your November 5th issue. Will someone give us another on the best way to remove the flywheel without investing in a special flywheel remover?

H.A.C.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Pistons Too Heavy!

Since I had my 1911 V.S. Peugeot twin fitted with new pistons, rebored, etc., vibration is more than it used to be, and at one certain speed very bad indeed. The pistons are much heavier than the old ones, and I have drilled and cut down as much as I dare. The machine has done 3,000 miles since repair. Will it spoil the cylinder if I turn all the skirt off each piston—A.M.

We should not advise you to turn off the base of the piston unless it be a very long one. The bearing surface of the piston should have a minimum length equal to the bore of the cylinder. It would be preferable to fit new and lighter pistons if it is found to be impossible to lighten your present pair further.

A Suitable Gear for Sidecar.

I have been specially interested in two articles in a recent issue of *The Motor Cycle*, and shall be glad if you will kindly advise me on two points. (1.) I have had a good deal of trouble with sparking plugs of the non-cleanable type. Can you recommend an English plug that takes to pieces for cleaning? (2.) *Apropos* of your correspondent "Single Cyl.'s" contribution, what gear is likely to give the best results on a 5 h.p. J.A.P. twin and sidecar for ordinary touring work? I have noticed the phenomenon pointed out by your contributor, *i.e.*, that increased engine power does not—as I am geared at present—give proportionate increase of speed. As I am at present a "child in these matters," I have found your excellent paper a most useful source of information on all subjects connected with motor cycling.—H.P.B.

There are several makes of English plugs with detachable insulators. Try the Forward, Sphinx, or E.I.C. Having driven a 5 h.p. twin J.A.P. and sidecar during the past year, and, after considerable experimenting, we found that a gear slightly below 4½ to 1 was the best all-round gear with a three-speed hub. Of course, it should be lower than this for a single-geared machine, say 5¼ to 1 to ¾ to 1. It depends, of course, on the weight of the sidecar and passengers, the amount of fittings, etc., but the above ratios will be found satisfactory under most circumstances.

Sidecarriers and Taxation.

Are the motor cycles with commercial sidecars exempt from Inland Revenue tax?—T.B.

Sidecarriers should be exempt from the Inland Revenue tax, as the reading of the exemption is: "Any vehicle which is constructed or adapted for use, and is used solely for the conveyance of any goods or burden in the course of trade or husbandry, and whereon the Christian name and surname and place of abode or place of business of the person, or the name or style of principal place of business of the company or firm keeping the same, is visibly painted in letters not less than one inch in length." If, however, you use the bicycle apart from the carrier or for pleasure purposes, it is necessary to pay the tax.

Sidecar Alignment.

Please give me some hints as to fitting a sidecar correctly. I am troubled by the back tyre of the cycle pulling off when turning to the left; this has occurred no less than five times.—C.C.

The sidecar axle should be as nearly as possible in line with the rear wheel spindle; if anything, the sidecar wheel may be 2in. to 3in. in front. It is not advisable for the passenger to sit far behind the sidecar axle; in fact, if possible, the weight should fall slightly in front of this line. At the same time, we should advise you to examine your sidecar connections and see that there is no unexpected play in them, taking particular notice of the stay from saddle-pin to sidecar axle. If there is any tendency on the part of this joint to telescope, it should be prevented at once. Further than this, it is almost impossible to advise you without inspecting the machine. You might check the alignment of your wheels, as this, of course, is an important point, and might be the cause of the trouble. Your sidecar wheel should, of course, be parallel with the motor cycle wheel, or, if anything, point very slightly inwards towards the front wheel.

Water in Carburetter.

I have lately bought a new 2¼ two-stroke, and it has given trouble by firing back through the carburetter; this only happens occasionally. It is also uncertain in starting. I might say that I have had the carburetter down and cleaned it and have found a few spots of water and grit in it.—E.R.S.

The water and grit in your carburetter, especially the former, would be quite sufficient to cause the trouble you mention. If, however, its removal does not cure the back-firing, we should advise you to take off the cylinder and clean the piston rings, which may have become stuck.

A NOVEL HILL-CLIMBING TEST.

A 3½ h.p. Ariel, driven by the Ariel Italian representative, climbing and descending a flight of 97 stone steps in Rome. The machine is a standard touring model Ariel with three-speed countershaft gear. The feat was witnessed by a crowd, and was also duly recorded by the cinematograph.

Three-speed Gears.

(1.) I have been thinking of fitting a three-speed gear of the hub type to my 1913 2½ h.p. Levis, although Butterfields, Ltd., recommend a counter-shaft gear. Shall I obtain satisfaction from an Armstrong Mark VII., and is it to be preferred to a Mark VI.? I may say that I own a three-speed A.J.S. and have owned a two-speed A.J.S., and am doubtful if a hub gear will be as reliable. (2.) I wish to have as high a gear on top as possible. Would 4 to 1 be too high, or not?—P.L.H.

(1) We have had excellent results from the Mark VII. Armstrong gear on two machines, and you should have no trouble with this type on a 2½ h.p. two-stroke. On the other hand, if the makers state that a different gear is more suitable to their particular machine, we should advise you to fall in with their advice. The Mark VII. gear is an infinitely stronger hub than the Mark VI., but is, of course, somewhat heavier. (2.) 4 to 1 would be rather a high gear for the machine in question, unless you are prepared to use the middle ratio to a fairly large extent. You can do more harm to the average motor cycle engine by overgearing it than by almost any ordinary driving.

Compression Ratio.—Lubrication.

(1.) I have a Triumph two-stroke motor cycle, and would like to know if a packing put between the cylinder and the crank case, in order to reduce the compression ratio, would be likely to interfere with the proper opening and closing of the ports. I propose reducing the compression ratio during the winter, as I understand that the engine will run more sweetly, and imagine this would mean greater stability on greasy square sets. I do not mind sacrificing power temporarily, as all my riding in winter time is done within the city limits. (2.) I have been recommended to use a pure mineral oil for my engine. Four fills of the measure provided with the machine are supposed to be mixed with every gallon of petrol (proportion one to twelve). Could I safely use, say, three measures of oil to one gallon of petrol? I do not want to experiment with my engine to find the least quantity it will do with, as I am afraid of worn bearings, etc. I understand that the less oil used, the less carbon deposit will result, and this is rather an important matter with "petroil" lubrication. There would probably also be less chance of the upper piston ring seizing in its groove.—OILE.

(1.) If you place a washer below the cylinder it will quite alter the port openings, as both inlet and exhaust and transfer port will open earlier and close later. A thin washer would not make very much difference, though the machine would produce less power, and would waste considerably more fuel. The only way to reduce compression with a two-stroke is to machine a small amount out of the cylinder head or off the back of the piston, and we do not recommend your attempting to try this. The compression on the engine you mention is not unduly high, and we should advise you to leave it as it is. (2.) The Triumph Co. recommend Prices' Motorine C, and in this connection we would remind you that the selection of lubricant is of first importance to two-strokes, especially those that use the "petroil" system, and it is unwise to go beyond the makers' advice, for you may be sure that they have experimented with all kinds of oil in order to obtain the best all-round results. Do not attempt to cut down the supply unless you are suffering from constant smoking and over-lubrication.

Valve Seatings.

I am in the possession of a 3½ h.p. single-cylinder motor cycle, 1913 pattern, that has the exhaust seating worn in a hollow. The garage people inform me that it is impossible to get it right and that it was caused by excessive grinding in of the valve, and, furthermore, that it would require a new cylinder. Would you be good enough to inform me if this is so, as I am hardly prepared to accept this statement as correct, as it appears quite a simple operation to grind this seating?—X.Y.Z.

There should be no difficulty in facing down the top of the valve seat on your machine (a special tool is sold for the purpose), provided it is not worn so low that too thin a layer of metal is left. It will not be possible to machine the whole of the bottom of the port, but a circle of about ⅛in. bigger radius than the valve head should be possible. You must be losing a very large amount of your valve efficiency if the seating has sunk to any appreciable degree.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"S.F.H." (Birmingham).—4-5 h.p. four-cylinder F.N. Reliability and cost of upkeep.

"T.R.M." (Lancs.)—T.T. 3½ h.p. Norton, Triumph, and A.B.C. Speed and reliability.

"G.H.H." (Manchester).—Velocette two-speed. Reliability, fuel consumption, speed, and chain drive.

"E.P." (Doncaster).—Brampton variable gear for 3½ h.p. Triumph. Wear of belts, reliability, and general efficiency.

"J.G.T." (Dublin).—7 h.p. Indian two-speed, spring frame. Reliability, economy, hill-climbing, speed and consumption with sidecar.

"H.S." (Durham).—Philipson hand controlled pulley with two-speed sidecar combination. Also reliable aluminium solder and maker's name.

"T.A.B." (London).—James two-stroke, Invicta and Royal Ruby two-strokes. Wearing qualities, cost of renewals, silence, wear of chains and belts, consumption, and hill-climbing powers.

Harry Reed (maker of the Dot motor bicycle) in a new rôle. He is seen leading a company of the Athletes' Defence Corps, now in training at Belle Vue Gardens, Manchester.

MOTOR CYCLES FOR SALE.

Bat

1913 8h.p. Bat and Racing Sidecar, with overhead valves, just overhauled, in perfect condition; 38 gns., great bargain.—Julian, Broad St., Reading. 43 years' reputation. [X3722

BAT-J.A.P., late 1913, 7h.p., 2 speeds, coachbuilt sidecar, speedometer, electric hooter, only done 2,000 miles, good as new; genuine bargain, £60.—F.S.S., 67, Pall Mall, Leigh-on-Sea. [9061

EG

EXCHANGES FOR 1915 MODELS.

We are now accepting motor cycles and light cars in part payment for 1915 models. Our contracts embrace all the desirable makes, and in many cases delivery can be made immediately.

Write for our "Exchange Form." It will enable you to furnish us with details at a minimum of trouble to yourself.

1914 MODELS AT REDUCED PRICES.

We have still a number of new motor cycles and light cars of this year's manufacture, which we are quoting at special prices for cash and deferred payment sales. We can also effect a limited number of exchanges for these goods.

"SECOND-HANDS" GUARANTEED.

The following selection is representative of our Second-hand Stock. Every machine is guaranteed perfect. A complete list will be sent upon request, and purchases by deferred payments can be arranged.

XL'ALL Spring Forks, for heavyweight large head light and generator; cheap.—Vyner, 26, Newland Av., Hull. [X3851

WANTED, 1913-14 coachbuilt sidecar, or body, for 1912 Enfield; state price.—Burnup, Fordwood, Ashford, Middlesex. [9026

MAGNETO for 2-cyl. Aster in exchange for magneto with continual current for lighting.—Hoyle, New Waverley Hotel, Hull. [X3658

WANTED, Aluminium Torpedo-shape Sidecar, must be thoroughly up-to-date.—Stancliffe House, Grimethorpe, Barnsley. [9003

ANY Number of Douglas 1913 and 1914 models, also Morgans; spot cash paid.—Maudes, 136, Gt. Portland St., London, W. [9176

WANTED, for cash, motor cycles, combinations, and light cars.—Write, Box L6,469, *The Motor Cycle* Offices, 20, Tudor St., E.C. [9082

WANTED, Douglas, 1912-1913, or exchange 8h.p. overhead valve Matchless. — Bound's Garage, High Rd., Kilburn, London. [9138

WANTED, 2 or 3-speed gear, also lamp set, speedometer, good saddle, and motor cycle accessories, cheap.—125, London Rd., Manchester. [0S60

WANTED, counter-shaft gear, or Philipson, fit 3½ h.p. Premier; exchange 3 ga. gramophone and records to value.—F. Gasson, Harstgreen, Sussex. [9095

WANTED, magnetos, carburetters, tyres, speedometers, lamps, frames, engines, motor cycles, old cars; spot cash.—Grove, 224, Fore St., Edmonton, London. [9160

WANTED, motor cycles, second-hand (Rex-Jap, Douglas, Triumph preferred); state full particulars; rock bottom cash price.—Write, Box L6,500, *The Motor Cycle* Offices, 20, Tudor St., E.C. [0624

LET us sell your motor cycle on commission. We have customers waiting for machines. No sale, no charge. Full responsibility taken.—Longman Bros. and Aitkin, 1, King St., Acton. Tel.: Chiswick 1578. [8801

AUTO-WHEEL and Cash, for 1911 twin Enfield lightweight, just overhauled and renovated, looks new, speedy, powerful, good tyres, new B.B. carburetter, Brooks best saddle, easily manipulated.—Photo, 26, Tapton Bank, Sheffield. [X3849

ADVERTISER, having designed and perfected high tension magnetos, for which working drawings, patterns, etc., are prepared, invites enquiries from engineering firms desirous of taking up their manufacture in return for wholesale agency. Principals only.—Address, Box L6,495, *The Motor Cycle* Offices, 20, Tudor St., E.C. [9024

WANTED, any number of motor cycles, combinations, light cars, sidecars, engines, accessories. We buy, sell on commission, or exchange. We have several clients waiting for good machines. Send us particulars. We have the largest clientele, the finest salerooms, and obtain the highest prices; terms, testimonials, etc., on application.—Morgan and Maxwell, London Motor Salerooms, 80, High Rd., Streatham, London [X9559

EXCHANGE.

3½h.p. Ivy-Precision for furniture or cash. — 137, Holland Rd., Harlesden. [9103

EXCHANGE 5h.p. Rexette Tricar for motor cycle.—Minor, Pinfold Gate, Loughborough. [X3737

PALMER'S Garage, Tooting, will make you a good exchange. Write for complete catalogue.

WILL Give £15 Cash and 7-9h.p. 2-speed Red Indian for Humberette or good cycle car.—Palmer's Garage, Tooting. [9075

MOTOSACOCHE Lightweight, new tyres; £6; exchange good road racer and cash.—Myers, Lees, Keighley. [X3835

EXCHANGE two motor cycles, 2½h.p., and 3¼h.p., for one higher power.—Clow, 47, Cooper St., Leicester. [X3702

EXCHANGE 1914 P. and M. for 1914 2-speed Douglas and £10.—Box 6,940, *The Motor Cycle* Offices, Coventry. [X3787

EXCHANGE 3½h.p. Zenith-Gradua, perfect, for Sizaire, cycle car, or 2-speed lightweight, small cash adjustment either way.—16, Lee Park, Blackheath. [9017

The New "DRUID" SPRING FORK

embodies many features which merit the closest attention of the rider who desires the greatest possible comfort awheel.

We have named it

The "DRUID" MARK II.

and it is designed and constructed so as to completely absorb all vibration and road shock, BOTH IN A VERTICAL AND HORIZONTAL DIRECTION.

¶ Like previous models, the "DRUID Mark II." can be readily fitted to any make of motor cycle and is equally valuable both on Solo or Sidecar machines.

¶¶ If you are purchasing a new machine, specify "DRUID Mark II." Spring Forks, but first ask us to send you fuller particulars.

TONGE Welding Works, 174, Oldham Rd., Middleton, Manchester.—Experts in broken cylinders, crack cases, etc. Welding aluminium a specialist. Nothing too difficult. Sound work at moderate charges. [9189

DO YOU KNOW

that in the early days of motor cycling it was necessary to take one end of its fastener off the belt in order to take the belt off the machine? To our Mr. Stanley Webb is the credit for introducing the hook fastener, which obviated this tiresome business, and set the lead to all detachable fasteners. Thus the

STANLEY FASTENER

was first, as it is still the best.

Another invention, promising equal relief to belt users, is the

STANLEY SPARE LINK.

Below it is shown used to lengthen an otherwise too short belt. It is an improvement on adjustable hooks, as it affords a gripping surface all round the pulley, thus conserving engine power and stopping belt slip. Accurately made with tough leather pads on toughened metal frame. Will last for years. Specially recommended for use with the "Philipson" Pulley.
Costs ONE SHILLING only.

Other Stanley Good Goods:
Stanley Fastener .. .. 9d.
Stanley "Shield" .. .. .. 8d.
Stanley Adjusting Hooks, 6d.

Patriotic Trading.

AFTER looking carefully through *The Motor Cycle* Buyers' Guide, more than one reader has drawn our attention to the considerable number of foreign magnetos adopted as standard on British made motor cycles. This fact is naturally distressing to patriotic Britishers; but that such is the case is not surprising to those closely in touch with the movement, since in this country the magneto has been neglected by our electrical experts, who have left its manufacture mainly to foreigners.

What is the result? We are, as usual, unprepared. It is, however, some consolation to know that several of our best known electrical firms are taking up the manufacture of magnetos with all speed, but such a delicate piece of mechanism cannot be turned out in a moment; special machinery has to be laid down, and workmen trained in this particular branch of electrical engineering have to be employed. All this means delay. British firms cannot deliver, the stock of German magnetos soon becomes exhausted, and the motor cycle manufacturers must go somewhere to get their magneto machines. The obvious outcome of this is that the makers have to look elsewhere than in England for this important part of the motor cycle, so that at the present time the trade is going to the United States. We have no one to blame but ourselves, as due warning was given to the industry by *The Autocar* and *The Motor Cycle* over a year ago—a warning which, we are sorry to say, was disregarded by those whom it concerned.

The British manufacturers who have set to work to turn out magnetos have an uphill task before them, and they have a good deal to learn, as even the most expert of them will find it none too easy to make successful articles at the outset, but doubtless we shall win in the end. Now it behoves us to bestir ourselves, and the sooner our motor cycle manufacturers give all the encouragement they can to the English magneto firms the better. We are told that England has much to gain from this terrible war by capturing Germany's trade, and undoubtedly this is so, but we must be careful that this capture does not take too long a time, since America is very much alive to her chances at the present epoch. It is a case for practical patriotism, and we trust our traders will never forget the remarks of our present King, "Wake up, England!"

The Sidecar and the Army.

THE valuable use of the motor bicycle in the war has naturally had its good effect, and now it is the turn of the sidecar to show its worth. That such a light and mobile vehicle as a motor cycle and sidecar would sooner or later be pressed into the services of the Government was plain to all who are acquainted with its reliability and speed.

We now know that every division of the Army is to have its motor machine gun battery, *i.e.*, sidecars carrying quickfiring guns. These batteries, moreover, are not a section which have been hurriedly decided upon for use in the present war, but we happen to know that the subject is one which has been under consideration for some considerable time, and the motor machine gun battery will become a permanent section of the Army. We sincerely hope, indeed we know, that the sidecar will acquit itself well, and we look forward to its uses being considerably extended in the near future. There are all sorts of conditions under which a light stable vehicle such as a sidecar would be of advantage, and there is no doubt that both the motor bicycle and the motor cycle and sidecar have not yet reached the limit of their practical uses even in the present war.

Coventry, the centre of the motor industry, has provided the *personnel* for the fifth motor machine gun battery, and we are glad to say that this battery includes the names of a number of well-known riders who can be relied upon to give a good account of themselves.

The Design of Drip-feed Lubricators.

A VARIETY of drip-feed lubricators is now on the market, and there is no question but that a properly designed sample in careful hands is an improvement on the old-fashioned pump, with its monotonous periods of "too much, sufficient, and too little" oil. At the same time, some of these devices are very crudely designed, and this year's riding suggests that the following points are essential to a satisfactory design.

(1.) A cut-off tap. Some patterns have a cut-off combined with the adjustment of the drip. There may be two grave defects in this design. On the one hand, whenever a machine is left in a garage or other public spot, the inquisitive loafer whom too many proprietors permit to roam about, is pretty certain to twiddle the dial index, and finally to operate the pump, with the result that the crank case is half-full of oil when the owner returns to take out his machine. This indicates that a secret cut-off is desirable, in the form of some unobtrusive tap concealed beneath the tank or frame tubing. Again, if the drip be shut, and the pump is left full of oil, with the heavy pressure of a strong spring behind it, a leak is bound to be forced somewhere, and such devices are, therefore, apt to cause ugly smears on the tank top. The faintest smear of greasiness on the tank will collect road dust in dry weather. It is, therefore, questionable whether there should be a cut-off in the drip itself.

A cut-off is most especially essential to those systems in which crank case suction pulls the oil through the drip, as opposed to others in which a spring pump pushes the oil through. Such a system may function admirably without any cut-off in ordinary undulating country; but when the machine is taken into hilly country, the engine sucks through lots of oil when coasting down long hills with the valve lifted, and this makes for a dirty engine and sparking plug troubles. We really want a cut-off that:

(*a*) Can be locked with a key, or

(*b*) Is so unobtrusive that loafers will not readily find it.

(*c*) Is not combined with the needle valve of the drip.

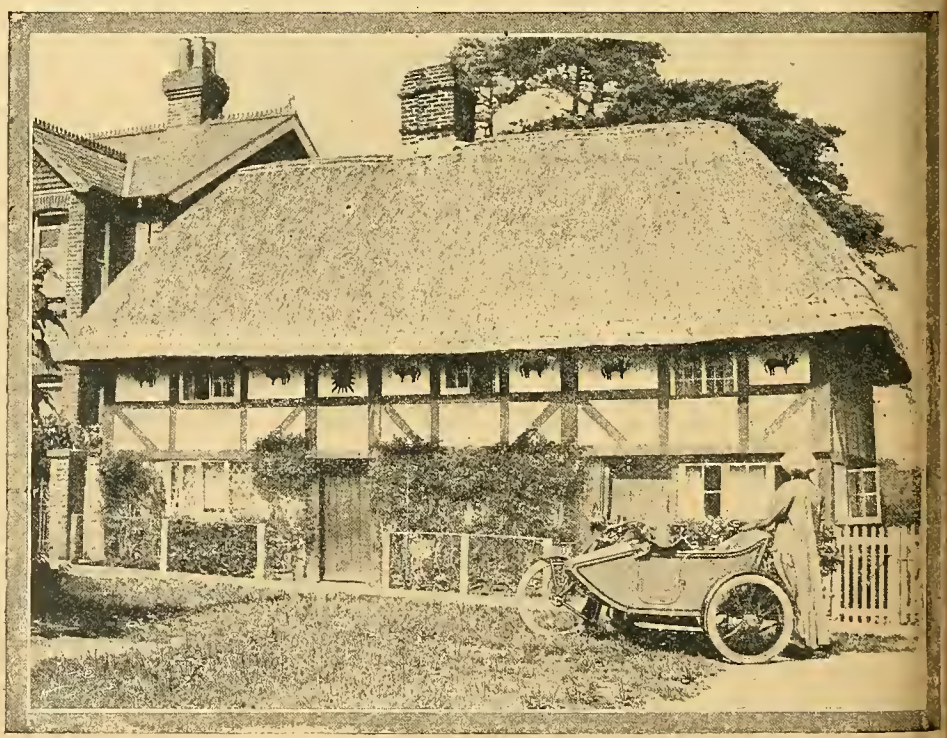
(*d*) Is set so low down on the oiling system that the higher portion of the system can accommodate any oil left in the pump when the machine is put away.

The pump itself should have a bayonet joint lock as well.

(2.) It should be possible to inject a whole pumpful of oil instantaneously in emergencies without disturbing the drip adjustment. Some patterns are intended to meet this want by the unscrewing of the drip-feed valve. There are two objections to such provision. One is that the pumpful is generally wanted in a hurry, and that the maximum orifice of the valve is very small; hence the hasty injection of a complete pumpful is likely to spring a leak at the weakest point of the drip device or its connections. The other is that we cannot always confine ourselves to one and the same oil; and that some precision is required in setting the drip. Not every rider can be trusted to restore the drip setting accurately after he has hurriedly opened it to inject extra oil on a bad hill.

(3.) As the joints of these devices are subject to heavy pressure even in careful use, the unions and joints should be of the most substantial character. As they are mostly bedded in the thin and rather bendable metal of the petrol tank, they need scrupulously good workmanship.

RUNABOUT.



"CAT COTTAGE," HENFIELD, SUSSEX

A former occupant of the cottage, a very eccentric old man, carved the cats which are seen on the walls. Each cat holds a bird in one of its front paws. He then ran a wire round the place, just underneath the thatched eaves, and on this he suspended strings of shells, connecting the whole lot up to another wire inside the cottage. This he pulled at night when his neighbours were in bed, and so annoyed them with the din that they pulled the whole contraption down. He then bored a hole through the end wall and placed an American flag through. The villagers stole it. This second act so exasperated the old man that he enlarged the hole, wrote ZULU HOLE just beneath, and sat through the night with a rifle pointing through the orifice ready to shoot anybody who got too close to his cottage.

Occasional Comments

"By Ixion"

A Hint to the Trade.

The other day I met a well-known competition der, whom increasing years and family responsibili- s are now limiting to the touring sphere of motor cling. "Well?" I asked, "What's your machine r next year? Another ——?" "Not much!" torted he; "I'm getting middle-aged, and I've mpled a baby two-stroke. I've done with tump- mp-tump, and I shall stick to b-r-r-r-r-r!" I don't y that his opinion is necessarily an index to public inion, but I've heard a good many sportsmen who e nearing the thirties talk in the same strain, and can quite believe that men whose skins and nerves d arteries are growing more sensitive will value the en, vibrationless two-stroke sensation more and ore highly with advancing years. If such a man is scontented with the comparatively tame paces of e 250 c.c. babies, there is no big two-stroke on the arket but the Scott. This looks as if 1916 and 1917 ght see many of the 500 c.c. firms launching out th 500 c.c. two-strokes. What say you, my masters? the way, I hear the big order for the new motor cle machine gun unit will keep the Scott works zling night and day for several months to come.

Rear Chain Cases.

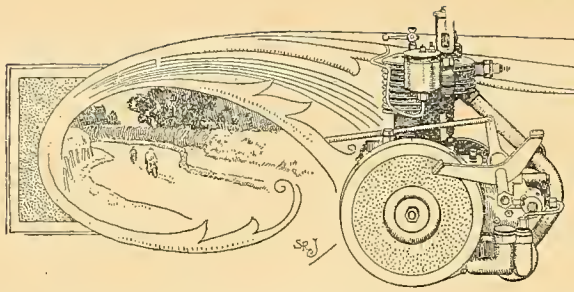
I see with some sympathy that the 1915 Indian still chews a rear chain case, for, if I may be frank, no tail of the modern machine has caused more uble and annoyance during 1914. The ideal is ty, and few there be that reach it. The chain case ust be absolutely rattleproof in all its details, and, ough its depth be shallow, there must be sufficient dding to prevent the securing studs and bolts from ring out, despite the frightful vibration which con- ntrates along the chain stays when the average V in is raced on a low gear, or run with the road wheels tionary. A panel should be provided to facilitate hing one end of a disjointed or broken chain out the dark and oily cavern. The cases must fit with solute dustproofness around the rear spindle. Pre- ably, the rear arc must be hinged and drop down t admit of rear wheel removals. The edges of these mplicated joints must be readily refitted without the e of sledge hammers, cold chisels, or profanity. No nder some makers become pessimistic, and prefer e common or garden naked rear chain, with or with- t a little rain cover. If the rear chain case is tained, I am all in favour of the horizontally split riety. With the vertically split type, rattles are ways lurking round the corner, the end of a loose ain requires much fishing for, and the back spindle nt is not lightly to be tackled with cold fingers in e dark. Moreover, when adjusting a chain thus cased, it is quite difficult to test its tension at any int except on the sprocket teeth. *Per contra*, the ar wheel cannot always be removed as swiftly as one nts in a split-second trial, if the horizontally split se is adopted.

Hurrah!

Whenever some earnest correspondent revives the old belt *v.* chain controversy, we receive appallingly contradictory evidence on the life of chains and their tendency to break. The cognoscenti grin, knowing that the man who gets a brief chain mileage and many fractures is simply giving himself away, and confessing—if not in so many words—that he runs his sprockets out of alignment and forgets to adjust his chains "by the tight place." At last a motor cycle firm have really and actually adopted a device which should prevent the wildest novice from setting his rear wheel out of alignment when he uses his draw-bolts. But by one of fate's cynical ironies the firm concerned is one that still adheres (wisely, in my prejudices) to the belt-cum-chain drive. Study the little notched plates on the back spindle of the new Rover on page 565 in our issue of November 19th last. If a similar safeguard were incorporated in all chain drivers, and if the toolbags of new machines contained a card describing the basic principle of chain adjustment, we should have precious little of chain troubles during next season. But when duffers are encouraged to set their back wheels out of truth, and are left to test chain adjustments at the saggiest spot in the chain run, what *can* we expect.

A Carburetter Suggestion.

I have often been puzzled by the extraordinary petrol economy attained by some of our very "clever" boys, and have long suspected that some secret existed which was beyond my ken; for, no matter how carefully I have executed the stereotyped wrinkles, I have never attained the miles per gallon which the cracks record in important tests. A correspondent sends me a suggestion which I publish for what it is worth—I have not had time to try it. He considers (as the result of his own experiments) that the *real wastage of fuel occurs at small throttle openings*, and that all tuning for economy should aim principally at reducing the amount of spirit used in slow running. Under these conditions the suction on the jet is extremely fierce. Attempts to reduce this suction by opening the extra air inlet fail because they over-weaken the suction. He is of opinion that the shape of the throttle valve is the crucial point, especially with the straight-through automatic type of carburetter. For example, a throttle piston might be 1½in. in diameter, in which case the engine suction would be wiredrawn through a long, narrow orifice, when the throttle was nearly shut. If, *per contra*, the throttle piston is but ½in. in diameter, and that side of it which faces the jet is chamfered upwards, the suction on the jet is reduced, though it is still fierce enough to draw out a sufficiently rich mixture. Whether there is anything in the notion, I cannot say without a test; but it certainly looks like it, for I confess that his average consumption is a long way better than my own ever is, with the standard throttle valve.



Detachable and Interchangeable Wheels.

ANCIENT AND MODERN.

FIRST INSTALMENT

By ERIC W. WALFORD.

THE English language requires the invention of a new adjective to describe the type of wheel which is meant by the above title. The usual term "detachable" as applied to wheels does not convey to the lay mind what is intended. All wheels are detachable, but they are not all detachable in the sense here meant. Motor car wheels are always detachable and always have been, but the so-called "detachable" wheel is a comparatively recent introduction. Such wheels are easily detachable without disturbing the bearings and driving mechanism. An additional point is that the detachable part can be fitted on any of the axles on the car.

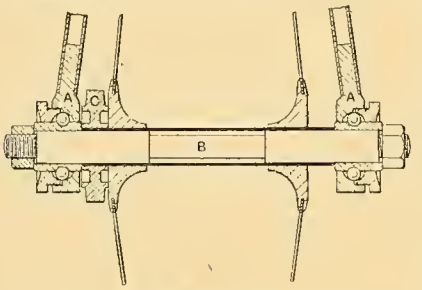


Fig. 1.—The construction outlined above, dated 1888, probably constitutes the first "detachable" wheel.

A motor cycle detachable wheel differs in that its bearings are removed with the wheel. The point that the wheel when removed can be fitted to the front or rear forks or to the sidecar is not the chief one, although it is, of course, becoming of very great importance. The chief advantage, to my mind, is that this ease of detachability facilitates tyre fitting and repair. The detachable and interchangeable motor cycle wheel will probably become universal, as it is on cars. Its good points have been proved, and the constructions adopted by certain motor cycle manufacturers have shown themselves to be quite satisfactory.

In view of the increasing adoption of this idea it is probable that a review of existing and proposed constructions for use on motor bicycles will be of interest, but, as the broad idea is by no means new, treatment of this subject cannot be complete without reference to constructions of a similar nature which have been proposed for pedal cycles. Many a supposedly new idea in the motor cycle world has been found to have been anticipated by "push" cycle inventors. In the early days of pedal cycling tyre troubles were so frequent that it is not astonishing that very many inventors gave their attention to schemes for enabling the tyre, and if necessary the wheel, to be removed without disturbing the chain. Some of these inventors even went so far as to suggest that the rear wheel might be interchangeable with the front.

Early Constructions.

Probably the first construction to be patented was that invented by Mr. J. G. Jelley, who is known to many motor cyclists as the inventor of the Three Spires and Double Clinch tyres, a new motor cycle saddle, etc. The arrangement, which is shown in fig. 1, differs in one important respect from modern constructions in that the bearings remained in place when the wheel was detached. The outer races A of the bearings were brazed into the fork ends. The spindle B revolved, but could be withdrawn either way, leaving the hub and chain sprocket C unsupported and removable. The chain could then be lifted off the sprocket, allowing another chain wheel to be fitted in order to alter the gear ratio.

Another early construction is shown in fig. 2, which is based upon the drawing appearing in a patent specification of the year 1897. The drawing is diagrammatic, and is reproduced in place of the patent drawing, as the latter shows a hydraulic driving system, which is of no interest. In this case each fork end supports a short spindle length A, one of which carries the driving member, which I have shown as a belt pulley. The other may,

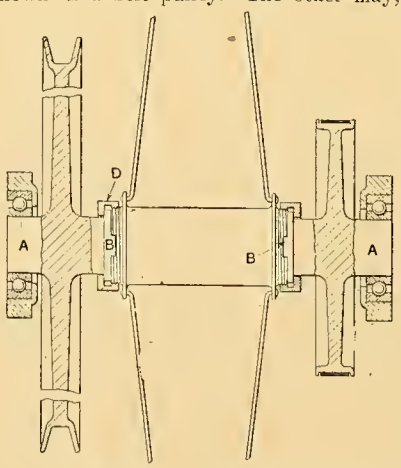

Fig. 2.—An interesting construction which possessed no spindle (produced in 1897).

obviously, carry a brake drum. Each these short spindles is provided wit flange B, and this flange carries a metrical key C, as the perspective v shows. In fact, this flange and resemble closely one member of an ham coupling. Each end of the hub is provided with a diametrical slot, the hub is slipped into place between two spindles, so that the keys C slide the slots and provide a driving connec between the spindles and the hub. spindle carries a screwed ring D, res bling closely the nut of a pipe un This screws on the hub shell so that spindles and the hub become practic

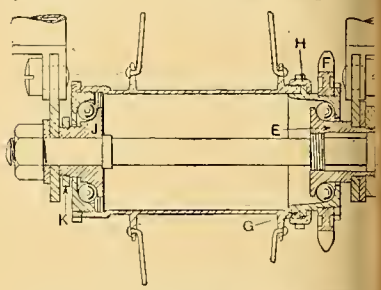

Fig. 3.—An early type with a complete spindle.

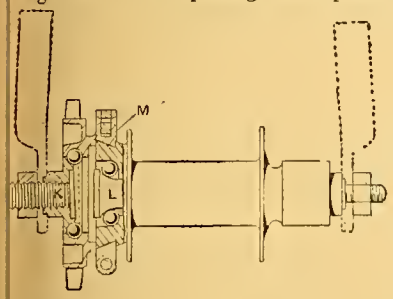
united. To remove the wheel the nuts D are slacked off and the wh pulled away, leaving the two spindles supported by their bearings. In this c it will be understood that there is spindle passing right through the shell, and that support is required fr the nuts D. Also the bearings are removed.

Device Incorporating a Complete Spin

The arrangement shown in fig. embodies the use of a spindle extend from one end of the hub to the oth This spindle unscrews and withdraws the right, leaving a short sleeve E, s ported by one rear fork end. This sle is formed with a cone on which is a b race carrying the pedalling chain sproc F. The chain sprocket is clutched by clutch teeth to the hub shell, and th is a kind of union nut H which clam the shell and the centre of the ch sprocket together. The left hand of hub shell runs on a cone J on the spind When the spindle is drawn out to right this cone is unsupported, so a K is provided, which can be screwed to the right when the wheel is to detached. To do this the nut K screwed up as described, the spindle screwed and withdrawn to the right, a the nut H unscrewed, allowing the hub be moved to the left slightly to disenga the driving teeth at G, which allows the h

tachable and Interchangeable Wheels.—

come away. When the hub is removed it ll be seen that the right-hand ball bear- g would be insufficiently supported, but ere seems to be no chance of the balls lling out. In replacing the spindle there would probably be some difficulty in threading it through the left-hand cone J. The hub shell is supported by both rows of ball bearings when the hub is in place, so that a substantial attachment of the hub shell to the chain sprocket is essential. This, therefore, does not seem a very attractive system.



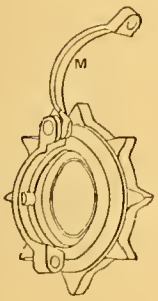


Fig. 4.—The vided spindle ea as evolved in 98.

Adoption of the Divided Spindle.

In fig. 4 appears for the first time (1898) the divided spindle idea, which is used in some of the modern constructions. Here the chain sprocket is carried by a self-contained ball bearing on a short spindle length K. The hub shell is mounted upon two bearings, one at each end of the major spindle part L, and the chain sprocket carries a split clamp M, which grips a coned part of the hub shell. To detach the wheel the split clamp is disconnected, the right-hand spindle nut slacked, and the hub shell drawn away. Here the rigidity depends upon the tightness of the clamp M, but there are only two parts to be unscrewed, the clamping screw and the spindle nut. There is, obviously, no mutual support between the two spindle parts.

The divided spindle idea is also shown in fig. 5, which, with the constructions shown in figs. 3 and 4, was patented in 1898. The chain sprocket runs upon a pair of ball bearings on the short spindle part N, and the hub shell ball races are formed on a bearing sleeve O, fitted on the major spindle part P. The driving connection is formed by diametrical key and slot at R, like that shown in fig. 2.

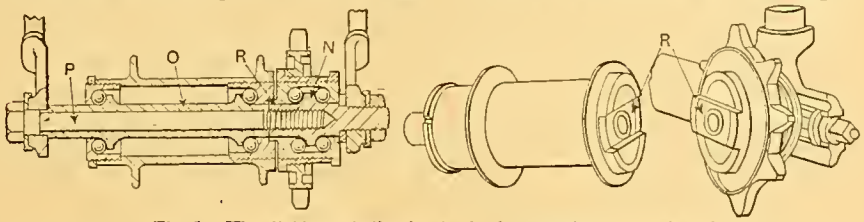

Fig. 5.—The divided spindle plan in the form used on motor bicycles.

To detach the wheel the main spindle part P is unscrewed and withdrawn to the left, and as the driving connection R is a diametrical one, the wheel can be moved radially out of position. This design shows the bearing sleeve O, which is commonly used in modern constructions, and which it closely resembles.

(To be concluded.)

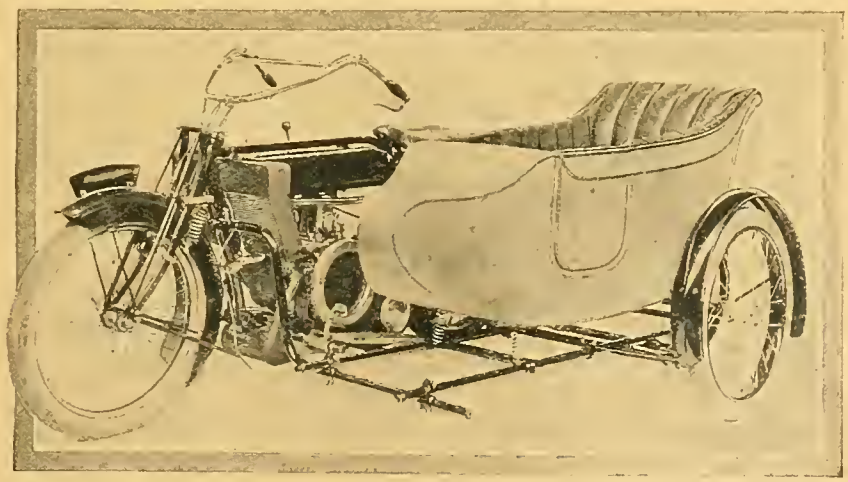
The C.A.V. Dynamo Lighting Set.

An Installation that may be Fitted to Solo Machines.

ONE of the earliest firms to study the problem of electric lighting on motor cycles was that of Messrs. C. A. Vandervell and Co., Warple ay, Acton Vale, W. The firm, which s always played a prominent part in e electrical equipment of motor vehicles, me into existence about eleven years o, and occupied itself in the manu- ture of accumulators for cars and motor cles. Soon afterwards Mr. D. Elyard own, one of its principals, began experi- nting with an electric lighting outfit his Ormonde motor bicycle. During e past few years, Messrs. Vandervell ve devoted themselves more especially the manufacture of dynamo lighting tallations for cars, but two years ago, en we suggested to them the desir- lity of adopting this principle to motor cles, they told us that they thought re was no reason why such should eventually be done. Hence, it is with tification that we are able to announce t they have brought out a most cellent outfit, which has passed its perimental stage, though at the present ment its manufacturers are not in a sition to give delivery. At the end of few months, however, when the essary jigs, etc., have been installed, e installation will be placed on the rket.

The set consists of a C.A.V. dynamo ached to the saddle tube of the motor cycle frame. It is of quite small dimen- ns, and, unlike the usual C.A.V. namo, has no free wheel device. The particular outfit which we inspected is fitted to a B.S.A. sidecar combination, the dynamo being driven off an auxiliary sprocket on the counter-shaft. The accumulator is carried in a pannier box about eight inches square and about two and three-quarter inches deep, which is attached to the luggage carrier, thus the set is absolutely self-contained on the motor cycle, so that if the latter is used solo, the equipment is in no way disturbed. Fitted to the accumulator box is a junction box, while on the top tube is an exceedingly neat little switchboard controlling the head lamp, side lamp, tail lamp, and dynamo.

At the present time we are unable to give further details, but we may say that the outfit shows great promise, and will be an inexpensive but truly worthy produce of the firm responsible for its introduction.



Threequarter view of the new 6 h.p. twin-cylinder Humber sidecar outfit, which has three speeds.

(Described and illustrated in issue of November 12th, pages 529-530.)

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Gear Slipping.

Q. My mount is a 1914 3½ h.p. Rudge, fitted with N.S.U. two-speed gear and free engine. The only trouble that I have experienced has been with the gear (engine trouble being nil), and lies in the fact that the bottom gear never grips properly, slipping slightly, though the handle is held firmly in position.—J.R.A.

The trouble you speak of is undoubtedly due to the clutch washer being worn. If after fitting the new washer the trouble still occurs we should recommend you to send the gear up to the company.

A Question of Weight.

Q. I have a four-point suspension coachbuilt sidecar which weighs about 100 lb. Is this too heavy for a 3½ h.p.? I do not want to go fast, but will the cycle frame stand this weight? I have a three-speed hub, and it is a great deal of trouble to take the wheel out every time I get a puncture, so I should like your opinion on butt-ended tubes. Are they reliable? If you think so, I will get two spare ones.—F.M.

We do not think the sidecar in question is too heavy for work in ordinary districts. The weight, however, might be excessive in hilly country. A good butt-ended tube, made by one of the best-known tyre firms, should be quite satisfactory and of great assistance to you.

A Noisy Engine.

Q. Some time ago I purchased a 1910 3½ motor cycle. Whilst out on a run I broke the connecting rod just below the small end. I had a new rod from the makers and had it fitted, but now the engine shows the following symptoms: When travelling with fully advanced spark a peculiar clatter proceeds from the engine—like a succession of small "knocks." This is quite distinct from the clatter of the tappets. The same sound is heard when going down a hill. On retarding the spark the sound disappears. Do you think the bushes on big or small ends are worn? I have not had engine down since repair, as I thought you might be able to locate the trouble for me.—H.B.S.

Without actually hearing the noise it is difficult to diagnose the trouble accurately, but it is probably due to the fact that the big end bushes are badly worn. We should advise you to have the engine down and examine the bearings.

A Question of Gearing.

Q. Can the Douglas 2¾ h.p. two-speed climb Kirkstone Pass? What highest average speed can be expected over give-and-take roads? Does the engine overheat if driven long on low gear uphill?—W.B.

The machine in question is quite capable of climbing the pass referred to, provided the gear is low enough and the engine in good condition. If the gear is too high, obtain an adjustable pulley. You should average between 30 and 35 m.p.h. on the best roads. The engine is not at all given to overheating.

Fixed v. Variable Ignition.

Q. I am greatly puzzled about magnetos with variable and fixed ignitions, and if you could explain the difference I should be greatly obliged. Would not a unit fitted with fixed ignition be more suitable for a novice, as I imagine it would be difficult to determine how far to advance the lever of the magneto, say, when getting up speed from ten to forty miles per hour? If a fixed ignition is reliable for any speed, why be bothered with a variable ignition, as they surely cannot both reach the same degree of efficiency? Finally, will you explain any advantage one may have over the other?—IGNITION.

We should strongly recommend you to read the chapter on Magneto Ignition in "Motor Cycles and How to Manage Them" (obtainable from these offices, price 1s. 2d. post free). To put it briefly, the difference between the two forms of magneto is this. The magneto used with variable ignition has a movable contact breaker, which allows the spark to be advanced or retarde The fixed magneto has a rigid cont breaker with the firing point set so to give the maximum efficiency, a this, of course, cannot be advanced retarded, and consequently a cert amount of flexibility is lost, and y cannot get quite the same results driving. The matter is merely one changing the contact breakers. Althou variable ignition sounds to be somewh of a complication it is really not so, a often a change of gear may be saved slightly retarding the spark when engine is labouring on a hill. Und nearly all conditions, except when sta ing, or sometimes on hills, the spark m be fully advanced. We do not at agree with a fixed ignition on any ki of motor vehicle. It is not a questi of fixed ignition being reliable, but t fact that variable ignition allows you get more out of the engine and great adds to the pleasure of driving.

NEXT THURSDAY!

THE MOTOR CYCLE

EQUIPMENT NUMBER.

Accessories of all kinds, as well as Tyres and Clothing of interest to motor cyclists, will be described and illustrated.

Stuck Piston Rings.

Q. A 1914 3½ h.p. machine whi I have persistently "glues" its rings every 300 to 500 mi so tightly into the piston th only about three hours' labo with paraffin and a knife will disiod them, and often these efforts end disaster to the rings. When this about to happen in running one hea an awful row from the cylinder's inn regions. A long day's work with t sidecar usually starts the complaint. have written to the makers who cann suggest anything. They have sent t two rings, and again two spiral on with fibre washer for lowering compre sion, but the latter has not made a preciable difference. When the machi was new it invariably ran rather hot. notice that although I use plenty of of all brands I cannot make it smo much, neither is there much carbon piston top or cylinder. The piston usually blackened down the valve sic and compression is very nearly nil. timing is correct, and cylinder n scored. As I have only done 5,0 miles or so, I do not want to have t cylinder rebored yet.—G.L.

Are you quite confident in the brand a quality of oil you are using? Use t very best lubricant only. You might t the effect of a mixture of Oild with your oil. This can be obtained fr any accessory dealer, and may he matters. There is no reason why t cylinder should be rebored, unless t cylinder, piston, and rings are ve badly worn.

An Unsatisfactory Beam of Light.

? Please tell me why my lamp gives such a poor light. There is a good mirror reflector at the back, but the front is only common glass. My trouble is that the light is not projected more than two or three yards in front of the machine.—W.S.

he trouble is most undoubtedly due to e burner being wrongly focussed. obably, if you look at the bottom of ur lamp you will find that the burner fixed in a slot and secured by a nut. you undo this nut, light the lamp and de the burner along gently until the st beam ahead is given, and then lock in position, you will then get the best sults from the lamp.

Details of Belt Drive.

? I intend fitting a belt drive from a 6-8 h.p. V twin engine as follows: Pulley 6in., rim 20in., belt 1⅛in., centres 24in., arc of contact on pulley 140°. Please let me know (*a*) if 24in. centres vill be too short for a reliable drive, (*b*) what is the shortest distance prac- icable, and (*c*) is 165° the smallest ractiacable angle as for flat belt drive? —K.O.M.

e length of the drive is rather on the rt side, but it should be possible to ain a fairly reliable drive provided t your pulley is not geared down to a great extent. The same applies to r arc of contact. A 160° arc is irable, but on many machines at sent on the market it is nothing like much as this. If you are using a ee-speed counter-shaft gear we fear t on the low gear you will be apt get a certain amount of slip, as the speed will be very low and will l have to transmit the maximum wer.

Starting on a Clutch.

? I have ridden a 300 c.c. single-cylinder, single gear, belt and hub clutch machine for a season and intend to have a sidecar outfit next year, and I would like to now how to avoid the faults I find in y present mount. My 2½ h.p. is by a rst-rate firm with a reputation on road d track. It was not by any means twenty-five guinea ultra-lightweight, d is still in new condition, but it will ot start on the clutch except on the vel. The engine roars off at the second ick (using pedal like a kick starter), ut no matter what care I take in let- ng in the clutch if there is the ightest gradient the engine stops in ree yards, yet if I come round a rner in a strange town at 5 to 10 .p.h. and find a single figure gradient efore me I open both throttle and air d sail up with neither falter nor nock. Please give me advice in the rchase of a sidecar. Economy both first cost and running expenses is portant, but not necessarily economy petrol. Makers talk as if a big ileage per gallon was important, yet the year's end petrol is one of the nall items in the bill. Speed is not anted at all. I like to see the country I go, though my 2½ h.p. is good for m.p.h. Sure climbing is important, matter how slow.—W.J.

here is any movement at all on the hine it is quite a different proposition from taking up the load from a stand till, as the tractive effort to be overcome even when the machine is just crawling is comparatively slight. Of course, the trouble is one which is likely to be found in all small machines fitted with a clutch and no two-speed gear. If the gear ratio were low enough to enable you to start from standstill on an upgrade it would be too low for ordinary work. What you had better make for is preferably a machine of 5-6 h.p. by the best makers. If, however, you cannot afford a 5-6 h.p. get a 3½-4 h.p. with at least three speeds and a fairly light but comfortable sidecar.

A Troublesome Clutch.

? The clutch of my Riley tricar has never engaged very sweetly, and dressings of castor oil have made it no better, and on one occasion caused slipping. Lately I think some engine oil must have worked into the clutch, as a new trouble has occurred, namely, difficulty in getting the clutch out. I have tried fairly copious applications of engine oil, and this improves things for a short time and, strangely, does not cause slipping as the castor oil did, but the sticking returns very quickly. The clutch is a cone one, leather lined, and as far as I can tell is in good condition and amply large enough—about 10in. diameter over cone. Can you say what will give sweet engagement and freedom from sticking in the cone?—V.P.

You should see that the leather on the clutch is in good condition, and try dressing it with collan instead of castor oil, which is rather better for this purpose. Also see that the spring is not too strong. It looks to us rather as if the clutch leather has been burnt. The sticking may be due to the clutch being over-dressed, or the bearing on which it slides may be full of grit. These points should, therefore, be examined. If the leather is worn or burnt, a new lining is not a big item.

Slow Running.

? I have recently purchased a 1913 2¾ h.p. single-cylinder. The machine runs very well on the open road. I am not, however, able, when in slow traffic, to keep it running on high gear, even when slipping the clutch, and usually have to stop the machine altogether and wheel it. I use it to go to business, and have a good deal of slow heavy traffic to contend with. I have bound up the joints of the inlet pipe with tape to avoid any leakage there. Under ordinary use, what consumption of petrol and oil should there be for this machine? Is boiled oil and red lead suitable for the screwed joints, or what should I use?—ALPHA.

It is unfortunate that several efficient motor cycle carburetters will not allow the engine to run slowly, but it is so. If you use an automatic carburetter you will lose slightly in efficiency, but the slow running will be greatly improved. A 1915 pattern carburetter with pilot jet device would effect an improvement. Also, a well-adjusted by-pass fitted to your present carburetter would be a considerable help. The machine should do about 100 miles to the gallon of petrol, and use oil at the rate of about half a pumpful every six miles. The best preparation for the joints is Rotary paste.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c o The Editor.

"A.D.P." (Cambridge).—2½ h.p. two-stroke, two-speed Clyno and 2¾ h.p. Levis. Power and reliability for touring.

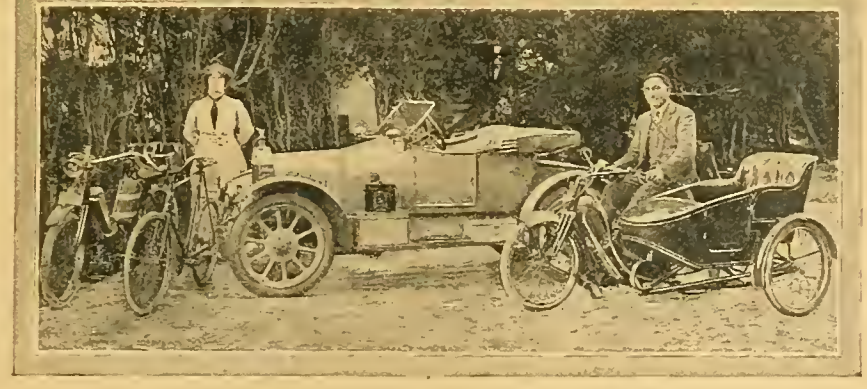
"J.P." (Somerset). — Grado multi pulley. Suitability for use with light-weight in hilly country.

"G.C.H." (Dublin). — Scott. Hill-climbing, consumption with petrol and petrol and paraffin, and general reliability.

"A.C.L." (Yorks).—Saxon light car. Reliability, accessibility, hill-climbing, speed, consumption, and whether magneto can be fitted.

"H.W.H." (Penketh).—Zenith disc clutch hub. Durability and efficiency.

"NOVICE" (Longford).—Big 4 h.p. Norton, 5-6 h.p. Coventry Excelsior, and 5-6 h.p. Rudge for general sidecar work. Power on top gear, accessibility, durability, and consumption, also comparison with twins of similar power.



THE STABLE OF OUR CAPE PENINSULA CORRESPONDENT, ARNOLD KEYZER

The photograph shows the first Scott motor bicycle imported to South Africa, a 1914 Singer light car, and a 1914 Scott motor bicycle and sidecar, the body of which was built to Mr Keyzer's design, with collapsible seat and suitable for carrying luggage.

1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

1915 NORTON MODELS.

IT is interesting to note that the 1915 Norton programme includes a countershaft chain driven model, which is not an entirely new one, but an old one resuscitated—with, of course, various improvements incorporated. It will be fitted with the Norton "Big Four" engine, which has been still further improved for the coming year. There are three speeds, and the transmission includes a cushioning device to absorb shock without loss of power.

The latest 3½ h.p. T.T. and 3½ h.p. Brooklands Special models will be built on somewhat smaller lines than previously; the former has a dropped top tube. The Brooklands Special will be supplied with a certificate to the effect that it has attained over 70 m.p.h. on the track.

A 90 m.p.h. Norton.

We have lately inspected a Norton "sprint" machine, from which great deeds are expected. Mr. J. L. Norton, who showed us the machine, was confident in his belief that it will attain a speed of ninety miles an hour over a short distance, and mentioned, incidentally, that the firm were anxious to perform such a feat in the near future, and thus gain for the Norton the credit of being the first 500 c.c. machine to attain such a high rate of speed. The bore and stroke are of 79 × 100 mm., and outwardly there is no change in the appearance of the engine from the standard Norton of these dimensions. Should Mr. Norton's anticipations be fulfilled, a bigger tank will be substituted for the torpedo tank fitted, and D. R. O'Donovan, who is to ride the machine, will then attempt long distance records. The usual gear on the Norton for track work is 3¹⁄₁₆ to 1, which, it is interesting to note, with 26in. wheels, will necessitate a speed of over 4,250 r.p.m., ignoring belt and wheel slip.

Each of the new touring models will be provided, as an integral part of the machine, with means for sidecar attachment.

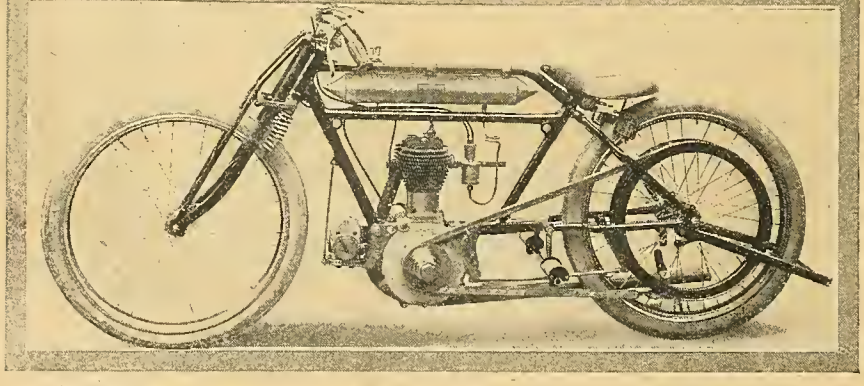
As showing the attention to detail given by the makers of the Norton machines, the filling cap for the tank on the dropped tube models is a good example. The filler cap, whilst screwed down to give a sealed joint, is hinged to prevent loss. Further, both caps are fitted on to a cone, which brings them well above the level of the tank, so facilitating filling and the avoidance of splashing.

The 1915 Nortons may be obtained with a straight or "dropped" top tube, and the makers incidentally point out that for those who desire large petrol and oil capacity the straight top tube is recommended. This is a point not generally appreciated.

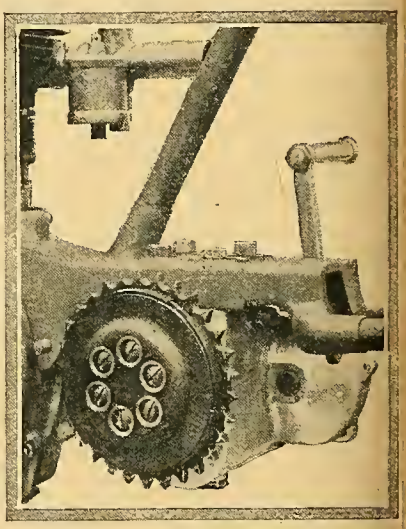
EDITORIAL NOTE.

ALREADY many full descriptions of 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions appeared:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Abingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	22nd.	J.A.P. engines, Calthorpe, Lucas dynamo.
,,	29th.	Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2½ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun Vitesse, and Levis.
,,	19th.	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p. Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.
,,	26th.	Rudge, O.K. Junior, Wooler, New Imperial, J.H., Lady's Radco, Wulfruna, Bradbury, and Hazlewood.



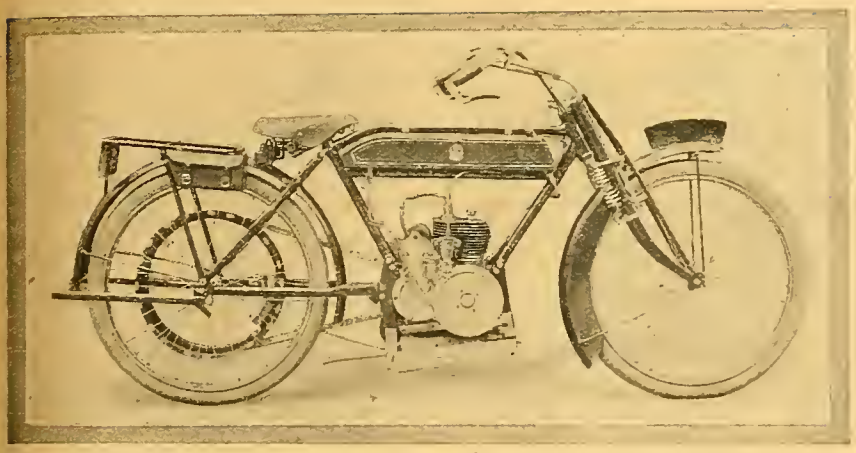
The T.T. "Sprint" Norton on which it is expected to attain a speed of ninety miles an hour.



Showing the method of fixing the Sturmey-Archer countershaft three-speed gear to the bottom bracket of the Norton.

2¼ h.p. GRANDEX-PUP.

AN exceedingly handy little lightweight is the 1915 Grandex-Pup, which we recently had an opportunity of inspecting at the Grandex Co.'s showrooms at 86, Gray's Inn Road, W.C. The machine is fitted with the new 2¼ h.p. Precision engine, the valves of which are mechanically operated and vertical instead of horizontal as formerly, while it may be remembered that the dog clutch two-speed gear is incorporated in the crank case, the change being operated by means of a pedal. The machine we saw was not the final model, and the next batch will be altered in various details; for example, instead of a U.H. magneto the Splitdorf will be fitted. The machine will be provided with aluminium footboards, and an improved heel-operated brake with transverse pedal will form part of the equipment. The sileneer is large, and fitted with a long exit pipe so that the little machine should be fairly silent. Either Druid or Saxon Spring forks may be had to order.



The Grandex "Pup," which is fitted with a 2 h.p. Precision engine with side by side valves.

The frame possesses a dropped top tube, while an excellent piece of work is the bottom bracket, which is in one piece and brazed directly on to the chain stays. A Bowden handle-bar is fitted complete with levers and wires, the latter running inside the bar and presenting a very neat appearance. The carburetter is the well-known B. and B. The machine, which is sold at quite a moderate figure, is well equipped and turned out with 2in. tyres, luggage carrier, and metal cased tool-bag.

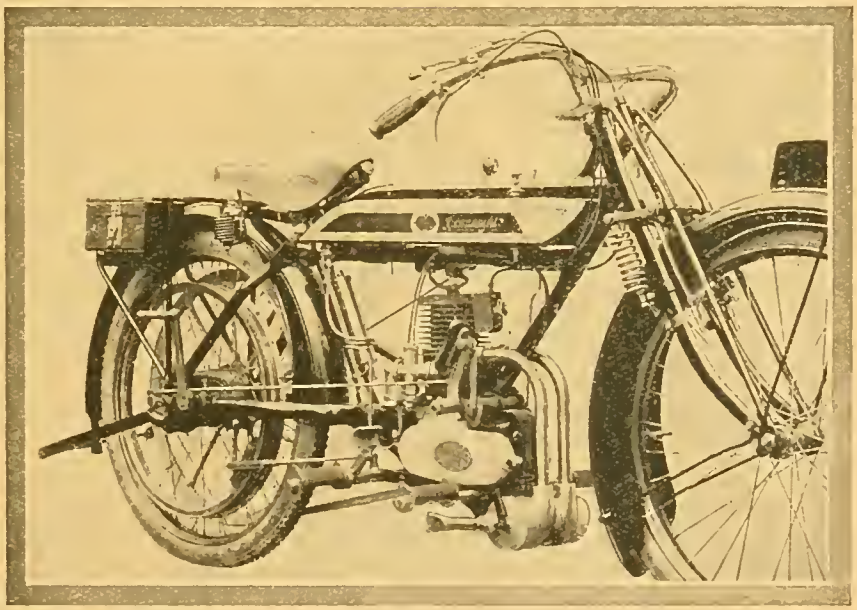
THE CONNAUGHT TWO-STROKE.

THE 1915 Connaught is very little changed in outward appearance, but many little improvements and refinements have been incorporated in the latest model. The front fork shackles and fixings have been much strengthened, and as regards the mud-guards a reinforced strip is used which renders them much stronger than formerly.

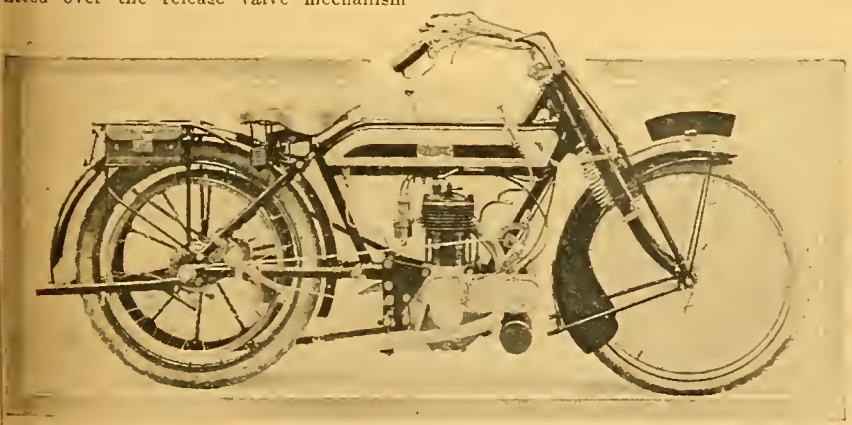
The engine is practically the same as in 1914, viz., bore and stroke 75 × 70 mm. respectively. The piston has three rings, but the crankshaft is now mounted on Hoffmann ball bearings, and a shield is fitted over the release valve mechanism to prevent oil being splashed over the rider's overalls.

Though the Connaught is extremely low, and has a double top tube (of which not all lightweights boast), the tank capacity has not been unduly restricted.

The Connaught is obtainable either with a two-speed counter-shaft gear or a three-speed hub gear, whilst the single-geared model is sold at the modest figure of £33 10s.



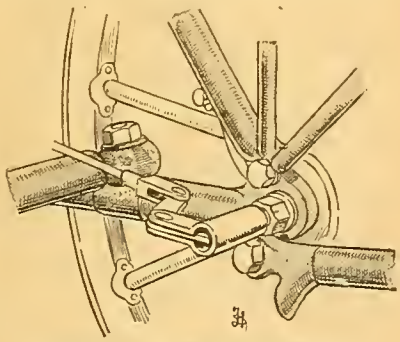
The latest two-stroke Connaught, showing double exhaust pipe and covered-in release valve.



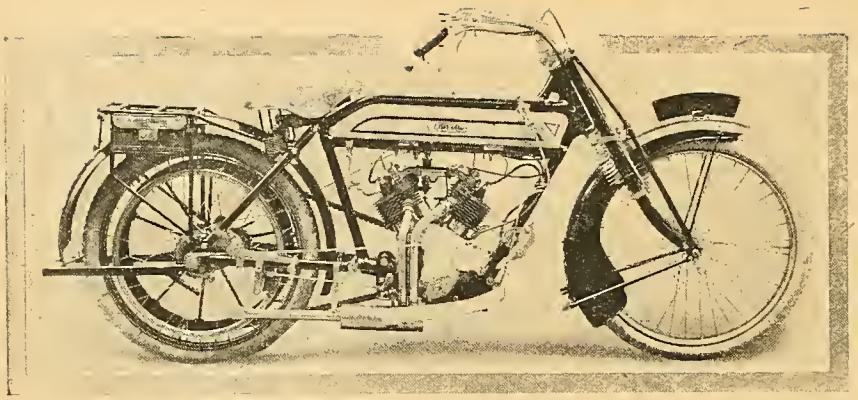
The 3½ h.p. Brown has been entirely re-designed, and one of the latest specimens for 1915 is shown above.

1915 BROWN MOTOR CYCLES.

IN our issue of October 15th (page 437) we dealt with the Vindec two-stroke and the interesting and beautifully-made little engine fitted to the 3½-4 h.p. twin-cylinder Vindec, sold by Messrs. Brown Bros., Ltd., Great Eastern Street, E.C. We have now been enabled to see one of these machines in its final form, and it must be admitted that it is an exceedingly handsome little mount. The gear supplied is the Armstrong three-speed, which in future models will be supplanted by the Sturmey-Archer. The twin-cylinder Vindec and the single-



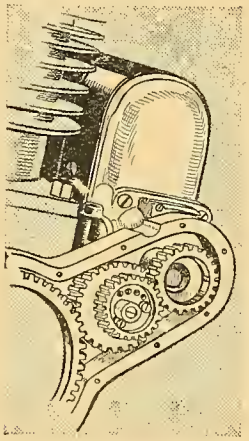
Pivoted sidecar fixing on Ixion machine.



The new 3½-4 h.p. twin-cylinder Vindec.

cylinder 3½ h.p. Brown have certain things in common; for example, the neat aluminium footboards, the excellent mudguarding, the glass-topped petrol filler cap, the substantial back stands, front stands, and luggage carriers. In both cases, also, adjustable pulleys and Best and Lloyd lubricators are supplied.

The 3½ h.p. single-cylinder model, 85 mm. × 85 mm., is an old favourite,



Timing gear on the 3½-4 h.p. Vindec. Observe the eccentric magneto drive

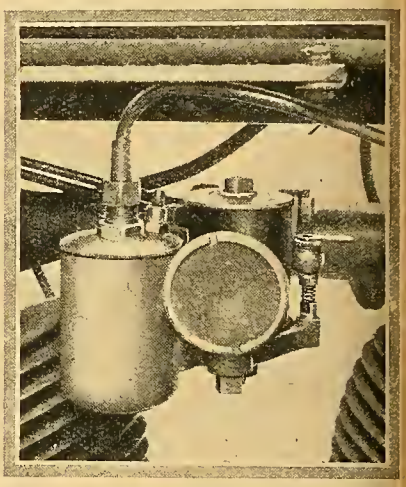
now brought thoroughly up to date, and for the first time equipped with a three-speed hub. Both models are fitted with comfortable Lycett saddles, and Brown and Barlow carburetters of the tapered needle type. Another point well worthy of comment is the low saddle position adopted on the two models.

THE CLYDE.

OUR older readers will remember the Clyde as being one of the first motor cycles to be fitted with a magneto. Two models are being manufactured for 1915, each with two different patterns of frame, the one having a straight top tube and low build for English roads, the other being the popular dropped frame type with 5½in. ground clearance for Colonial work. In all models the loop frame, an old feature of the Clyde, and a very excellent one, as it makes for great strength, is retained. The engines fitted are the 4 h.p. single-cylinder and 6 h.p. twin-cylinder J.A.P.'s, which are too well-known to require a detailed description. We illustrate the twin model on this page. It will be observed that the drive is by chain throughout, and that the gear box is fitted below the bottom bracket. This box contains the Jardine three-speed gear incorporating a kick-starter, and operated by a lever on the top bar, but a four-speed countershaft gear or three-speed hub gear and belt can be obtained to order. The carrier has been strengthened in view of the weights which this fitment is expected to carry in these days. Druid forks, XL'All saddle, B.T.H. magneto, B. and B. carburetter, and comfortable footboards are standard fittings. The clutch pedal is on the right and brake pedal on the left; the brake, however, operates on the outside of a dummy belt rim on the right side of the machine.

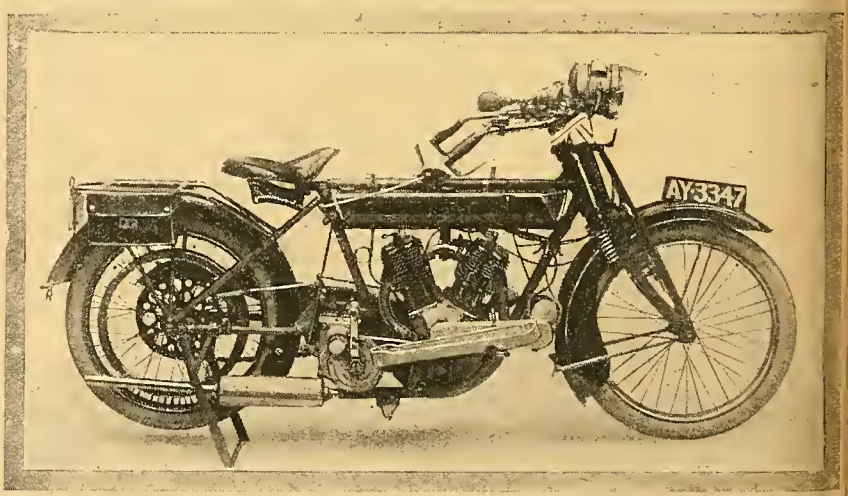
A PILOT JET SENSPRAY CARBURETTER.

ONE of the most interesting types of Senspray carburetter is that which is fitted with a pilot jet, so as to obtain the slowest possible running from any engine. In its main features, the new type closely resembles the already well-known standard Senspray carburetter, but it has one peculiar difference. This is immediately noticeable, for the axis on which the throttle and air slides rotate is vertical instead of horizontal. Between the body of the carburetter and the inlet pipe, and slightly to one side of the main pipe, lies a small chamber into which the pilot jet projects. The jet is fed from the main float chamber, and on its outer circumference a screw thread is formed. On this thread is mounted a small cone with a knurled edge for finger adjustment, a coil spring locking it in position when once set. This cone is, of course, an air adjustment,



The new Senspray carburetter fitted to a twin Rudge. Note the top feed to float chamber.

and when lowered allows a large amount of air to pass between it and the internal face of the afore-mentioned chamber. Thus, a very fine adjustment can be obtained, and we have seen a large twin-cylinder engine kept just ticking over for a considerable period without missing fire. This new Senspray carburetter has been tested for some time. It will be observed from the illustration that the petrol feed is to the top of the float chamber.

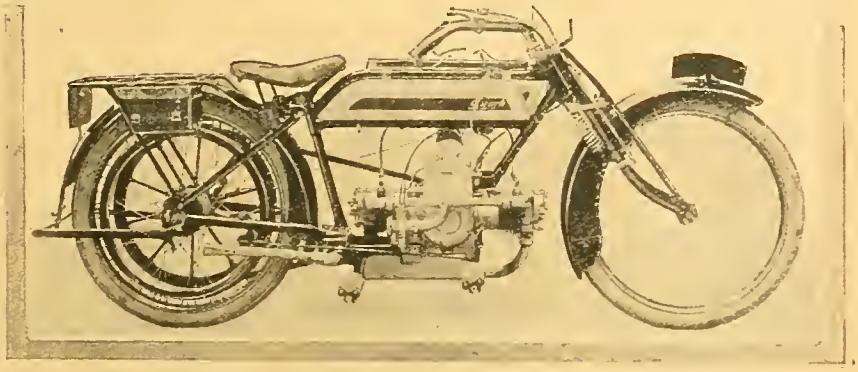


Latest 6 h.p. Clyde which is fitted with Jardine gear.

THE NEW BROUGH MODELS.

Horizontally Opposed Engines, Two or Three-speed Gear.

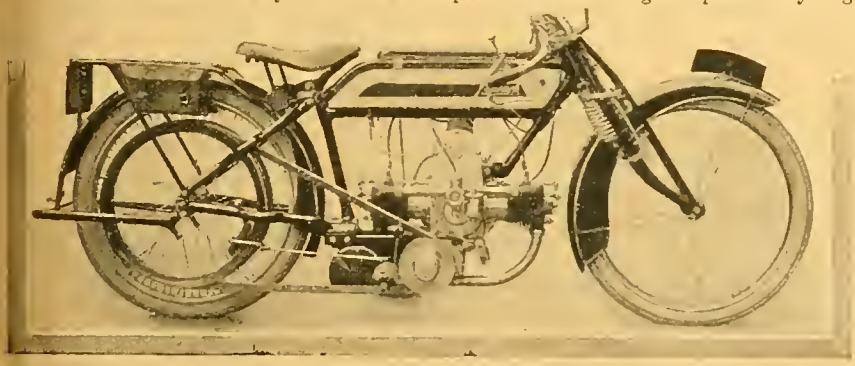
MESSRS. W. E. Brough and Co., of Basford, Nottingham, are for next year confining their attention to the horizontally-opposed twin engine of moderate power. Three models are made, which differ only in detail, each having the same power unit. The bore and stroke of the engine are 70 × 64.5 mm., 497 c.c. The valves have detachable ports, the exhaust ports being made with flanges for cooling the exhaust gases. The pistons are light and unbreakable, and fitted with three rings. The valves are placed overhead, provision being made to prevent them from falling into the cylinder in the case of breakage. The crankshaft is of high tensile steel, running on roller bearings, having balanced webs, and carrying an outside steel flywheel. The lubrication is by Best and Lloyd drip feed to the crank case, and a simple method of forcing oil at high pressure to the adjustable big end bearings is used. The engine is firmly fixed to the frame by three bolts.



The touring model fitted with three-speed hub gear.

It is readily removable, but the cylinders can be detached for cleaning purposes without removing the engine.

Model H S is fitted with a Brough two-speed counter-shaft gear operated by dog clutches fixed under the engine crank case, forming one unit with the engine, and giving ratios in the proportion of 3 to 2. The transmission is by chain from the engine to the counter-shaft, thence by John Bull rubber belt to the rear wheel over an adjustable pulley, which gives a top gear range of 4 to 6½ to 1. A large and efficient silencer is supplied, but no clutch or kick starter is fitted



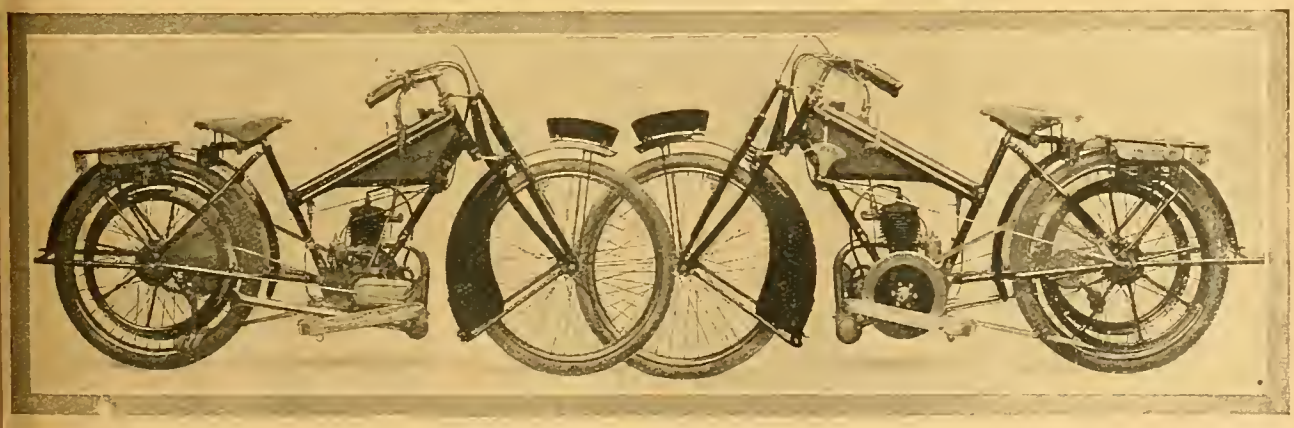
The new racing model horizontal engined Brough

Model H B is for the most part similar to that just described, but is fitted with a Sturmey-Archer three-speed hub, ratios 4, 6½, and 9¾ to 1, and handle starter. The tank capacity of both models is 1¾ gallons petrol and three pints of oil. This machine having a ground clearance of six inches is suitable for use Overseas.

Model H T T is practically identical with H S, but is fitted with a specially selected engine, having light steel pistons, high compression, and extra lubrication to the front cyliuder. A speed of sixty five miles per hour is guaranteed.

ANOTHER LADIES' MOTOR BICYCLE.

A RECENT adoption of the Ivy two-stroke is the neat open frame model depicted herewith. The engine is either the 70 × 70 mm. or 64 × 70 mm. two-stroke, and single-geared, two-speed hub, or two-speed counter-shaft geared models may be obtained. The framework is very neat and strong. A duplex top tube is employed, between which the tank is fitted in a manner which gives a most pleasing appearance The all-important question of comfort and cleanliness has been carefully studied, and the wide guards, the transparent celluloid dress-guards, and the substantial footboards all help this ideal without in any way detracting from the appearance. The Ivy two-stroke does not employ Petroil lubrication, but a Best and Lloyd sight feed drip supplies oil direct to the crankshaft bearings, so that there is but little chance of oily vapour blowing back through the carburetter.

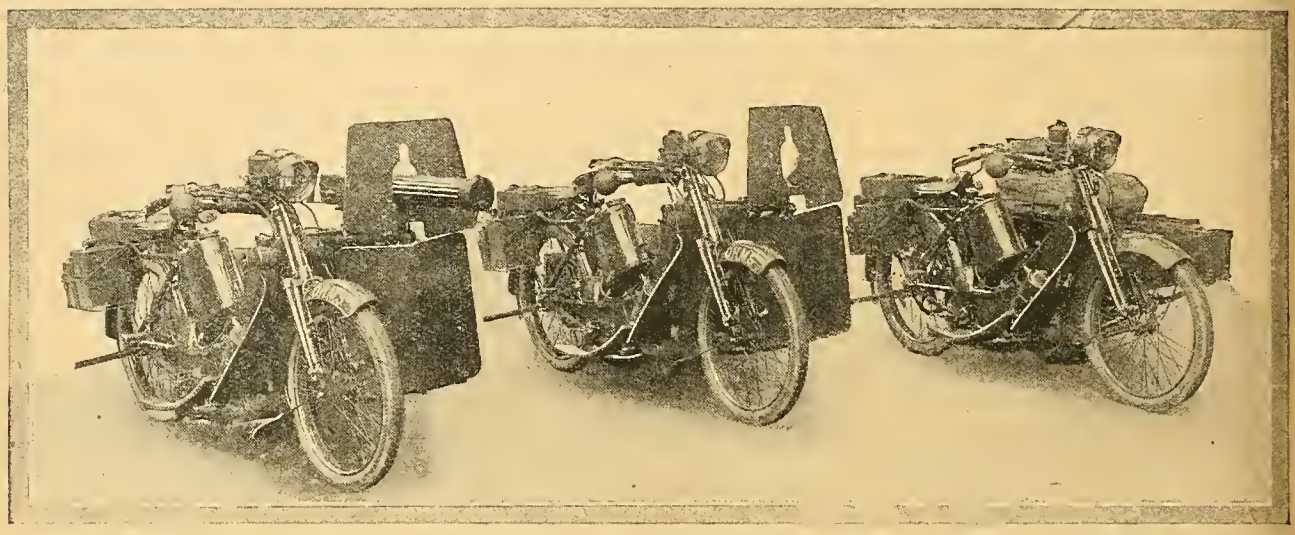


Both sides of the ladies open frame 2¼ h.p. Ivy.

SIDECAR MACHINE GUN BATTERIES.

FURTHER OFFICIAL RECOGNITION OF THE MOTOR CYCLE.

EVERY DIVISION OF THE ARMY TO HAVE ITS SIDECAR MACHINE GUNS.



The Scott sidecar machine gun battery. One sidecar carries a quick-firing gun; there is a spare machine ready fitted up for the gun, and still another carrying ammunition and baggage. (*Passed by the Censor.*)

A MACHINE gun mounted on a motor cycle is no new thing—one was shown attached to a Scott bicycle at the Olympia Show two years ago—but its merits are now being recognised more than ever before. Batteries are being formed, consisting of sixty-four non-commissioned officers and men, who will be equipped with quick-firing guns mounted on Scott and Enfield sidecar machines. Every division of the Army is to have one of these motor machine gun batteries.

The Times of November 24th contained some interesting notes on the employment of motor cycle machine guns. The writer states that he learnt some interesting details from an officer of the motor section. "In the opinion of my informant," he says, "the bicycle is superior in general utility to the car. A powerful armoured car fitted with a long range gun is seriously handicapped by its very qualities. To carry a weapon of calibre commensurate with its size, the car must be fast and powerful, and therefore bulky. It is undesirably visible, and it is unwieldy for the simple reason that, in the roads of Flanders, it takes a very appreciable time to turn round." . . .

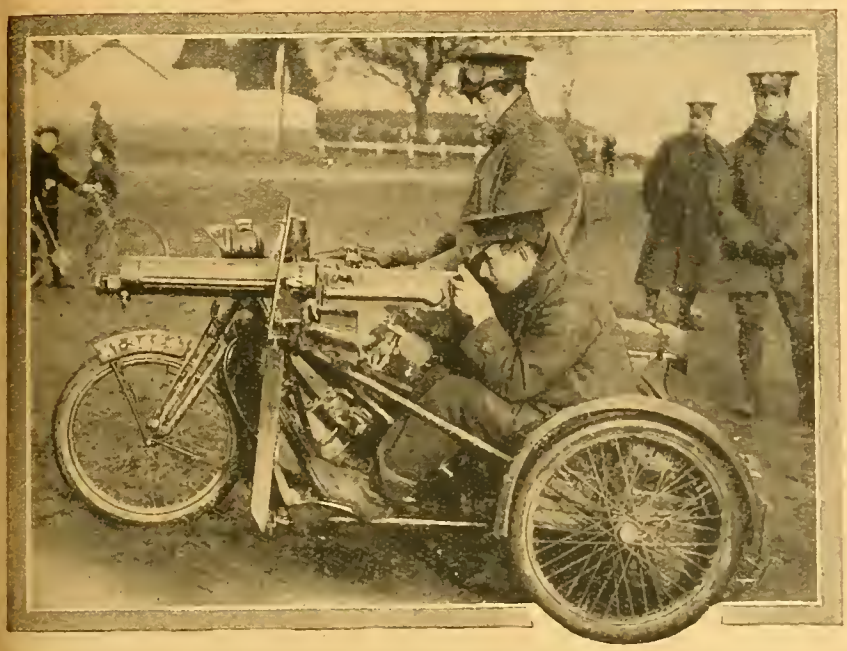
Advantages of the Mobile Motor Cycle.

"The motor bicycle, armed with a small quick-firing gun, such as is extensively used by the enemy, is a weapon of apparently much greater possibilities. It is very small, approaches invisibility as nearly as can be, and, taking advantage of the trees lining every road, can make long surprise rushes, deliver its attack, and return in safety." . . .

"A clever rider (and marksman) can do an immense amount of damage in a few minutes with one of these machines. As soon as he reaches his point of attack, he dismounts and tilts the machine slightly to the left, bringing the quick-firing gun into proper position for manipulation. A good man can sweep a patrol or a transport convoy, and be mounted and on his way back again at 50 m.p.h., almost before the attacked party are aware of his existence." . .

The writer concludes as follows: "Great Britain builds the best motor bicycles in the world, and numbers most of the best riders. A well-trained corps of experienced men, taught to handle a light machine gun, might well prove an invaluable addition to our arms."

Practising firing at full speed on the road.



Frank Cody (son of the late Colonel Cody), who is driving one of the Scott sidecar machine guns, and his gunner. (*Photograph passed by Censor.*)

The New Motor Cycle and Sidecar Battery.

Such a corps, as we have said, is now in training at Bisley, but the guns will not be mounted on motor bicycles as *The Times* writer appears to imagine, but on the chassis of sidecars attached to motor cycles. One man will look after the gun and fire it either from the sidecar or quickly dismount the tripod and gun and convey them over ploughed fields or such like should necessity arise. The batteries will be attached to the Royal Horse Artillery and Royal Field Artillery, the pay being the same as in these units. A quick-firing gun on the handle-bar of a bicycle would be a very unstable arrangement, and render steering difficult, especially on greasy and damaged roads. The sidecar is almost, if not quite, as mobile and as easily turned in a narrow roadway; the gun would be ready at a moment's notice without any preparation, and a much greater quantity of ammunition could be carried.

A Coventry Battery.

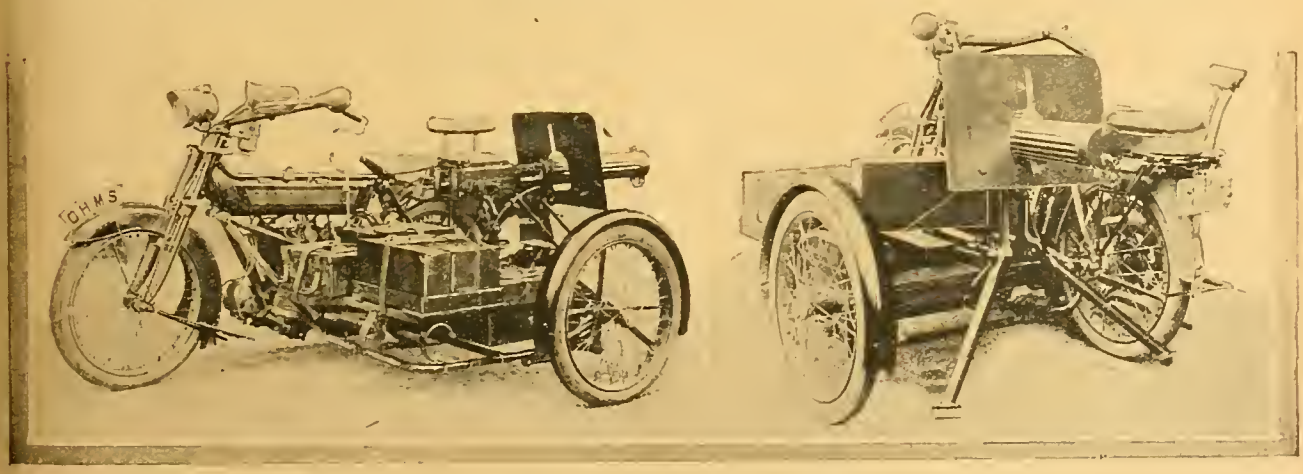
The idea of a sidecar machine gun battery appeals to many sporting motor cyclists, who have readily offered their services. Recruiting has been assisted, too, by the authorities permitting sections of friends to work together. The idea of a Coventry battery occurred to Captain J. E. Alkin, who hails from Atherstone, and has been appointed commanding officer of one of the new batteries, and he approached Mr. Geoffrey Smith (the Editor of *The Motor Cycle* and the honorary secretary of the Coventry and Warwickshire Motor Club), through Mr. Victor Riley, and a splendid response has been received to the local club's appeal for recruits. There were thirty-four vacancies, and over seventy applied. One member, too old to be accepted, afterwards sent a cheque for £9 to the hon. sec. to be spent in comforts for the men selected. Among the first accepted were J. Cocker (Singer and Triumph rider), W. A. Davenport (Lea-Francis rider), C. Allison (Colmore depot), and J. H. Pountney (Rover). On Monday the Coventry battery (which is to be known as the 5th Motor Machine Gun Battery) left for Bisley, marching through the streets of Coventry headed by a band. They were given an enthusiastic send off. After becoming proficient in the handling of a machine gun at Bisley—it is said that a mechanically-minded man can become an expert shot in a month—the men will be sent over to France, and can be relied upon to give a good account of themselves.

Some Particulars of the Machines.

A large number of Scott and Enfield sidecars, to which the quick-firing guns are attached, are now being delivered. Their design is well-known to our readers. The principal features are as follow: Both machines are fitted with chain drive, two-speed gears, and twin-cylinder engines, the Scott engine being a two-stroke of 532 c.c.; the Enfield is fitted with a 6 h.p. J.A.P. 770 c.c. engine. That both are well-tried and reliable machines goes without saying, otherwise they would not have been selected for this very important work.

Each motor machine gun battery consists of sixty-four men, though six extra men are kept in touch. There are six gun teams, each team having three motor cycles and sidecars—one carrying a gun, another gun mountings (but without a gun) to take the place of the former in case of necessity, and the third carrying ammunition and other necessary impedimenta. There are six riders of solo machines in close attendance, who act mainly as scouts, three mechanics, and nine car drivers with ammunition, etc., making up the total.

We regret to announce that Leonard A. Filleul, of Monkton Combe School, has been killed in action.



Two aspects of the 6 h.p. Enfield sidecar machine gun which is arranged to fire rearwards.

Bristol M.C.C. Open Eighteen Hour Trial.

RAIN, MUD, HILLS, AND FOG.

OF the twenty-five entrants for this strenuous event, which took place on Friday and Saturday last, only three failed to face the starter at the Queen's Hotel, Clifton, and these were P. Grout, F. C. Wasley, and L. Martin. The first man was sent away at 9 p.m. to make his way to Porlock, *viâ* Cross, Bridgwater, and Williton at his own gait. Muddy roads were the order of the night, but a clear sky compensated somewhat for the adverse surface.

W. H. Rudge (3½ Wolf) and H. W. Walker (2¾ Douglas) were among the absentees at the Ship Inn, and A. Stevens (3½ Zenith) broke a belt on the hill and retired; but, with these exceptions, almost everyone arrived safely at the top of Lynton Hill. Both Porlock and Lynton had long stretches of loose stones, which caused a few dismounts. A time check had been arranged at the top of the latter hill, but as the checker found trouble on the way to his post it was abandoned in favour of a "control."

The Rain Begins.

The road from Lynton to Launceston produced no very important incident save that the weather began to break and heavy rain fell. Eight competitors were missing at the Launceston time check, though of these D. Hawkes (8 Victor c.c.), H. Greaves (8 Enfield sc.), H. Petty (3½ Brough), W. McVeggie (3½ Brough), and G. E. Radley (3½ Burford) appeared once more at Exeter. The arrival of Hawkes was particularly welcome, and both his Victor and Clayden's A.C. had been running well and made fine ascents of Porlock and Lynton. Unfortunately, however, the fact that Hawkes lost his way put him out of the running. The weather conditions were by now awful, and Dartmoor was crossed in fog and rain. Speed became a matter of impossibility, and with the exception of George Brough (3½ Brough) and L. Clayden (A.C.) everyone met his Waterloo, for at Exeter these two alone checked in within the maximum time limit. Of these Brough was within the necessary five minutes and thus still qualified for a gold medal, but Clayden exceeded the time by two minutes, and had to be content with his chances of a "silver."

Welcome Daylight.

After 189 miles in the dark and rain, a breakfast halt of one and a half hours at the Bude Hotel, Exeter, formed a welcome rest. After this the two once more set out, followed, after a long interval, by a few of the keenest competitors, who continued in spite of having lost all chance of awards. The weather had improved considerably, and it was a great relief to see daylight once again. There were still serious hills to be encountered at Sidford and Lyme Regis, but for those who had safely overcome the difficulties of the night there was but little fear of failure. Both checked in on time at Lyme Regis, and after that there was little of interest in the long and rather dull route back to Bristol *viâ* Dorchester, Blandford, Shaftesbury, Frome, and Bath. Competitors were obliged to sign on at Blandford and Frome, and finally at the Queen's Hotel once again. Both Brough and Clayden arrived safely at the finish, and were followed by some nine or ten enthusiasts, who straggled in at intervals.

Hard-earned Awards.

The highest praise is due to both the medal winners. Brough's performance is little short of miraculous, for the darkness, hills, and road surfaces, which were in places almost a foot deep in grease, were enough to deter the boldest solo rider and spoil his 20 m.p.h. average. Only a hardened rider such as George Brough on a really first-class machine could have accomplished such a task. Ludlow Clayden's performance is almost equally meritorious, for, though he had the advantage of the comfortable little four-wheeled A.C., it is no child's play to bring a light car

W. H. Egginton, H. Greaves, and C. Norrington, all on Enfield sidecars, passing through Lyme Regis.

Bristol M.C.C. Open Eighteen Hours Trial.—

through, under such circumstances, at an average speed of 20 m.p.h. The driver is a member of the staff of *The Light Car*, and, though his experience of automobile engineering is a comprehensive one, he is a newcomer to competition driving, which renders his performance all the more meritorious.

NOTES ON THE TRIAL.

Many eventually lost any chance of an award through missing the way between Bideford and Exeter. To average 20 m.p.h. up Porlock, down Countisbury, and up Lynton was asking too much, especially for solo riders. The road between the top of Porlock and Countisbury was very treacherous, large patches of unrolled stones being suddenly encountered without any warning red lights. The greater part of Countisbury was covered with unrolled stones continuously.

The new three-speed 4 h.p. Douglas with sidecar attached made its *début* in this event but unluckily went astray.

Heath and Dudley were riding 1915 Sunbeams, the former a 6 h.p. and sidecar, and the latter a 3½ h.p. solo. Although Heath's machine, which was fitted with the new leg guards, appeared to be geared rather low, it had quite a good turn of speed, the engine being able to "rev." for miles on end, without overheating.

During the first part of the route we noticed that the signposts were in course of being repainted, and when we passed them they were all white. However, this part of the course was over main roads, so that it did not trouble the competitors very much.

Creak Davies (Chater-Lea sc.) had a puncture in his sidecar tyre soon after Lynton Hill, and then one of his generators burst.

P. Matthews had the misfortune to split the pulley of his Norton, which, of course, caused his retirement.

We passed Harold Petty (3½ h.p. Brough) stopped just round the first corner on Porlock and did not see him again. His machine was fitted with a hand-controlled clutch.

Both Egginton and Greaves were riding 1915 Enfield sidecar combinations complete with Lucas lighting outfits and 8 h.p. J.A.P. engines.

The trial accounted for at least one broken frame, to which a sidecar was attached.

Radley's Burford, which looked very smart, being a brand new machine, was fitted with handle-bar controlled clutch, and climbed both Porlock and Lynton non-stop. This speaks well for the engine as it had no running in whatever. Unfortunately Radley was misdirected by the police in Bideford together with four or five other riders, which caused them all to miss the Launceston check.

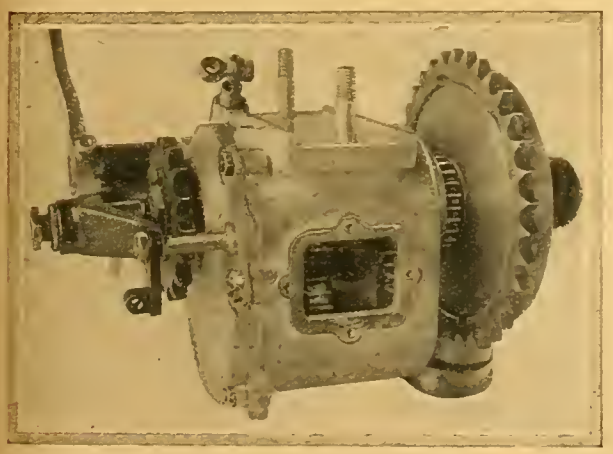
Phillips and Ball were mounted on three-speed Douglases, but, unfortunately, lost their way on Dartmoor in the fog.

The trial was undoubtedly a very sporting one, but the average of 20 m.p.h. was rather too high for safety in some places, and a gold medal was considered a 60 to 1 chance from the outset.

A. Ludlow Clayden's sporting model A.C. looked very smart indeed. The driver relied solely on his Avon combinations on the hills, not using Parsons chains, as might have been expected.

SURVIVOR OF THE ALL-NIGHT TRIAL IN THE WEST COUNTRY.

G. Brough (3½ h.p. Brough), who was the only competitor to arrive at Exeter to time.



The 1915 Sunbeam gear box, which is much stronger than formerly.

AN OPEN TRIAL IN IRELAND.

The committee of the Dublin and District Motor Cycle Club, at its meeting last week, decided to hold an open reliability non-stop trial from Dublin to Roundwood, Co. Wicklow, on Boxing Day. The committee had also before it the question of next year's competitive programme, and after a full discussion of the subject it was decided that it should be carried out as usual. The committee was influenced in its decision by the fact that the complete stoppage of competitions would cause an injury to a big national industry. The annual dinner of the club will be held on the 19th inst

Accessories and Equipment Issue.

A Special Issue of "THE MOTOR CYCLE" will be published on Thursday next, 10th inst., devoted to Accessories, Tyres, Clothing, and Equipment generally.

SOME NOTES ON GEARING.

Interesting Contrasts between the Power of Humans and Motors.

IT is customary to speak of a motor cycle as being geared 4 or 5 to 1. This method of stating the gear ratio is simple and easily understood, but it is open to one or two objections; for instance, if it is required to know the speed which can be attained, we must also know the number of r.p.m. at which the engine is running and the diameter of the driving wheel. These facts having been ascertained, the speed can easily be calculated from the formula

$$\text{m.p.h.} = \frac{D'' \times (\text{r.p.m.}) \times 3}{1000 \times \text{gear}}$$

This formula can also be stated in the following forms for the purpose of finding the gear or r.p.m.:

$$\text{gear} = \frac{D'' \times (\text{r.p.m.}) \times 3}{1000 \times (\text{m.p.h.})}$$

$$\text{r.p.m.} = \frac{1000 \times (\text{m.p.h.}) \times \text{gear}}{D'' \times 3}$$

D'' = diameter of driving wheel in inches.

Example:

$$\text{m.p.h.} = \frac{26 \times 2000 \times 3}{1000 \times 4\frac{1}{3}} = 36$$

when the gear is 4⅓ to 1, the wheels 26in., and the engine turning at 2,000 r.p.m.

In my opinion a better plan would have been to state the gears in m.p.h. either at the normal speed of the engine in question or at a fixed speed of, say, 1,600 r.p.m.; but we have become accustomed to the other plan now, and probably a change is neither possible nor desirable.

In many variable gears the reduction is stated to be so much per cent.; this usually means a percentage reduction in speed thus:

High gear × 100 = low gear × (100—x), x being the reduction in question, or, low gear = $\frac{\text{high gear} \times 100}{100-x}$

for example, if the reduction be 50% and the high gear 4 to 1, low gear = $\frac{4 \times 100}{100-50} = 8$, but a 50% difference might be taken to mean gears of 4 and 6 to 1, which is an addition of 50% to the high gear ratio. This, however, is not the usual method of reckoning.

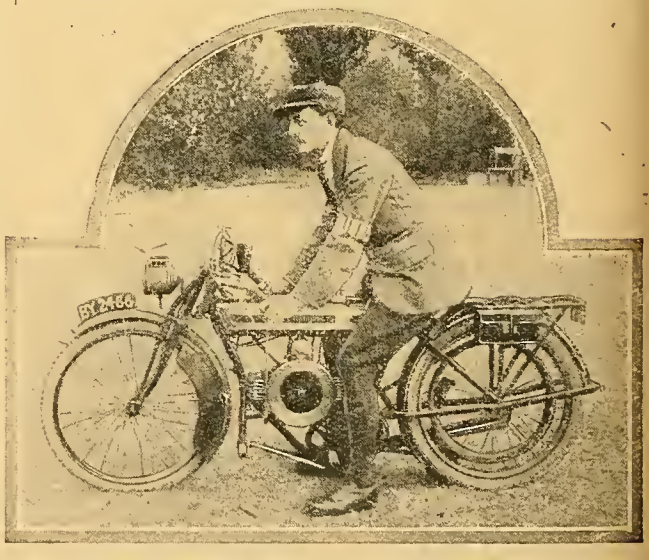
The Case of the Pedal Cycle.

To find the gear of a chain or shaft-driven machine, multiply the number of teeth in the driven members together and divide the result by the product of the teeth in the driving members. In the case of a belt-driven machine it is best to mark the pulley and turn the driving wheel through one revolution and count the revolutions of the pulley (the gear will be very slightly lower than this figure, as the belt will bed lower in the pulley when the engine is running).

In pedal bicycle practice quite a different, but in some respects superior, method is adopted. It is customary to speak of a bicycle being geared, say, to 72, which means that it will travel as far at every complete turn of the pedals as a 72in. wheel will in one revolution (nearly 19ft.); during this time two power strokes are applied, one with each foot. If motor cycle gearing were quoted in the same terms, we should find that a machine with a 4⅓ to 1 gear ratio and 26in. wheels would be geared to 6, which, in comparison with a pedal cycle, seems ridiculously low, but a few moments' consideration will show that the difference is not quite so marked as it sounds at first. The cycle travels 72π inches at each complete revolution of the motor (in this case the rider's feet), and the motor cycle 6π inches, but, as before mentioned, the cycle receives two power strokes per revolution and the motor bicycle one power stroke per two revolutions; therefore, the cycle travels 36π inches per stroke and the motor cycle 12π inches. One stroke of the foot, then, carries the machine three times as far as one stroke of the motor, provided that a single-cylinder engine be used.

Human and Mechanical Motors Contrasted.

It may be interesting to carry the comparison a little further. Not many riders are capable of more than 20 m.p.h. (at any rate for more than short periods under favourable conditions); to accomplish this speed the feet must make 92 r.p.m. with a machine geared, as in our example, to 72, whereas the motor cycle (gear 4⅓ to 1) will attain the same speed at 1,100 r.p.m.—less than half of what the engine is easily capable. From this we see that a cyclist is essentially a low speed motor and a motor cycle engine a high speed one, and that it is owing to its speed that the motor cycle engine is able to develop the remarkable horse-power of which it is capable. A cyclist, weighing 12 stone, riding a 32 lb. machine up a hill of 1 in 10 at 6 m.p.h. exerts .32 h.p., wind resistance, which is practically nil at so slow a speed, being ignored; and if the speed be 10 m.p.h. the required horse-power will be .53, and a man must be a good rider to keep this up for long, but a 500 c.c. engine is capable of exerting about ten times this h.p. for extended periods. AURIGA.



Cecil Friend-Smith, of the Croydon Special Constabulary, who finds his Douglas very useful for police work in that district. The armlet denotes he is on duty.

π is the ratio of the circumference of a circle to the diameter and is equal to 3.1416 approximately.

THE MOTOR CYCLE AND THE WAR.

A Wounded Despatch Rider.

R. S. Douglas, a despatch rider, whose mount is a Rudge, has just returned invalided from the Front. This rider was awarded the Médaille Militaire for valour before leaving France, and the medal was pinned on his breast by General Dorrien on behalf of the French Government.

The Canadian Motor Cyclist Corps.

It will be remembered that the first Canadian contingent was accompanied by a section of thirty-two motor cyclists, but so useful have riders proved themselves that the next contingent, though not quite half the strength of the first, will have no fewer than 200 riders. The commander of the motor cycle division will be Major Denison, and he will direct operations from a sidecar. A special uniform consisting of sheepskin-lined Norfolk jackets has been adopted. The riders are at present practising over ploughed fields, etc., and snow-covered roads will form another test as soon as the cold weather sets in.

Official Praise for Despatch Riders.

In Sir John French's latest despatch the following paragraph appears, and though "cyclists" are referred to, it would seem likely from the description of the work performed that the remarks really apply to the motor cyclist despatch riders:

"I am anxious in this despatch to bring to Your Lordship's special notice the splendid work which has been done throughout the campaign by the Cyclists of the Signal Corps.

"Carrying despatches and messages at all hours of the day and night in every kind of weather, and often traversing bad roads blocked with transport, they have been conspicuously successful in maintaining an extraordinary degree of efficiency in the service of communications.

"Many casualties have occurred in their ranks, but no amount of difficulty or danger has ever checked the energy and ardour which has distinguished their Corps throughout the operations."

Croix Rouge Francaise.

The total amount received in subscriptions by the British Ambulance Committee to the French Red Cross Society is now considerably over £16,000. From all parts of the Kingdom contributions and offers of cars continue to be received. Lest the object for which the fund was organised should be forgotten, it is perhaps as well to point out that it is to make up the deficiency in the number of cars available for ambulance work in France. By this means it is hoped to obviate the delay in transport from the front which has resulted in much suffering to the wounded. The fact, moreover, must not be overlooked that the line held by the French is of such extreme length and the roads in such bad condition at this time of the year, that the efforts of those engaged upon the humane work of removing the wounded are extremely great, and it has in many cases temporarily broken down. All cars offered to the Committee must, of course satisfy certain standards in point of size and equipment. The Committee's appeal is for both cars and money to run them. For days past the honorary secretaries to the Committee, Mrs. G. Cecil Baker and Mr. B. Peyman, have been besieged at Wimborne House, Arlington Street, Piccadilly, by a large number of generous persons only too anxious to help.

An Adventurous Night.

A soldier writes from France: "A scout attached to our convoy yesterday had a most adventurous time. Captured one night—escaped—then stole a German's motor bike—and hopped it. The cylinder blew out and blew him up. The scout then walked seven miles to the English lines. What a picnic!"

Success of the Motor Cycle.

The Standard says the motor cycle is dependent on good roads. No one can say that the roads in the military area in France are good at the present time. It would be more correct, therefore, to say that the motor cycle is, rather, dependent on hard ground, as under certain conditions it may be even used across country. There is no doubt however, that the motor cycle has, in the words of our correspondent, "come into its own," as far as its use in warfare is concerned.

A SCOTT SIDECAR MACHINE GUN IN ACTION.

An article on the subject of the new motor machine gun batteries is published in this issue. Every division of the Army is to have its sidecar machine guns.

Overall Suits Wanted.

Any readers who have serviceable khaki-coloured motor cycle waterproof suits to spare are requested to send them to Miss Elizabeth Schofield, Shoebury Cottage, Shoeburyness, Essex, who will forward them to the Motor Transport Army Service Corps.

Concert in Aid of Belgian Fund.

The M.C.C. smoking concert in aid of the Belgian Relief Fund proved a great success. The large hall at the Café Monico, London, W., was well filled with members and friends, who seemed thoroughly to enjoy the pictures provided. Lantern slides embodying advertisements resulted in £21 extra for this worthy fund. The M.C.C. bore the expenses. A further concert is to be held by the same body on December 11th. Tickets, 1s. each, may be obtained from Mr. W. H. Wells, 366, Euston Road, N.W.

How the War Funds Stand.

The totals of the principal war funds, as enumerated below, stood as under on Tuesday last:

	£	s.	d.
H.R.H. Prince of Wales's National Relief Fund	3,983,000	0	0
H.R.H. Princess Mary's Fund to provide Christmas Gifts for Soldiers and Sailors	107,404	0	0
The Queen's Work for Women Fund	93,428	0	0
The Times Fund for Sick and Wounded	684,017	8	6
Daily Telegraph Belgian Relief Fund	75,324	1	11

The Grand Prix of Australia.

The Grand Prix of Australia, organised by the M.C.C. of Melbourne, proved a thrilling event. It was held on October 5th over a winding course of fifteen and a half miles per lap, and nine laps had to be completed. The road surface was good, but punctures were frequent, and tyre trouble was responsible for almost all the delays. The race was an open event, but the course slightly favoured light machines, which equalised matters considerably. E. Meller, the winner, rode a 2¾ h.p. Douglas, and put up an excellent average of 41.3 m.p.h. D. McFarland came home second, winning the trophy presented by Milledge Bros. N. Suiden finished third (Bennett Barkell trophy), and J. Meller fourth. The course is known as the Yetholme-Sunny Corner course.

Directors' Report.

The statement of accounts of the Bowden Brake Co., Ltd., Tyseley, Birmingham, shows the net profits for the year ended August 31st to be £2,458 1s. 11d. as against £1,198 1s. 5d. for last year. From these profits the directors propose to pay dividends on the 6% preference shares, and to place £1,000 on the reserve fund to cover possible losses caused by the war.

Military Motor Cyclist's Wedding.

A S.E. motor cyclist, who rides a Triumph, and is at present serving in the Home Forces, is to be married shortly to a young lady rider, who owns a two-speed Douglas. It will be a military motor cyclist's wedding. The motor cyclist, who hopes to obtain extended leave, will drive to the church in uniform. The bride elect will be attended by another lady rider, and several motor cyclists will be amongst the invited guests. The wedding—a quiet one—will take place at a church in South London, where the banns have been read for the first time.

Canadian Motor Cycle Firms.

Despite wartime activities and confusion, the members of the Canadian motor cycle trade are sticking to business. Recent issues of the *Canada Gazette*, the official newspaper of the Government, contain the announcement of the incorporation of two companies, which have been organised for the purpose of manufacturing motor cycles or accessories and supplies. The one is the Essex Motor Cycle and Machine Co., Ltd., of Essex, Ontario; the other concern is the Superior Tube and Accessories, Ltd., Toronto. The latter firm is to make accessories, tyres, and parts.

The Essex Co. is one of the first, if not the first concern to be incorporated in the Dominion for the express purpose of turning out motor cycles.

Canadian Motor Cycle Shows.

The motor trades of Canada are facing a predicament in respect to the holding of the annual shows in the various cities early in 1915. The armories and various public buildings formerly used for the motor exhibitions are occupied by Canadian soldiers in training for the European War, and no structures are available for show purposes in many places. On this account the long-established annual Toronto show fixture has already been called off for 1915, but preliminary arrangements are being made by the motor cycle dealers of Toronto to stage a co-operative and exclusive motor cycle display in a convenient office building or warehouse. The Montreal show is to be held as usual, starting January 23rd, but it is to be placed in a large dock warehouse on the river front.

French Roads Impassable for Cars

We have received a postcard from Vernon Taylor, on which he says: "Many thanks for sending out *The Motor Cycle*. I may say it is greatly appreciated. You cannot understand what the roads are like here; some impassable for cars even now."

A Chain-driven Rudge.

In addition to the Rudge models for 1915, described on pages 593-4 of our last issue, a 7-9 h.p. chain-driven machine with three-speed countershaft gear is to be added to the range. This newest design Rudge will not, however, be ready for delivery until February.

Exports from America.

That the United States motor cycle industry is feeling the effects of the great war is shown by the August export figures. These indicate that, whereas in August, 1913, 238 motor cycles were exported, only 186 were exported in August of this year. This inclines one to modify one's views on the proposed capture of British Overseas trade by our friends across the Atlantic about which we have heard so much of late

Horizontal Twins.

Is there anything in the air of the west country that affects the horizontal twin? The most famous producers of that type of engine have their works near Bristol, and now George Brough, on his 3½ h.p. horizontally opposed twin Brough, is the only solo rider to survive the Bristol M.C.C. trial. In truth, this must have been something to do with the rider whose feats are already well known, but much must be said for the machine, with its even impulse and consequent steadiness and excellent torque. The horizontal twin proved itself some time ago by the success of the little Douglas, but as time goes on we find more and more manufacturers adopting the design which has so satisfactorily proved its worth.

Rear Lights.

Yet another fatal accident has been caused by the absence of properly placed rear lights on a dray. At the inquest on the victims, C. Hirst and G. E. Gray, the Coroner made some valuable remarks upon the advisability of having all slow-moving vehicles lighted with an independent red light *in the rear*, as the lamp placed in the front of a waggon might easily be invisible from behind. We have, as our readers know, often urged this in our columns. The verdict was one of "Accidental death," though the Coroner had observed "My own idea is that these carters had had far too much to drink." *The Wakefield Express*, commenting on this, says: "How many more lives must be sacrificed before the authorities will move it is impossible for us to estimate."

The Latest in Milestones.

A unique milestone has been set up outside a Barnes garage. The distances marked on this are Berlin 743 miles, Tipperary 323¾ miles, and a finger post above directs the way to Potsdam.

Why an Engine Konks.

The discussion on the subject of engine konking is being continued with vigour in our Correspondence columns, and many and varied are the opinions of the true cause of the noise which emanates from the engine.

1915 Models.

We continue our descriptions of 1915 model motor cycles in this issue, and more will be ready in time for our special Equipment Number to be published on Thursday next. Two or three entirely new designs by prominent makers have still to make their appearance.

The Trade in Motor Cycles.

The very fact that practically every motor cycle manufacturer has produced a 1915 model motor cycle embodying improvements as experience dictated proves to some extent the amount of life in the industry. From several quarters lately we have heard of an increase in the demand for motor cycles.

All-British Christmas Shopping.

The Union Jack Industries League, the originators of All-British shopping weeks, announces a national All-British Christmas shopping campaign, commencing on Monday, December 7th. This seems to us more desirable than usual at the present time. Shopkeepers wishing to take part should communicate with the organising secretary, 79, Fetter Lane, Holborn, E.C.

Motor Cycle Manufacturers and the War.

Those enterprising manufacturers who have devoted their energies to the application of their motor vehicles to warlike uses are now reaping their rewards. An article urging manufacturers to pay attention to the possibilities of adapting their vehicles to special uses appeared in this journal on the outbreak of war—there is still room for improvements and further extension of the scheme.

The Bristol M.C.C. 18 Hour Trial.

The Bristol Motor Cycle Club's open eighteen hour trial, which is described in this issue, was a most strenuous affair. Apart from the appalling surfaces and weather, the route and nature of the trial were sufficiently arduous to cause many casualties. All this makes the performances of Brough and Clayden the more meritorious, and it is a curious point that neither of these successful competitors was a local man, though local knowledge should have been a great advantage.

Cycle and Motor Trades Benevolent Fund.

The monthly meeting of the Executive Committee was held on the 26th ult., Mr. F. S. Bennett in the chair. The treasurer's report showed a balance at the bank and in hand of £1,517 0s. 8d. It was felt to be a matter of congratulation that in spite of the very numerous and heavy demands on the fund during the last few months all claims were met without its being necessary to disturb investments.

The Institution of Automobile Engineers.

The next meeting will be held on the 9th inst. at Storey's Gate, St. James's Park, S.W., at 8 p.m., when a paper will be read entitled "Benzol, Alcohol, and Mixtures of these Liquids with Petrol as Fuels for Internal Combustion Engines," by Prof. W. Watson, D.Sc., F.R.S. The paper is the result of some very interesting experiments with mixed fuels recently carried out by Dr. Watson and his assistants, and a card of invitation to the meeting may be obtained by those interested in the subject on application to the secretary of the Institution of Automobile Engineers, 28, Victoria Street, Westminster, London, S.W.

A.A. and M.U. Notes.

ROAD SIGNS FOR SCOTLAND.—The Scottish offices of the A.A. have recently arranged for the erection of two much-needed caution signs on the Strathdon Road, and also two signs for Roughpark village, in the same neighbourhood. Three direction signs have also been erected in Perth at the junction of the Crieff and Dunkeld roads, which should be of great assistance to motorists. Four school signs have been supplied at the request of the Glasgow Town Council, and two school signs have been supplied at the request of the Town Council of Rothes.

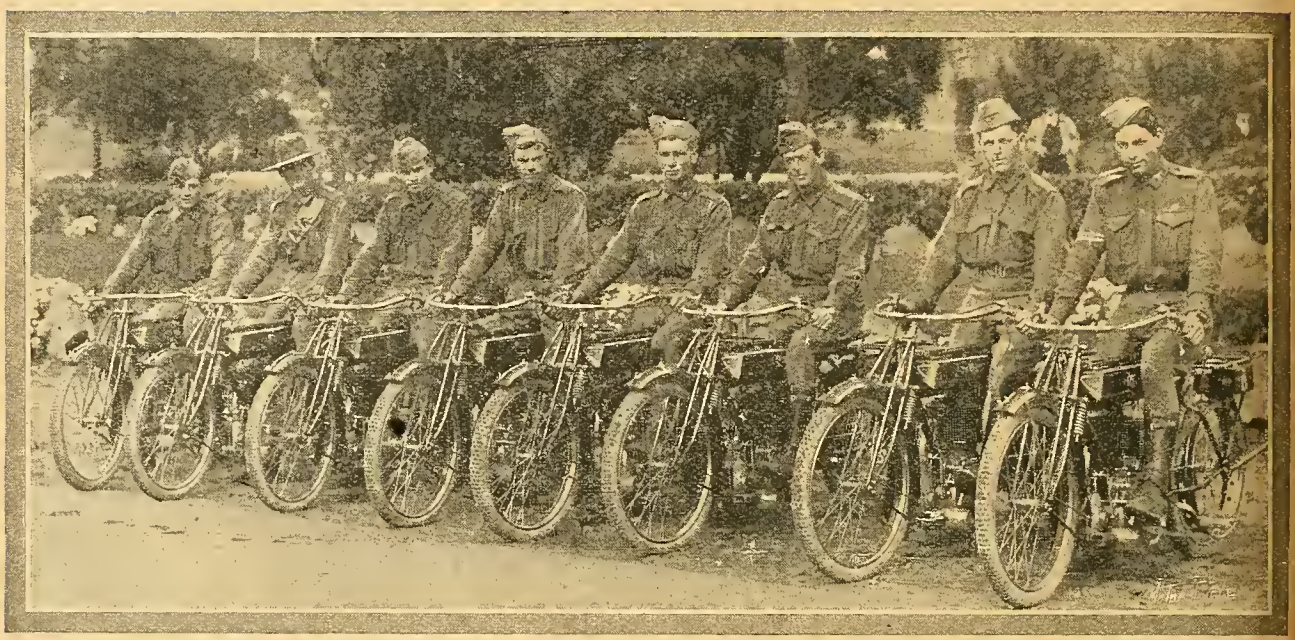
PROPERTY LOST BY MOTORISTS.—The A.A. receives every week a number of articles, such as accessories, tools, lamps, etc., found on the roads. During the past two or three weeks a noticeable increase has taken place with regard to the number of articles found, and although every effort is made to discover the owners, several still await identification by owners. Much of this "treasure trove" has evidently been lost by motor cyclists, several tool kits and belts having been sent in by the A.A. road patrols. If any motorist has during the past two or three months lost property of this description, the head offices of the Automobile Association should be communicated with. The particulars given should in every case cover a description, also the road, and date on which the loss probably occurred. The Association also invites all motorists, whether members or not, to notify such losses as soon as they happen, in case the articles lost have been found by the patrols and sent to the A.A Lost Property Department.

Trials and Despatch Riders.

There has been a certain amount of discontent regarding the choice of motor cyclists for military purposes, as it is said that the services of many experts have been refused, while certain comparative novices have been accepted. If this be the case, would it not be possible to hold some kind of eliminating test? For instance, any competitor who survives such a trial as the Bristol M.C.C. event should surely make a suitable despatch rider. Eighteen hours of rain and wind, combined with a long stretch of darkness, deep mud, exposed country, and 1 in 4 gradients, are surely as severe conditions as can be obtained in this country, and Devonshire roads are not celebrated for excellence of surface in winter time.

THE BRISTOL M.C.C. EIGHTEEN HOUR TRIAL.
P. B. Phillips and F. G. Ball on Trow Hill. The machines are Douglases.

MILITARY NOTES.



Our Overseas dominions, which are playing such an important part in the great war, recognise, as we at home do, the utility of the motor cycle in warfare. The eight Precision machines seen in this illustration are in the service of the Australian Defence Department.

Overseas Military Motor Cyclists.

A PATRIOTIC firm of Melbourne, Messrs. A. G. Healing and Company, presented the Defence Department of Australia with three of the eight Precision "Big Four" motor cycles shown in the accompanying illustration, together with an additional machine as an emergency mount, so that in the event of any machine being put out of action a duplicate is available. Frames, wheels, and tanks are of specially heavy construction. It is interesting to note that all the machines are single-geared. The firm also supplied spares, tyres, and workshop equipment to the valne of £100, in order to render the corps as far as possible independent and self-contained. Three of the riders chosen are expert motor cycle mechanics, and all put in several hours in the factory before joining, making themselves conversant with every detail.

News from the Front.

The following are some extracts from a letter written home by B. Alan Hill, a leading competition rider, now in the 4th Motor Ambulance Convoy, driving an Argyll Red Cross ambulance:

"We are having quite typical November weather—cold, misty mornings and generally bright days. In a general way we have to be up at 5.30 and wash and shave at the pump, but now that things have slackened up a bit we are able to get to bed at 9 p.m. and up at 6 a.m. I have been lucky the last few days in having a bed to sleep in. The town is packed with soldiers, and just at the moment the chief excitement is watching for aeroplanes coming over. As soon as a Taube is sighted the soldiers bang away at it for all they are worth. They have also brought a Maxim gun to play on them, but so far I have not been lucky enough to see one brought down. On Wednesday I went a journey of about twenty miles out and twenty back with several others of our convoy to get stores. It was a very interesting ride, though tricky; the roads are very highly cambered and were covered with the thickest and slimiest mud I have ever come across. It was very early when we started, and in the thick, cold mist we passed hundreds of poor devils of refugees wandering along, apparently having been out all night. The roads were simply packed with troops on the march, hundreds of transport waggons, etc., and we had a rare job to keep out of the ditches when passing them. On our return at one very bad corner a motor cyclist had a bad moment trying to avoid running into us, and as he passed I saw it was North, the Ariel rider. Curiously enough, on this same day I was hailed by a passing motor lorry in the town where we are stationed, and found C. Q. Roberts on board. He told me he was stationed at a town about twenty miles away, and that he had that day seen *The Motor Cycle* with G. T. Gray's portrait in it, and heard that I was out here. Not half an hour afterwards who should come walking up the street but the two Burneys. They only came here three days ago and may be stationed here for some time, so I hope to see them again. They seem to have had a very exciting time since they came out. I have also met Clarke, the Rudge rider. The Argyll is a splendid car, but I have had a lot of tyre trouble and have been unable to get new tyres. I saw a Humber ambulance out here. It looked very nice and quite suitable for the work. Our chaps were called out a few nights back to a town some miles distant which was being shelled by the Germans, and had the ghastly job of bringing back some poor little kids from a convent into which some of the shells had fallen. Some of the kiddies had been killed outright and some had legs and arms shattered. I am in tip-top condition myself."

The Awful Pave.

A motor cyclist writing from the Front says: "The *pavé* here is awful. One does a skating-rink touch most of the time. We are all dreading the winter. I shall have to start canvassing for woolly garments to keep myself from perishing."

Club Roll of Honour.

E. B. Howe Bruce, A. C. Carlow, P. Grosset, Wm. Walker, and Peter Cameron, all members of the Leven and Port of Fife Motor Cycling Club, are now serving as despatch riders with H.M. Forces. Mr. Cameron, who joined the R.E., left for France last week, while the others are members of the Motor Cyclist Section of the Highland Cyclist Battalion. Mr. Bruce (who is a son of Sir Charles Bruce, Bart., and a descendant of Robert the Bruce) and Mr. Walker have been promoted to lieutenancies.

O. M. Baldwin, who has raced on numerous occasions on Brooklands Track on Bat and Matchless machines, has joined the Army Service Corps Motor Transport Section as a driver, and holds the rank of corporal.

A. B. Wade, the well-known Zenith competition rider, is in France, driving a 25 h.p. Vauxhall car used by officers in the A.S.C.

TALES FROM THE FRONT.

THESE little adventures of despatch riders—D.R.'s, as they are called in military language—occurred between the dates of August 14th and September 11th, covering the period up to the triumphant battle of the Marne.

During the march from Havre to the Rest Camp in the heavy rain, one of the participants relates that "motor cyclists strewed the ditches and hedges with spanners, sparking plugs, and their own persons, but from three o'clock till eight there flowed a damp, muddy, but still hopeful, stream into the camp, only to find a marsh with tents on it and not a dry spot anywhere."

At Landrecies news of the first casualties came to hand, which included two despatch riders shot in mistake by French patrols. Another motor cyclist was hurt through coming into violent contact with a gun.

A Tale from Belgium.

This evening crowds of refugees began to arrive in a straggling stream, presenting one of the most pathetic sights imaginable. They had many extraordinary tales to tell, and, among other things, related with great gusto a tale of two despatch riders who turned and rode for safety through a squadron of hostile cavalry.

During the first taste of rain the evolutions of lorries and D.R.'s on the slimy *pavé* were most amusing to those not directly concerned. Later on, a D.R. arrived with a bullet hole neatly drilled through his haversack and another along the front of his overcoat. It turned out to be only the friendly attentions of the English sentries, but it had the effect of making one D.R. at least say "Friend" to every bush he saw for some time to come.

Experientia Docet.

Once a group of D.R.'s enlivened the somewhat gloomy proceedings by wounding four of themselves with one shot in attempting to see how a rifle worked. Experience so gained should be valuable, though the cost was rather high.

A signal office was opened in the post office, which had a back garden, with apples ripe and a stream ready to wash and shave in.

An Alarm.

Great excitement was raised by a despatch rider reporting the proximity of a body of Uhlans. All the signal office turned out with rifles, and some of the clerks formed an outpost west of the town. Great amusement was caused by the triumphant look on the faces of two Tommies who emerged from a house with two bottles of furniture polish under each arm in mistake for wine. On this day one of our corporals was sent out with a despatch and has not since been heard of.

The Major has a Narrow Escape.

Here Major —— had a narrow escape through a motor cycle stand becoming hooked up in a tree off the roof of a lorry and catching the wind screen of his car as he passed under it. However, beyond broken glass, no damage was done.

The morning was made noteworthy for the D.R.'s by a parade before General ——, who thanked them and complimented them on their services during the trying days of the retirement.

IN THE WAR ZONE.

WE recently had an interesting letter from a rider now holding the rank of second lieutenant in the Army Service Corps, who has had considerable motor cycle experience both in this country and on the Continent. He says, "We want stronger front forks, mudproof brakes, paddle off starting, a perfect clutch, engines which run more coolly at slow speeds, and no hub gears." He uses a T.T. Douglas, as it is the only machine which can be paddled off from cold, will travel five miles an hour, and yet is capable of a good speed. He also says, "It takes some good rider to patrol a convoy *en marche* on some of the roads and to come out alive. Roads and weather ——! Censor would not pass my language. Awful. Most of the machines out here have practically free exhausts, which, I think, is a great mistake, and then we have Klaxons fitted on our machines as well!"

ANOTHER LETTER FROM THE FRONT.

WE give below a couple of extracts from a letter written by Lance-Corporal S. A. Rowlandson to Mr. Pugh, of Rudge-Whitworth, Ltd.:

"Early this morning my bicycle did double service on important duty. I had a despatch for headquarters, twenty miles away. On the way I met a despatch rider with three very important messages for various divisions. The roads were swilling with mud, and it was raining hard; his magneto had given out. I took over his messages with my own despatch, left him to his troubles, and delivered all despatches. On the way back gave him his receipts and returned to the camp in two hours with my reply, and was thanked by the captain. . . .

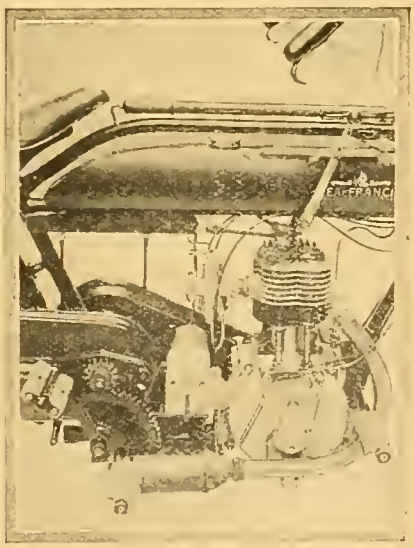
"On Thursday last I saw Lord Roberts. He died at a village, but was no doubt happy, because, at the parts he had visited, our troops were doing well, and putting the Germans to the run. The news in our quarter is very good, and a few days will see a change in the Front from what we see and hear.

"We have been quartered in some curious places—by the roadside, in parks, woods, and are now at a châlet, which is a very old building, with a distillery attached; we sleep in a loft. The convoy is very complete, and the workshops, with a very competent staff, undertake almost any job that comes along. Our officers are a fine lot.—SIDNEY A. ROWLANDSON."

CAVALRY OR MOTOR CYCLISTS.

ONLY a couple of weeks ago a well-known motor cyclist, who is now serving his country at the front, and who, by the way, was recently mentioned in despatches, wrote to us and said: "The motor cycle has now come into its own." It has truly done so with a vengeance. Daily newspapers, which a few years ago either ignored or reviled the motor cycle, now give a considerable portion of their space to the doings of our gallant riders at the front, and write in glowing terms of the utility of the machines in carrying out the duties allotted to them. In *The Evening Standard* the other night we read the following words: "A French cavalry officer returned from the front has been expressing his doubts as to the use of cavalry. He thinks it will die out as a fighting force and be replaced by motor cyclists!"

At the present stage of the movement it is not so surprising that a daily paper should condescend even to mention the motor cycle in its ordinary columns, as that a French military officer should go to the length of praising that vehicle. France was undoubtedly the pioneer country in all things automobile, but until the last few years she has practically forgotten the motor cycle, which owed so much to her in its early days. Even as late as this summer France did not take the motor cycle seriously, and that she has done so now is, without doubt, due to "our contemptible little army" and its equipment. It is hard for a mere civilian to comment on military matters, but, keen as we are on the motor cycle, we cannot see how this handy little vehicle is going to replace cavalry. Intelligence and despatch work can well be carried out by motor cycle, but we fail to see how the cavalry charge can be supplanted by its means, and it seems that this form of attack is not yet out of date. However, the French officer just referred to is delightfully enthusiastic. "Motor cyclists," he says, "will be substitutes (for cavalry) to a great extent in European warfare, and their value is not yet appreciated. Before the end of the war in the French army, and the British, too, there will be ten times the number there are at present, and I am not exaggerating a bit in this."



Operating levers of the new Lea-Francis three-speed gear.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

A Silent Machine.

Sir,—In your excellent journal I take delight. Never do I every Thursday fail to purchase one copy, and I think Mr. Davies, in his recent article, hit the nail on the head in many things. To me it seems there have been improve- in one regard there is much to be said. I mean that I wish for an engine quite silent, if possible. In this so beautiful country where I ride, in May and June the birds sing divinely, and all of Nature is one big heavenly choir; but always I have to stop the machine to listen. To go so noisily—bang, bang, pop, pop—through scenes so entrancing, it is not nice—it is desecrating. Often have I wished for an electric cycle, and my little friend I do not think it is more noisy at all than those whom I meet. I hope some day to find an engine more silent. LOUIS HALCET.

Sir,—I have read in *The Motor Cycle* the excellent letter to the trade, written by Mr. B. H. Davies, but I notice that the writer has missed out something of great importance, and something which I, as a rider of a motor cycle, have long wished for—a silent machine.

I am sure that I am not the only motor cyclist who pictures in his mind a powerful yet quiet engine. The village in which I live is a quiet place (or rather it was until I bought my motor bicycle), and if I am out late at night suddenly the villagers are awakened by what sounds like a 60 h.p. aeroplane descending in the middle of the village. But no—it is only me attempting to sneak quietly home on my fussy little lightweight L.W.L.

Removing Flywheels.

Sir,—In your issue of November 26th I saw a request from "H.A.C." for a tip for removing the flywheel of a Douglas motor cycle. This is a very simple matter for two people. First remove the nut, then let the operator take a *heavy* hammer in his right hand and with his left hand pull the edge of the flywheel towards himself, getting his friend to pull the other side of the flywheel in the same direction, *i.e.*, as though they were both trying to pull the flywheel off the crankshaft; with his free hand his friend must steady the machine. The operator must then hit the end of the crankshaft with a blow that may best be described as a steady pushing bump; the flywheel should come off immediately, and the machine tend to topple over away from the operator.

The points to notice are, as the end of the shaft is rounded, if the blow is hit perfectly square and the hammer used is of the right weight (I personally use the back of an axe with the head about 3 lb. weight), no damage can be done to the crankshaft; if a light hammer is used the end of the crankshaft will be riveted up, but if a hammer of the proper weight is used it will push the crankshaft right out of the flywheel, and, of course, it is obvious that the hammer must be heavy enough to shift the whole machine a little. The operator will be surprised how light a blow is really necessary, provided the blow is of the right character and delivered perfectly square against the pressure of the two hands tending to pull the flywheel off.

H. P. FISHER.

What are Ideal Handle-bars?

Sir,—I note with interest the discussion on the above question in your columns. Unfortunately, I think a good deal of misunderstanding exists on this point. The rider who adopts a pair of handle-bars in any way resembling T.T. pattern is at once put down by bigoted people as a dangerous person whose sole object is to dash blindly and wildly round corners, to the danger of himself and everybody else, with the desire to be taken for a Brooklands crack! That this may be the fact in certain cases is no reason why the type of bars should be condemned, but rather the rider. I have personally progressed from the type of bars that almost poke into the middle of one's anatomy, through various shapes, to a pair of short bars having a width of 28in. and a fairly forward position, and I can emphatically say they are much more comfortable and give a greater feeling of security than any I have had previously.

For ordinary touring work I should favour a pair of bars about 28in. wide, with grips about the height of the top of the saddle, and fairly short in length; but this latter point depends entirely on the design of frame of machine and the stature of the rider. It is of interest to note that, year by year, the standard touring bars as fitted by makers are getting shorter and wider. With a forward position and using rear footrests, on a long ride the freedom from backache is most marked. One never hears of a rider with T.T. or semi-T.T bars clamouring for a back rest, as he never feels the need for one. Without doubt, the wide bars tend to a feeling of much better control and consequent security. On some machines where handle-bar vibration is much felt this may be considerably reduced by the use of ⅞in. diameter bars.

I think that "Sure and Steady" is taking a somewhat narrow-minded view of the question, his opinion appearing to be largely founded on prejudice. It is not improbable that the reckless speed-burst maniac—much as we regret him—with T.T. bars is safer in an emergency at forty miles an hour than the man with long, narrow bars at twenty-five miles an hour.

The same prejudice exists in the case of the "racing helmet," so called! This type of headgear is neat, extremely comfortable, warm, and, above all, keeps the head clean from dust and dirt, and yet, for some reason or other, it is supposed to savour of excessive speed, and is thus banned! W.M.

Why an Engine Konks.

Sir,—I have noted with much interest the resurrection of this question. Konking, I feel sure, is caused by a loose piston only. This is very easily proved, and is not the difficult or abstruse problem which some people imagine. With a motor cycle engine which has a loose piston, on half throttle a tapping is heard, and as the throttle is opened on a hill, so that the full load comes on the engine, it will be heard that this tap *gradually changes* into a konk or "pink," or whatever one wishes to term it. It is so easy to hear the *gradual* change from the knock to the konk that there can be no mistake about it, and, moreover, if very thick oil is used and plenty of it, and while the engine is cold, there will be no konk; but the moment the oil has been reduced to the consistency of paraffin from heat, konking begins, as the surface between the piston and the cylinder is then to a certain extent unlubricated.

The water knock, which one of your contributors mentions, has nothing to do with the subject, water being incompressible, and cannot be compared with the action of gas. The big end or the small end also has no bearing on the konk: it is simply a matter of the piston and the cylinder, and if a piston is made sufficiently tight, really too tight for hard work, it will be impossible to make it konk.

A simple proof is to take a twin with one piston a loose fit, the other one tight; it will then be only possible to make one cylinder konk, which I think should prove beyond all doubt as to the cause, and this is the test that I have made. OSBORNE DE LISSA.

Sir,—I should like to be allowed to criticise the article which appeared in *The Motor Cycle* on November 5th.

In the first place, as you point out in an editorial on the subject, the writer's arguments largely lose weight because the vast majority of motor cycle engines have the valves at the side and not back or front. Consequently, angularity of the connecting rod would not put all the piston clearance on the side opposite the sparking plug.

But, apart from this, it is surely a rather far-fetched idea to think that the rise in pressure emanating from one side of the combustion chamber can put any side thrust on the piston! We learn that "action and reaction are equal and opposite": consequently, wherever the high pressure gases come in contact with the restraining walls there is an equal and opposite restraining force, and the direction of this force is perpendicular to the surface under consideration. So I maintain that, no matter where the plug is, the direction of the pressure on the piston is perpendicular to the surface exposed to it. If the piston over-ran the port there certainly would be a side thrust set up, but this is never the case in a properly designed petrol engine.

Again, he says, "if the piston is too high up in the cylinder when the gas is fired, either through the ignition being too far advanced or pre-ignition," etc. Now, surely, if the ignition were too far advanced the piston would be too *low* in the cylinder?

I am quite open to admit that too much piston clearance gives rise to a noise—known as "piston tap"—and that this is due to the piston being rocked by the angularity of the connecting rod. But the explosion has nothing to do with it, except in so far as it causes the connecting rod to push the piston against the opposite cylinder wall. Yet this is not a "konk." Indeed, one can rarely hear it except on an otherwise quiet engine. Also, I do not see that this theory accounts for a dirty engine's greater liability to make the noise. The word "pre-ignition" is, I think, very much abused. It surely is intended to apply to ignition which is spontaneous and takes place before the spark occurs. If this is the sole cause of konking, why does retarding the spark stop it at once?

I think the writer is on the wrong track altogether. I have known an engine konk violently when hot, and yet the piston was as tight as it dare be fitted. My theory of konking is that it is due to the suddenness of the rise of pressure. The cylinder walls, even when clean, and even in a water-cooled engine, may be at a dull red heat, just skin deep, when konking starts, and the combustion, once started by the plug, is so assisted by these hot walls, that it ceases to be a "combustion" and becomes a "detonation." Then, the spark being advanced, means that the piston is still rising when this occurs, and "meets" the detonation, causing the konk. Retarding the spark mitigates it because the piston is then running away from the source of pressure. Also closing the air lever stops the noise because the enriched charge burns more slowly and the detonating effect ceases.

Also, in my opinion, pocketed plugs help konking, because then the combustion is started by a spurt of flame from the pocket into the main charge, causing detonation.

There has been a good deal of correspondence in the motor papers lately about the Knight engine's freedom from "pinking." This may be partly due to the hemispherical shape of the combustion chambers; but, in my opinion, it is to be attributed chiefly to a low compression ratio, and also to leakage past the sleeves lowering the compression still further.

NORMAN H. WALKER.

Sir,—I should like, if I may, to offer a few points of criticism on the interesting article by your contributor, Mr. C. Watchorn, in your issue of the 5th inst. Opinions as to the exact cause of the phenomena differ widely, and your correspondent's boldness in asserting that it is due to the abnormal pressure produced in the cylinder by pre-ignition, causing the piston to rock to the extent of the clearance space between it and the cylinder, is commendable.

Small two-stroke marine engines, known as outboard motors, are designed to reverse by over-advancing the point of ignition, this causing them to fire early, kick back, and continue to run in the opposite direction of rotation. These engines invariably give one severe konk when the spark occurs just before the end of the compression stroke on which they reverse. Now, this konk cannot be due to the piston moving across the cylinder, as the crank pin during the time of firing back has not passed the dead centre, or, in other words, the connecting rod has not reversed its angularity, and, consequently, the piston is still pressed against the same side of the cylinder wall. This is illustrated by the diagram fig. 1.

It will, however, perhaps be of interest to see what effect an increase of pressure, which it is agreed accompanies pre-ignition, has on the reaction of the piston against the cylinder wall. For this purpose let us take the case of a cylinder 85 mm. bore and a normal maximum explosion pressure of 200 lb. per square inch, which is a fair average (maximum). We will also assume a maximum pressure caused by pre-ignition, stated by your contributor to be 300 lb. per square inch.

Now, the angle of the connecting rod at which the piston changes over from fig. 1 to fig. 2 we will take as 5°. The value of this angle is probably an excessive figure, but this will over rather than under estimate our difference in piston pressure on the cylinder wall. Taking the area of the piston, 85 mm. = 8.79 square inches, which, multiplied by a normal maximum explosion pressure of 200 lb. per square inch = 1,758 lb. pressure acting vertically downwards on the piston as in fig. 2. With a pre-ignition, or abnormal pressure, of 300 lb. per square inch, the total downward pressure on the piston will be 8.79 square inches multiplied by 300 = 2,637 lb., as also shown in fig. 2. The angle of the connecting rod being

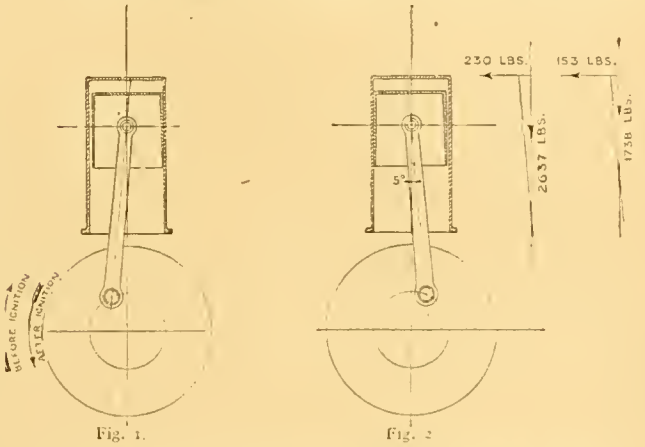


Fig. 1. Fig. 2.

Fig. 1.—Illustrates the positions of the connecting rod and piston when reversing a two-stroke engine by intentional pre-ignition, this being also the position in which the engine konks.

Fig. 2.—Shows the increase of the pressure of the piston against the cylinder wall caused by an increase of explosion pressure due to pre-ignition.

5°, then the resultant pressure on the cylinder wall with the normal explosion will be tan 5° × 1,758 = 153 lb., acting outwardly on the cylinder wall. With the abnormal pre-ignition pressure the resultant pressure on the cylinder wall will be tan 5° × 2,637 = 230 lb. Now, the question arises, is the extra 77 lb. acting through the distance of the piston clearance (usually about four thousandths of an inch, but varying with different engines) sufficient to account for the familiar violent konking when a normal pressure of 153 lb. causes no appreciable noise at all? I think not. To sum up.

(1.) Konking does not appear to take place after the piston has reached the end of the stroke, and, therefore, cannot be due to the piston crossing over the cylinder.

(2.) An engine will konk or pink with a piston rigidly fixed (transversely) as in some types of large gas engines.

(3.) Konking occurs in reversing a small two-stroke engine by pre-ignition when the piston does not reach the end of the stroke.

(4.) Pre-ignition does not appear to increase the pressure on the cylinder wall sufficiently over the normal to account for the noise of konking.

Of course, these notes are not intended to give a settlement to the problem, and are open to criticism, but they are penned in the hope that they may give interesting points for thought on what is undoubtedly an interesting subject.

HORACE H. SMITH.

[Lack of space has compelled us to cut out certain portions of this letter, but the points deleted have been already dealt with by other correspondents.—ED.]

Sir,—In reading through Mr. Watchorn's article on "Why an Engine Konks" (November 5th, 1914), probably the explanation which he gives may seem very good, but it would be just as well to go rather further into the matter.

Taking figs. 1 and 2, the direction of rotation of the engine and position of the valve pockets, and consequently the sparking plug, are quite right for the average 20 h.p. car engine, and in such a case no doubt some slight amount of noise *may* be caused as described. In the average air-cooled motor cycle engine, however, the relative position is different, and the thrust of the connecting rod does not help to throw the piston over in the same direction as it would be thrown by the explosive force. From this point it could be argued that a motor cycle engine should not konk or pink as soon as a car engine, which is hardly the exact case, I am afraid

Further, following this line of argument, if the sparking plug is moved to the centre of the cylinder in either the T or F-headed type the konking should be diminished, but from some trials made in 1906 with an 80×90 mm. four-cylinder White and Poppe engine no difference could be found in this respect.

Taking the matter still further, and considering an engine with valves and plug on the opposite side to that shown in figs. 1 and 2 (page 503), then the explosive force, if it has any action at all on the movement of the piston, would tend to reduce the konking, as it would act against the side thrust of the connecting rod and bring about better conditions than those given for the cylinder with hemispherical head.

I am afraid that, in view of the conclusion to which Mr. Watchorn's argument has now been brought, it will hardly satisfy one who really wishes to know what causes the konking. A favourite question among motorists a few years ago was, When an engine knocks, what knocks? Up to the present I have never heard a really satisfactory answer.

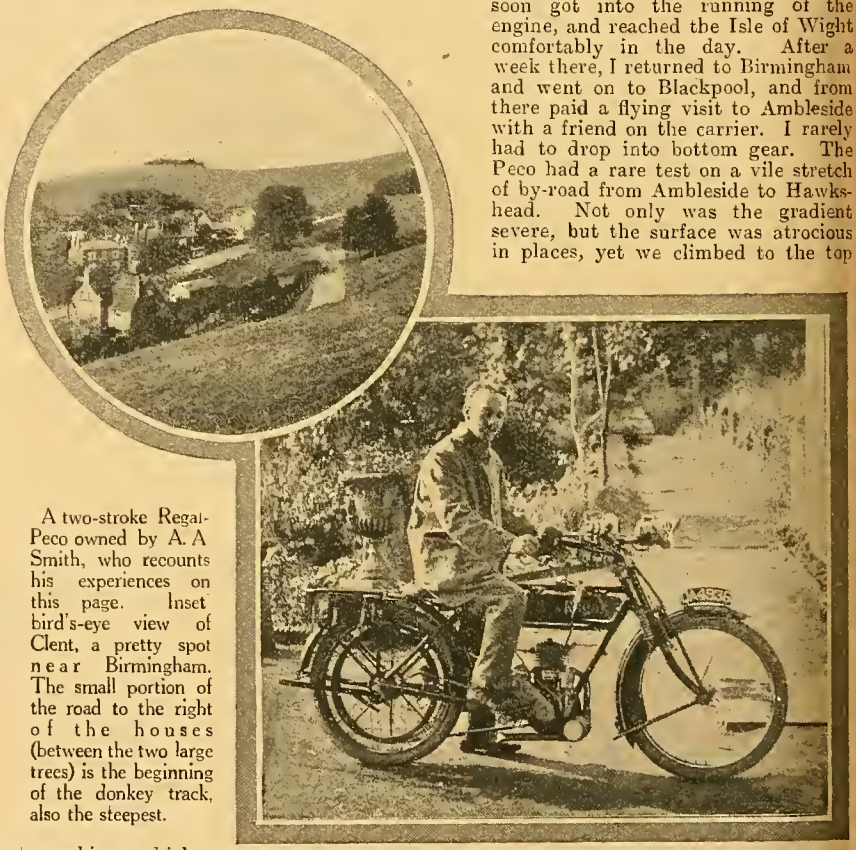
J. MILNE, JUN.

Running Costs.

Sir,—In *The Motor Cycle* of 22nd October I observed a letter giving a rider's experience of the cost of running a Douglas motor cycle over a distance of 5,400 miles. As I have used a Douglas 2¾ h.p almost since the introduction of this machine I found the letter very interesting, but my experience as to running expenses does not coincide with that of your correspondent. Perhaps the fact that I am Scotch accounts for some part of the economy; but, probably, my knowledge of the Douglas machine is a more potent factor than nationality. Let me give you my experience of my present machine, which I obtained in June, 1912.

In 1912 I covered 1,500 miles, in 1913 2,500 miles, this year 1,200 miles, making an aggregate of 5,200 miles. I also use a car, which keeps down my mileage with the motor cycle. Petrol works out at almost exactly 100 miles to the gallon. It has cost me £4 for the distance traversed. Of lubricant I have used four gallons, costing 8s. (*i.e.*, 2s. per gallon). After 4,000 miles the chain to counter-shaft broke, and a new chain cost 3s. 6d. After 1,000 miles the back tyre sustained a severe cut. I obtained a new Hutchinson cover at a cost of 25s. and vulcanised the cut one. The Hutchinson cover is still going strong, and I have the repaired cover in reserve. I am still using the original belt, but it is getting a bit decadent now, and I always carry a spare when I go off on a long journey. Renewals consist of a fork spring, 1s., and a hub bearing cone, 1s. I had a fall and smashed a footboard; renewal cost 4s. Altogether, my expenses, exclusive of licences, have been: Petrol, £4; lubricant, 8s.; cover, £1 5s.; chain, 3s. 6d.; renewals, 6s.; total, £6 2s. 6d.; which, divided by 5,200, works out at .28 of a penny, or something over a farthing per mile. Of course, if one adds licences and depreciation, the cost goes up materially, but the above is my actual outlay on locomotion. I found that by keeping down to about 25 m.p.h. I lessened the petrol bill materially; but the main economy lies in the fact that I look after the machine myself and that, though I use, I do not abuse it. I have been sufficiently long at the job to know something of what metal and other materials will stand, and, to save myself trouble and expense, I handle the machine, as far as possible, as if it were a living thing and had feelings. The machine is still practically as good as new, and, indeed, it should be after such a small mileage as 5,200.

GEORGE A. MACKAY.



A two-stroke Regal-Peco owned by A. A Smith, who recounts his experiences on this page. Inset bird's-eye view of Clent, a pretty spot near Birmingham. The small portion of the road to the right of the houses (between the two large trees) is the beginning of the donkey track, also the steepest.

A Powerful Two-stroke.

Sir,—Several motorists lately have been writing on the "Power of Two-strokes," and their remarks have been interesting reading.

I invested in a Regal-Peco only two days before my holiday in July, and wondered how I should fare, but I soon got into the running of the engine, and reached the Isle of Wight comfortably in the day. After a week there, I returned to Birmingham and went on to Blackpool, and from there paid a flying visit to Ambleside with a friend on the carrier. I rarely had to drop into bottom gear. The Peco had a rare test on a vile stretch of by-road from Ambleside to Hawkshead. Not only was the gradient severe, but the surface was atrocious in places, yet we climbed to the top without a hitch, the engine showing no sign of overheating. I covered 800 miles in my fortnight—not bad for a novice.

Three months ago I purchased a sidecar cheap, but it is not a light one. On this I have brought four (three adults and a boy of eleven) up Mucklow Hill, Halesowen. I dropped into bottom gear (about 12 to 1) for this climb, and the roaring burr r-r of the engine was good to hear. The load would be at least 35 stone. I have also climbed Weatheroak Hill with a 10 stone passenger, and this hill is steeper than Mucklow.

Reading a little while ago of an A.J.S. rider climbing solo the donkey track up Clent Hills on his 2¾ h.p., I decided to have a go with the sidecar and passenger; and although the donkey road was greasy, owing to rain, we got up on bottom gear, despite the wheels slipping a good deal.

Of course, when out solo, it is only rarely I have to drop into middle gear. Mucklow Hill, for instance, I climb easily on top.

A. A. SMITH.

8 Second-hand Machines At Greatly Reduced Prices

Here you have a wide choice for the selection of your next machine, and an excellent opportunity to economise on price. You can purchase any one of these reliable machines—one-fifth of the price as deposit, and the balance in 12 monthly instalments.

ON THE BALANCE ONLY we charge 2½ %

1914 2¼ h.p. Calthorpe Jnr., 2-speed, only run 100 miles **£22 10**

1913 3½ h.p. T.T. Rudge, just overhauled by makers **£27 10**

1914 3¾ h.p. Scott, used for demonstration purposes; only run about 600 miles..... **£63**

1914 8 h.p. Martin-Jap, 3-speed, run 2,000 miles. Complete with lamp and generator, horn, speedometer. **£45**

1913 3½ h.p. 3-speed New Hudson Combination, with coach-built Montgomery sidecar **£55**

1914 6 h.p. 2-speed Matchless Combination, Chain Drive, fitted with Matchless cane sidecar **£60**

1914 2½ h.p. 2-speed single-cyl. F.N.; slightly store-soiled, never been on the road. Usual price, £49 To clear..... **£45**

1914 7 h.p. 3-speed four-cyl. F.N; slightly store-soiled, never been on the road, would make excellent sidecar machine. Usual price, £78 To clear..... **£73**

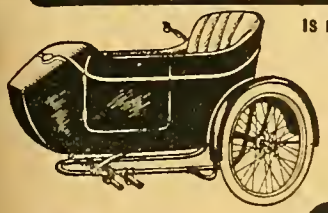
WORLD WIDE POPULARITY

IS BEING ATTAINED BY THE FAMOUS



Canoelet SIDECAR

OVERSEAS RIDERS SHOULD WRITE TO-DAY FOR OUR ART BOOK THAT TELLS ALL ABOUT IT.

The Sidecar of exceptionally perfect design and patented construction, which gives the most satisfactory results on the roughest roads and under the severest riding conditions met with overseas.

THE COACH-BUILT SIDECAR UNEQUALLED FOR SMART APPEARANCE, LUXURIOUS SEATING, SAFE LOW TRAVELLING POSITION, PATENT UNBREAKABLE CHASSIS, PERFECT VIBRATIONLESS SUSPENSION AND SPRINGING.

PRICES £10 10 0 to £16 16 0

OF DEALERS THROUGHOUT THE WORLD, OR DIRECT FROM

MEAD & DEAKIN, RUSHEY LANE, TYSELEY, BIRMINGHAM, ENG.

MILLENNIUM TOOLS

SAVE TIME AND EXPENSE.

'MILLENNIUM' UNIVERSAL VALVE TRUER.

For truing seatings on the heads of motor valves. Does the work as well as a lathe, and in less time. PRICE 7/6

'MILLENNIUM' PARALLEL VALVE SPRING LIFTER.

Does not bend the valve stem. Easy to use. Made of best steel stampings. PRICE 4/9

'MILLENNIUM' MAGNETO TIMING WHEEL PULLER.

For keeping the engine properly timed. This tool is exceedingly handy to use and can be worked in very confined spaces. PRICE 5/6

'MILLENNIUM' MOTOR CYCLE PULLEY DRAWER.

Enables the pulleys of Motor Bicycles to be removed without damaging the motors. Fits practically all pulleys from 3/6 in. diameter. PRICE 8/-

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.J.S.

A.J.S. Twin, 2-speed gear, coachbuilt sidecar; 40 gns. —Chilton, High St., Watford. [X4300

A.J.S., 2¾h.p., 1912, 2 speeds, just overhauled, new Dunlop tyre on back; £28.—Andrews, 9, Broad St., Ludlow. [X4156

5h.p. A.J.S. Combination, lamp, horn, screen, etc., fine condition; £43, no offers.—Gill, 11, Westcroft Sq., Hammersmith. [9247

2¾h.p. A.J.S., new July, splendid condition, new tyres; nearest £40 secures.—Fairweather, 5, Brunswick Terrace, Perth. [X4187

2½h.p. A.J.S., 2-speed gear box, clutch, kick starter, lamp, horn, accessories, good condition, climb anything; 16 gns.—Neaum, Fordingbridge. [X4298

1914 A.J.S. Combination, detachable wheels, Lucas 24/- horn, spare chains, etc., perfect condition; 70 gns.—152, North Rd., St. Helen's. [9344

1914 A.J.S., 6h.p., and sidecar, with hood, screen, detachable wheels, etc.; original price £94/17/6 shop-soiled, reduced to 80 gns.—Julian, Broad St., Reading. 43 years' reputation. [X3723

A.J.S., 1915 Models.—2¾h.p., 47 gns.; 4h.p. twin, new model, 64 gns.; 6h.p., 72 gns.; all complete, with detachable wheels; immediate delivery; exchanges considered.—The Great A.J.S. Specialists, Walsall Garage, Wolverhampton St., Walsall. [X2962

All the best 1915 Models under the Colmore roof.

AS becomes an Agency reputed for service, we have secured the first standard 1915 models of the acknowledged best makes, those we know the real worth of. We invite all who are interested in the very latest construction to our depots in Birmingham, Leicester, Liverpool, and Manchester, to see the ingenious improvements, borne of another year's experience, which will enhance the pleasure of motoring, and further secure the dependability and service of the machines. Among the 1915 machines we have to show you are:

The Levis. The featherweight. The original two-stroke, and still the best. Reliable to a degree—gifted with a remarkable reserve of power, and so flexible.

The Douglas. The pre-eminent lightweight. We are all acquainted with the well-deserved fame of the Douglas.

The Triumph. That the Triumph is the Triumph is sufficient for most of us. We are daily expecting the first standard models of the 3¼-4 h.p. new counter-shaft machine.

The Matchless. The big generous twin. It gets hold of its job with determination, and makes light of sidecar work. The latent power in this big generous twin is a source of delight and confidence to its driver.

The Morgan. The little car that popularised run-abouts. You know the racy little things—low built, speedy. Cost no more than a sidecar outfit either to buy or run. We have three beautiful 1915 models ready for sale: The "Sporting," Grand Prix, and De Luxe.

At the Colmore Depots you will find the newest models of the best machines and equipment. And at the Colmore Depots you will enjoy the most expert and helpful service most willingly tendered.

BARGAINS IN 1914 MACHINES

for 25% less than list price. All late season's deliveries; splendid machines; itching for riders and the open road. Real bargains.

SECOND-HANDS.—We have a few really good ones to sell. Overhauled and tuned up by our own mechanics. Exceptionally cheap lines.

Colmore Depots

For genuine motor service.

BIRMINGHAM - 31, Colmore Row.
LEICESTER - 62, High Street.
LIVERPOOL - 31, Renshaw St.
MANCHESTER - 261, Deansgate.

MOTOR CYCLES FOR SALE.

Alldays.

ALLDAYS, 2½h.p., 2-stroke, August, 1914, equal to new; owner enlisted; £20.—Cook, 35, The Broadway, Crouch End. [9319

American Excelsior.

1914 Excelsior (American), 7h.p., clutch, special racing model, only used 200 miles, very fast; £48.—Harris, 10, Gt. Chapel St., Oxford St., W. [9395

Ariel.

ARIEL 3½h.p. Countershaft Combination, 1914 lamps, horn, speedometer, and spares; cost £86/10 accept £70; only run 2,585 miles, 3 months old.—Baker Salisbury Rd., Shaftesbury. [9217

Auto-Wheels.

AUTO-WHEEL and Hercules cycle, new September used once; £17.—36, King David Lane, Shadwell E. [9301

THREE Auto-wheels, second-hand, for sale; prices from £10 each.—Taylor, The Garage, Westerham. [9312

AUTO-WHEEL, in splendid condition, been very little used; £10, bargain.—Buckingham, Tindal St., Chelmsford. [9291

1914 Auto-Wheel, perfect condition, guarantee holds good until May, 1915; £10/10.—Walton, Elmet Av., Roundhay, Leeds. [X4179

AUTO-WHEELS, 1915 models, now ready; immediate delivery; £14/14 and £15/15. Trade supplied.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [8851

Bat.

4h.p. Bat, 2 speeds, Bosch, reliable; £11; must sell.—4, Cedar Rd., Tottenham. [9263

BAT-J.A.P., 1910, 8h.p., a.o.i.v., sidecar, good condition; £20.—Hawley, 28, West St., Leicester. [X3896

BAT, 1914, 4½h.p., 2-speed, No. 1 model; catalogue price £57/10, brand new, cash price £47/10.—Layton's, Bicester, Oxon. [X4217

BAT, 1912, 3½h.p., spring frame, in very good condition; £22.—The Exeter Motor Cycle and Light Car Co., Ltd., 7, Bath Rd., Exeter, and 28, Tavistock Rd., Plymouth. [0603

1913 8h.p. Bat and Racing Sidecar, with overhead valves, just overhauled, in perfect condition; 38 gns., great bargain.—Julian, Broad St., Reading. 43 years' reputation. [X3722

Bradbury.

1913 (June) Bradbury, 4h.p., 2-speed, perfect condition C.B. sidecar, lamps, etc.; £40.—Pollitt, Greenholme, Worsley. [X3900

BRADBURY, 4h.p., 1912, and sidecar, 2 speeds, free engine, all on; £35.—Hansford, 41, St. Stephen's Terrace, South Lambeth, S.W. [X4119

BRADBURY, 3½h.p., 1911 model, 1913, 3-speed gear, 26×2¼ plated rims, B. and B. carburetter, excellent order, all accessories, £23/10; coachbuilt nearly new sidecar, £5/5, bargain.—Club, 17, The Square, Bedford St., Commercial Rd., E. [X4276

BRADBURY, late 1913, 4h.p., 3-speed Sturmey gear and clutch, Turner coachbuilt sidecar, wind screen, head lamps, tail and sidecar lamps, splendid order; genuine bargain, £39/10.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0598

BRADBURY, 1912-13, standard 4h.p., handsome machine, appearance and condition as new, new belt and tyres, lamp, horn, tools, etc., free engine clutch, variable pulley; a real nice lot, and very cheap, £24, or lightweight and cash.—136, Dalmally Rd., Croydon. [9281

Brough.

BROUGH, marvellous motor cycle, nothing else like it.—Tweedale Armstead Motors, Ltd., Magdalen St., Oxford. [0581

Brown.

2½h.p. Brown-Precision, 1912, good condition; £16.—Browne, 90, Park St., London, N.W. [9259

BROWN, 1912, 2½h.p., variable gear and free engine, in splendid condition; £17, great bargain.—Howes, 2, Prospect St., Caversham, Reading. [9233

B.S.A.

B.S.A., 1912, 2-speed, lamp, horn, spares, tools, good condition throughout; £27/10.—Below.

B.S.A., 1912, free engine, complete as above, £22/10; sidecar to fit either machine, torpedo front, side door, £3/5; approval.—Young and Herbert, Evesham. [X4225

B.S.A., 1915, 4¼h.p., model K, for immediate delivery —B.S.A. Agents, The Morris Garages, Oxford. [8746

B.S.A., 1915, 4¼h.p., model H, for immediate delivery £63; exchanges.—Maude's, 136, Gt. Portland St., London, W. [0628

1914 T.T B.S.A., special racing engine, handle-bars, 4 gn. Watford, horn; £40.—Holden, Kenmare, Burnley. [9308

MOTOR CYCLES FOR SALE.

Kerry.

3½h.p. Kerry, 1912, 2-speed, good sidecar machine; bargain, £26.—The Exeter Motor Cycle and Light Car Co., 7, Bath Rd., Exeter, and 28, Tavistock Rd., Plymouth. [0605

King.

3½h.p. King, coachbuilt sidecar, Bosch mag., B. and B., good condition; bargain, 13 gns.—45, Westbury Rd., Forest Gate. [X4222

Lea-Francis.

LEA-FRANCIS, 1915, the aristocrat of motor cycles; early delivery; easy payments; second-hand machines in part.—London agents, Sproston and Grace, 154, Gt. Titchfield St., W. Regent 4999 [0448

Levis.

LEVIS Popular Models in stock at £25; excellent value.—Lamb's, 151, High St., Walthamstow. [9336

LEVIS.—Harry Walker's official agency. Note new address: 734, Holloway Rd., N. Prompt supplies; smart repairs. [9326

Lincoln Elk.

LINCOLN-ELK, 1913, 4¼h.p., 2-speed, kick start, Comfy sidecar; £35, offers.—Box L6,542, *The Motor Cycle* Offices, 20, Tudor St., E.C. [9385

L.M.C.

L.M.C., 3½h.p., 2-speed gear, free engine, kick starter; 18 gns.—Chilton, High St., Watford. [X4301

Matchless.

HIAWATHA

(With abject apologies to Longfellow).

Should you ask me, whence the Indian
Whence the motocycle marvel
With the power of a Niagara
lying waiting in the engine
answering, with throttle opened,
with a thousand revolutions
as of thunder in the mountains —
leaving everything behind it
passing everything in motion —

Yet controlled to sigh and whisper
like the summer breeze in forest
thro' the pilot jet of metal
leading from the Carburetter
drifting gently with the traffic
resting — when the Arm uplifted
marks a passage for the walker —
we should answer, we should tell you
From the Famous Factory Hendee.

If still further you should ask us
What about the latest models
What about the Nineteen Fifteen
can you execute our orders
We should answer your enquiries
Straightway in such words as follows :

No description in cold print can adequately describe the wonderful Indian Motor Cycle. It has maintained the lead each year — but the new models surpass anything yet achieved by the Hendee Co. Godfreys will send you full particulars, illustrated, free by return of post, but in your own interest DON'T DECIDE on your new mount until you have investigated the merits of the new Indians.

Model B, 5 h.p.,

Twin-cylinder 3-speed,

£60.

Sidecars for Despatch Riders.

OBSERVANT readers will have noticed, when perusing the various experiences related by despatch riders at the Front, that the road conditions are often almost indescribable. One can comprehend, to some extent, the state of the roads when the weather is considered, and also the fact that many times daily strings of heavy motor lorries pass over the same ground. It is not merely mud that causes the trouble, but the whole width of the road being churned up into a surface resembling a ploughed field, and pits made by shells are numerous. Again, the duties of the unbiquitous rider frequently take him along by-paths and side tracks off the road, and when these have become rain-sodden and churned up by dint of the amount of traffic passing over them, it requires all the resources and skill of an experienced motor cyclist to keep his single-track machine upright. Here is an opportunity for the uses of the motor cycle to be extended by adopting sidecars for despatch carrying. We have seen it suggested from time to time that during this bad weather the movements of the motor bicyclist are governed to some extent by the state of the road; but it would appear that no one in authority has considered the possibility of using the motor bicycle and sidecar for the work of despatch riders.

In view of the success of motor cycles, the expedient of attaching a sidecar would commend itself to one immediately. We are at the moment referring to the sidecar attachment as a means of rendering the motor bicycle absolutely stable under all conditions, but the fact that it will also convey two people is a point in its favour which cannot be overlooked. The motor bicycle has received praise on all hands for its splendid work. The up-to-date sidecar is no less reliable. It certainly requires more room on the road—a most important consideration in warfare—but, nevertheless, it requires considerably less room than a small car. The speed of a good sidecar outfit over muddy surfaces would be at least as great as that of a motor bicycle. It consumes very little extra petrol, and, considering the subject from all its aspects, the sidecar undoubtedly makes a strong claim on the Government in the exceptionally severe winter campaign of the despatch rider. We wonder if makers have approached the Government on the subject. Such a proposal would, we feel sure, commend itself to the consideration of the War Office experts, who know only too well that every type of motor vehicle has its limitations. The addition of a sidecar does not affect the valuable qualities of a motor bicycle to any appreciable extent, and the fact that sidecars are now being largely used for the conveyance of quick-firing guns is proof that the authorities are well aware of their reliability and general excellence. Already we are well into the winter campaign, and rain-soaked roads will be the rule for some time to come, so that prompt action is necessary.

The Indispensable Motor Cycle.

ALL motor cyclists and motorists will regard with pride the excellent doings of the motor cyclist despatch riders on active service at the Front. On all hands they are receiving official recognition of their valuable services rendered under arduous conditions. From the first, the names of motor cyclists have been mentioned in despatches, and since that time other riders have been specially honoured and decorated for special service both by His Majesty's Government and by the French authorities.

That motor cyclists are able to perform such useful work must be a particular pleasure to every patriotic Britisher, seeing that more motor cyclists are employed in our Army than in any other, and, moreover, that the British-made motor cycle which has rendered such difficult work possible is second to none in the world.

Thick and Thin Electrodes.

The correspondence elicited by my paragraph of November 26th has brought out one new point. A Scott rider asserts that very cheap and shoddy plugs, fitted with flimsy electrodes, stand up better in his engine than first class plugs with solid single-point electrodes. He believes that the single-point plugs keep too cool in "wet" engines, with the result that oil thrown on the plugs is not immediately burnt off, but slowly charred into a short-circuiting bridge; on the other hand, a plug with several comparatively spidery electrodes gets so hot that the oil deposits are burnt up as soon as they touch the points. He suggests that the need of water-cooling on two-stroke engines exceeding 350 c.c. is intimately connected with this question, as follows:

1. Such engines oil their plugs freely.
2. A thick electrode plug soots up in any case, because it keeps too cool.
3. A thin electrode plug would cause pre-ignition if the engine were air-cooled.
4. Therefore a thin electrode plug in conjunction with water-cooling is the sole solution.

The argument is interesting, but other factors obviously enter into the matter.

Carbonisation.

The radical weakness of the hand pump system consists in the rapidity with which it carbonises an engine. The pumpful of oil, injected every five, ten, or fifteen miles, may certainly chill an over-stressed bush, but it also drowns the cylinder wall with excessive lubricant; a large percentage of this lubricant is flashed into carbon, and deposited on the piston head, in the piston ring grooves, around the valve heads, and on the head of the cylinder. Within 750 miles, as a rule, the presence of these deposits is perniciously felt, and at about 1,000 miles no fastidious owner can ride the machine further without removing the cylinder and scraping them away. Even if there were no practicable alternative, such swift carbonisation would be a genuine nuisance, and it is so regarded by the majority of motor cyclists—those mute people who never write to the papers, or join in our organised life, but who are nevertheless the base and backbone of the industry. But there are plenty of satisfactory alternatives. During this very season I have ridden an air-cooled twin-cylinder motor bicycle 4,000 miles without decarbonisation, and at the conclusion of that distance it was running really well. I have further covered 5,000 miles on a small four-cylinder cycle car without cleaning out the engine, and it is still pulling like a Trojan. It is unnecessary to say that neither of them had the crude hand pump oiling. The air-cooled cycle had a drip-feed oiler, combined with a bearing duct system; the light car had a mechanically driven pump, and a large crank case sump reserve. In both cases the engine bearings were devoid of perceptible wear after the distances named. Now that variable gears are thoroughly established, it is comparatively unimportant whether or not a motor cycle engine develops the last ounce of power which can be extracted from its engine dimensions, be they 350 c.c., 500 c.c., 750 c.c., or 1,000 c.c.; for the presence of a true emergency gear will more than compensate for the sacrifice of the sheer maximum of efficiency. But, in view of the number of buyers who loathe tinkering, it is tremendously important that an engine should run at least a full season without perceptible wear, and without calling for laborious and filthy attentions at short intervals.

A PRETTY SCENE ON THE HYTHE CANAL, KENT.

This canal was constructed by the military authorities about the time of the Peninsular War, and was used for bringing supplies of ammunition from Lydd to Shorncliffe Camp. It is now used for boating and fishing.

About Oil and Grease.

Men talk about the little things that make for comfort. I distribute my custom round the trade in rotation, and a month or two ago it fell to the fortune of the Vacuum Co. to receive my lubrication orders. With a five-gallon drum of T.T. they sent down a most excellent tap, ready fitted with a cutter reminiscent of Wills's cigarette tins; one twirl of the cutter and the drum was ready tapped. The grease for my cycle car was packed in a cartridge with a screw squeegee—just the thing for packing grease cups without waste. But alas! when the cartridge was half empty, there came a very cold morning, and the grease solidified in the canister. I turned on full finger power, and stripped a thread somewhere in the mechanism, so that the lift revolved idly. Nothing daunted, I got a hacksaw, and cut the bottom off the tin and the top off my thumb! The cartridges are excellent, but those containing hard grease would be better with a stronger fixture inside.

Metal Sidecar Bodies.

Has any reader noticed that sidecar bodies composed of unlined sheet metal panels are frightfully chilly in bad weather? I rashly concluded that a metal sidecar, being windproof, would keep its occupant deliciously warm in winter, and scrapped a well-lined wicker body in consequence. To my disgust, the metal body was far the colder of the two, presumably because the light panels were excellent conductors of cold, and soon fell to a temperature below freezing point under the impact of wind and sleet. I cannot claim a wide experience of modern types of sidecars, but, so far as my slight experience goes, wooden bodies are emphatically the warmest. Not long ago I was shown some multi-ply wood, used for constructing packing cases for Antarctic work; I should imagine some such material would be ideal for sidecars *de luxe*, combining the warmth of woodwork with the lightness of thin metal panels. What do the expert sidecar manufacturers say?

Small Bushes and Drip-oiling.

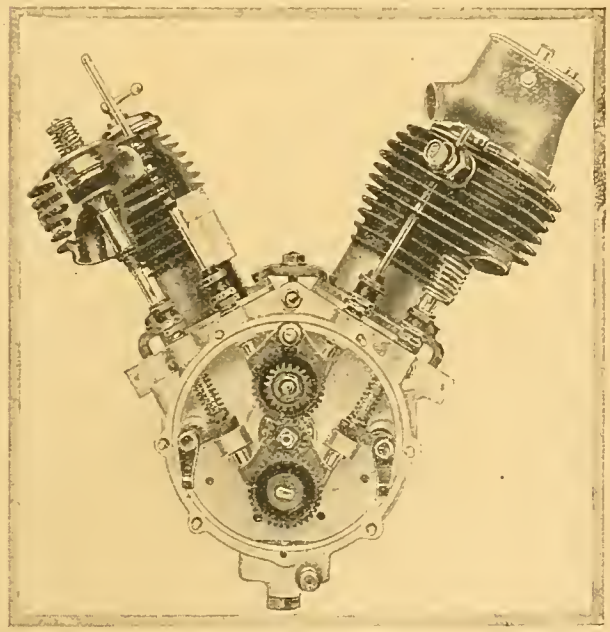
My recent comment on the above subject evidently touched several readers in a tender spot, and I have received a number of approving letters. I learn that at least one big firm has definitely instructed its customers to open the drip valve fully, and use the pump as if no drip were fitted. Super-efficient engines and long strokes have emphasised the trouble, and not a few users have used up two or three sets of connecting rod bearings within a single year. It would be a thousand pities if these unhappy experiences were allowed to create a prejudice against drip-feed oilers, which are probably intrinsically superior to the crude hand-pump systems. The fact is that our connecting rod bearings have always been on the small side, and dangerously near the limit of safety and durability. As soon as we deprive them of a lubrication system which practically acts as a periodic cold shower bath, their weakness is thrown into high relief. The moral is not that we should abandon drip oiling, but that we should redesign our bearings.

I Want to Know

What happens to second-hand machines in America? I received the usual exchanges of the principal American motor cycling journals, and it is quite the exception for an issue to contain more than a couple of dozen advertisements of last season's mounts. Perhaps the huge distances between townships render postal purchases somewhat dangerous, but, even then——! A friend of mine in the boot trade once told me there was no boot repairing trade in America, for, when a pair wanted resoling, the average man threw them away and bought a new pair. Perhaps they do the same with motor cycles. Just fancy finding a 1914 Hendee Special in a dust bin—yours for the carting home! I had previously thought of emigrating to South Africa where a friend of mine tells me he always *raffles* his last year's machine in the spring; last spring he got £84 in £1 tickets for a 1912 Triumph. But, pending reliable information from the States, I will stay in England till the German raid is over.

A Record?

I have just completed 1,000 miles on a new engine, which will ever occupy a niche of honour in my recollections because it has not oozed one single spot of oil from any joint; believe me or not, as you like, but nowhere on its exterior surfaces is there the least suggestion of a green film, though it has been smoking slightly from the exhaust over the entire distance. I am sorry to disappoint readers, but the engine is a four-cylinder water-cooled pattern on my latest cycle car. When I can say as much for an air-cooled cycle engine, I will not fail to record the fact. Up to date, I think a 1911 3½ h.p. Rudge ranks as the cleanest motor cycle engine I have ever had. Those designers who manage to perfect their crank case joints are generally routed by the valve tappets. But my last cycle car engine! Ye gods, it once sopped up 3½ gallons of oil on a 750 mile trip; and the cause, as usual, was leakage past the valve tappets. Let those who complain of leakage past one or two tappets figure what it means to have eight of them all spewing forth plenteous green fountains!



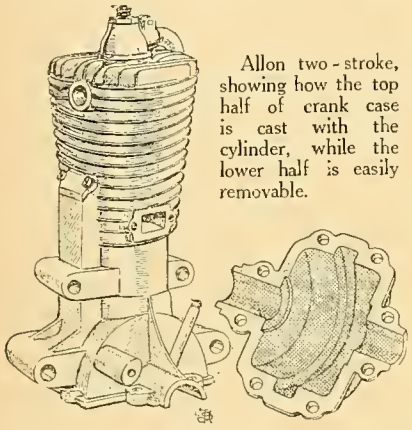
The 3 h.p. Enfield power unit, showing the simple timing gear exposed and the enclosed inlet valve mechanism. One cylinder is shown in section.

ALLON TWO-STROKE.

A LIGHTWEIGHT OF STRIKINGLY ORIGINAL DESIGN.

ONE of the most original designs of two-stroke lightweights we have yet inspected is the new Alldays, which, by the way, will be known as the Allon.

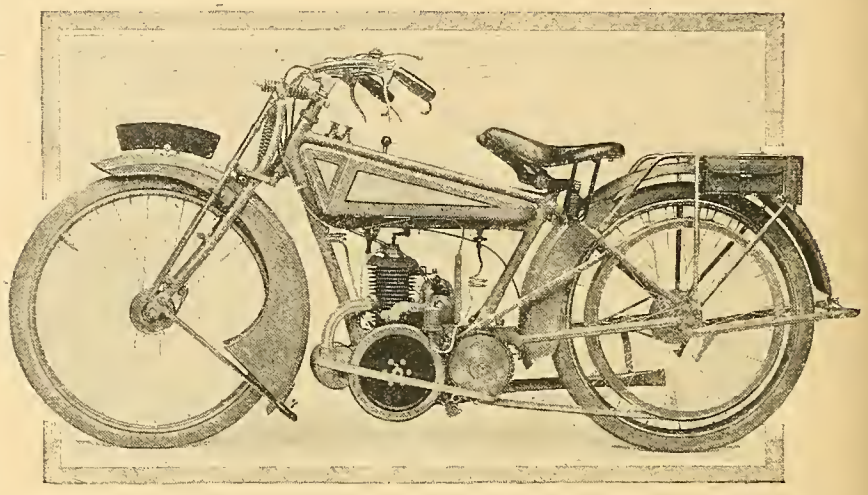
The frame construction is the first point that strikes the observer. It is excellently designed, and has a particularly good feature of straight tubes everywhere. Instead of the top dropped tube a sloping tube is employed, which gives it a distinctive appearance. It will be remembered that Messrs. Alldays and Onions were one of the first firms to adopt this type of frame, and the machine ridden by W. H. Longton (who by the way is now with the Colours) in the Isle of Man attracted considerable attention on this account.



Allon two-stroke, showing how the top half of crank case is cast with the cylinder, while the lower half is easily removable.

All the fittings are excellent everywhere, and stoutly carried out, a large and comfortable saddle being fitted, which, with Brampton forks and aluminium footboards, should render the machine extremely comfortable on the road.

The 26in. wheels are another important item. Both brakes are distinctly unusual, as on each hub is mounted a phosphor bronze drum, round which is wound a heavy spring steel wire. The wire is arranged so as to clear the drum comfortably when not in action, but to give a very powerful braking action when applied. The mudguards are fitted with deep side wings, and a combined chain and belt drive is employed.

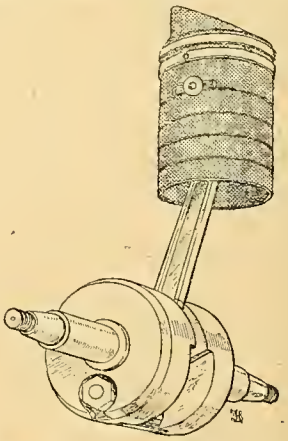


Left hand side of the 2¾ h.p. Allon two-stroke two-speeder.

Features of the Engine.

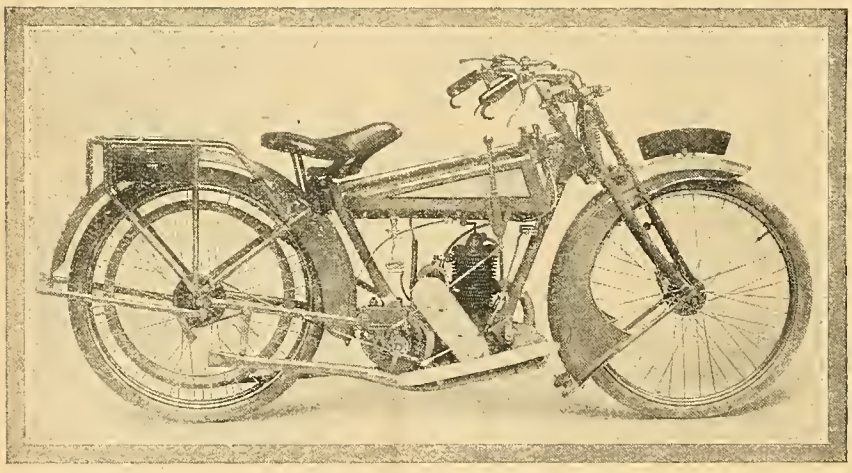
The 2¾ h.p. engine itself is striking in many respects. It has a bore and stroke of 70×76 mm. respectively, giving a capacity of 292 c.c. The cylinder is cast with the top half of the crank case, the crank case being split horizontally as in modern car engines; thus it is possible by simply removing the lower half of the crank case to drop out the crankshaft, connecting rod and piston, and cleaning is thereby rendered extremely easy. The transfer pipe is cast with the cylinder, and the release valve is connected direct to the exhaust port by a small pipe.

The magneto is mounted directly behind the cylinder, and the magneto chain case is so constructed that it does not in any way interfere with the removal of the crankshaft. The driving chain is covered in, and a belt drive of reasonable length is arranged. The engine fixing is particularly stout, and there is no fear of rattle or looseness developing at this point. Lubrication is by drip feed, and the tank fittings are all excellent, while the change-speed gate is of substantial proportions. The gear box is separate from the engine and is of the double dog type, having a cork insert clutch of ample dimensions carried within the driven sprocket. It is handle-bar controlled, and the gear box is so mounted that the holding down bolts are quickly accessible for chain adjustment.



Piston, crankshaft, and connecting rod of Allon two-stroke, which may be withdrawn after removing the lower half of crank case.

The price, as described, will be £38; without clutch, £36 10s.; and single-geared model will be listed with a countershaft at £28.



The new 292 c.c. two-stroke Allon, which is conspicuous for its sloping top tube and low saddle position.

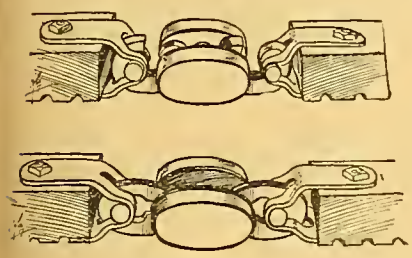
General Accessories

In the following pages we deal exhaustively with a variety of accessories and equipment specialities which help to render the lot of the motor cyclist easier and more pleasurable. Many a rider who is already in possession of a mount will be attracted by one or other of the handy fittings dealt with, whilst others on the point of ordering a new machine will find the review of great convenience in selecting the most suitable equipment for himself and his mount. The review does not profess to be complete—indeed that would be impossible in the space at our disposal. For ease of reference the items dealt with are subdivided under the following headings :

(1) General Accessories. (2) Tyres and Clothing. (3) Electrical Appliances. (4) Lamps.

Forward Links and Fasteners.

The two belt fasteners shown above are ingenious devices for lengthening a belt which is too short, owing, perhaps, to the closing up of the adjustable pulley. It is interesting to note that the



connecting link is leather lined, and consequently it is noiseless in action, and does not interfere in any way with the working of the belt. These links are made suitable both for the King hook (above) or the Forward fastener (below).

The Forward Motor Co., Summer Row, Birmingham.

Bowden Specialities.

The Bowden lever is, without doubt, familiar to all our readers, but there are few who have taken the trouble to take one of these to pieces and see how beautifully it is made. It will come as some surprise to many when it is shown by means of an illustration that the Bowden lever comprises a beautifully made little

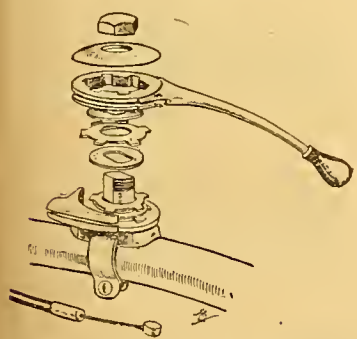


plate clutch, similar to the plate clutches found in hub gears. It will be seen that the centre portion of the lever itself is castellated, and suitable plates engage with the castellations, while on the spindle between the castellated plates are circular plates, which are fixed so that they cannot turn on the central spindle. In this manner the smooth and yet stiff working of the lever is assured.

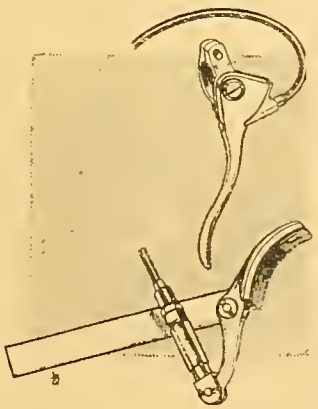
It may be remembered a band brake device has been brought out by Bowden Wire, Ltd., for the purpose of operating the Philipson pulley, which is usually done by application of the foot, which, though it works well, has a somewhat deleterious effect upon the shoe leather. The new design Bowden control for the Philipson pulley has now been considerably simplified, and is similar in design to a locomotive brake brought into action by means of a Bowden wire on the handle-bar.

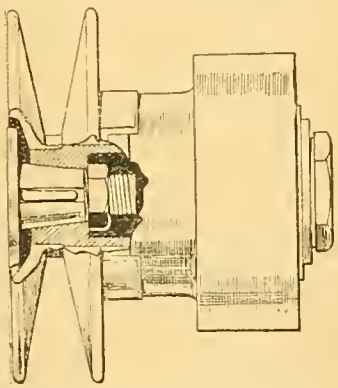


Messrs. Bowden Wire, Ltd., 37-41, Pratt Street, Camden Town, N.W.

The Philipson Variable Gear.

The Philipson pulley and variable gear is so well known that a description is quite unnecessary. We will, therefore, content ourselves with calling attention to a small improvement in the internal mechanism which has recently been made. Some trouble was experienced by thoughtless users of the pulley in over-retarding the governor, the result being that the coiled spring in the governor box occasionally broke. The spring was fastened to the centre bush by means of a set screw and washer. The improvement consists in inserting a leather cam bolster, which extends a certain distance round the circumference of the bush, and which is attached by means of a set screw only. The washer used under the screw head is thus dispensed with.

We understand that the cam bolster has proved entirely successful, and that it



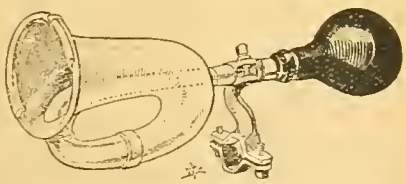
Philipson patent automatic governor pulley. The illustration shows pulley fixed to engine.

can be fitted to existing governor pulleys. It is quite an easy matter to fit it, and it is well worth it, as the cam gives a much smoother action to the working of the governor, and all undue strain to the spring at the fastener screw is done away with. The Philipson governor pulley is perhaps the simplest gear available for fitting to existing machines.

Philipson and Co., Holland Street, Astley Bridge, Bolton.

A New Rotax Horn.

The horn which is shown in the accompanying sketch is sold by the Rotax Motor Accessories Co. It is rather peculiar in construction in that part of the

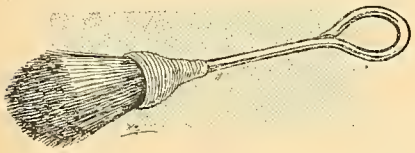


twist is hidden in the bell mouth of the horn. This gives it a pleasing appearance, and renders it far easier to clean than a horn in which there are numerous turns. It emits a clear, audible, and by no means unpleasing sound.

The Rotax Motor Accessories Co., 43, Great Eastern Street, E.C.

An Engine-cleaning Brush.

We have received a sample of an engine cleaning brush from the Motor Factoring Co. It is an exceedingly well-made little article, and has been so constructed that the hairs cannot pull out.



It is, moreover, of a very convenient size, and can be easily carried in the tool bag. Motor cyclists have been long wanting a brush of this kind. The price is moderate—1s.

The Motor Factoring Co., 113, Clerkenwell Road, E.C.

Small Machine Tools for Motor Cyclists.

It is the nature of motor cycle riders to become enthusiastic amateur engineers, and it is not surprising, therefore, that a very large proportion of them soon become exceedingly handy in effecting their own repairs. After the acquisition of the machine the workshop gradually grows, and as time goes on and the rider becomes more of an expert, he is anxious, through the sheer love of doing his own work, to improve and add to its equipment. It is for the handy man who is a clever amateur mechanic that Messrs. Drummond Brothers specially cater. We illustrate herewith one or two of the neat and serviceable small machine tools for which this firm are responsible.

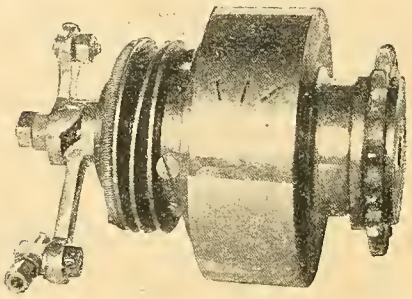
There is a 3½in. screwcutting lathe, which is also suitable for boring, milling, and drilling. The special T-slotted table enables quite large work to be bolted down for boring, etc., as the slide rests may be easily removed by loosening one nut. A neat trip gear is provided which prevents the saddle from over-running and damaging the lathe or work.

Another very popular Drummond tool is that illustrated and known as the 4in. Precision lathe. Owing to its simple design the manufacturing costs have been reduced, and a lathe capable of dealing with practically any operation which can be performed by the 3½in. lathe has been placed on the market at an exceedingly moderate cost. The two lathes described may be driven either by power or by means of a treadle.

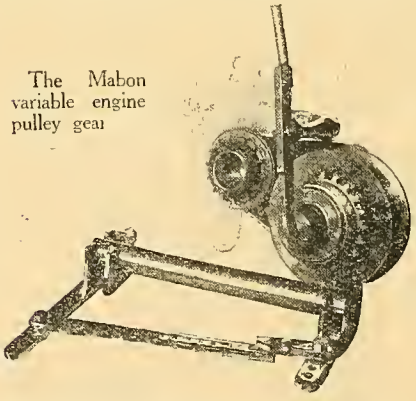
Drummond Bros., Guildford.

Variable Pulley Gear.

The two excellent articles, a plate clutch and variable gear, supplied by the Mabon Motor Works, have been on several occasions described in this journal, but an innovation is the plate clutch, illustrated herewith, for chain-driven machines. The photograph gives a clear view of the external clutch spring, which is adjustable, and the two inclined planes, which serve to separate the plates inside the clutch.



The variable gear has undergone no alteration since we last described it. The accompanying photograph shows the two chain sprockets mounted on a bracket, which pivots on the crankshaft centre and also the adjustable pulley, the opening of which is varied by the operation of a single lever according to the gear ratio required. Owing to the expanding pulley being eccentrically mounted, the opening of the flanges is accompanied by the varying of the distance from the centre of the pulley to the centre of the



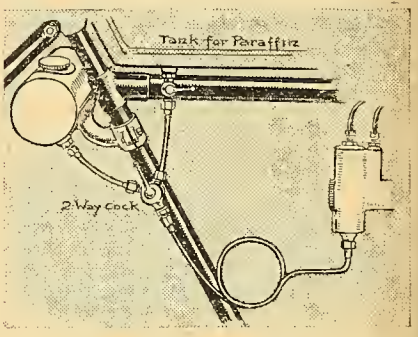
The Mabon variable engine pulley gear

back wheel, thus taking up the slack of the belt and keeping it always at the correct tension. Our photograph also shows the control rod and the ratchet, which is attached to the secondary tube, of the motor cycle frame. This has also at its extreme right a free engine notch, which is obtained by expanding the pulley to its fullest extent, when the belt runs on a loose ring.

Mabon Motor Works, Woodside Gardens, Bruce Grove, Tottenham, N.

How to use Cheap Fuel.

The Binks ingenious jet damping and high velocity carburetter has already been described in detail in *The Motor Cycle*. It remains practically the same for 1915, but Mr. Binks has adopted a method of making it use paraffin. It will be noticed that behind the saddle

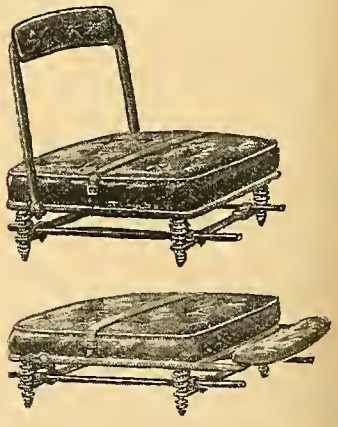


tube a tank for benzole or petrol is carried. The engine is started on the lighter spirit, and afterwards the two-way cock is turned off and it continues to run on paraffin. Mr. Binks recommends a special kind of paraffin which costs 10½d. a gallon, and is sold by him in forty gallon casks, but ordinary paraffin will answer the purpose.

Messrs. Charles Binks, Ltd., Phœnix Works, Church Street, Eccles, Manchester.

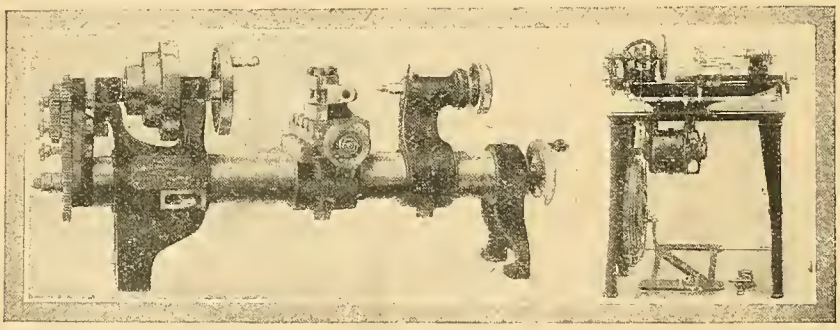
A Passenger Seat.

A very useful accessory is the Tynesider seat with backrest. The accompanying illustrations show the method of springing the platform upon which the seat is mounted. It will be noticed that it may



be used for an extra passenger on the carrier, the back can be raised and used for the driver, or another use to which the accessory can be put is that of a well-sprung luggage platform.

Messrs. The T. Eltringham Henderson Co., 25, Albion Road, North Shields.



Two types of the Drummond lathe.

THE
HENDEE MANUFACTURING COMPANY'S

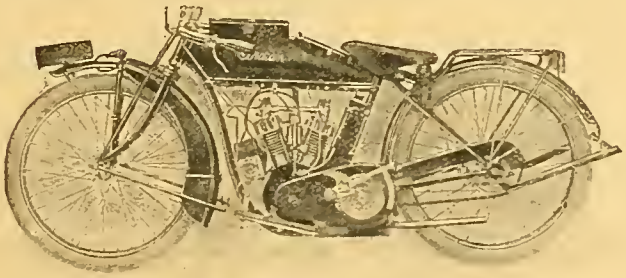
MASTERPIECE.

Expert and novice alike agree that the

1915

Indian

is as near perfection as possible.



MODEL A 3½ h.p. Fitted with 3 speed gear.

The beauty of line and compactness of design are unique, and all the outstanding features show originality in every direction.

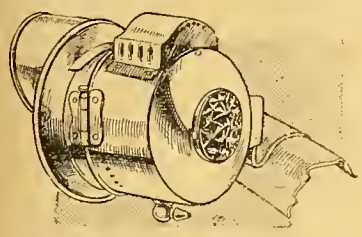
C.D.C.

P. and H. Lamps.

Among the numerous lamps sold by Messrs. Powell and Hanmer, which are of all types and sizes, suitable for all grades of motor bicycles, we noticed comparatively few alterations, the same standard of excellence being maintained throughout. The accompanying illustration shows an ingenious form of sidecar

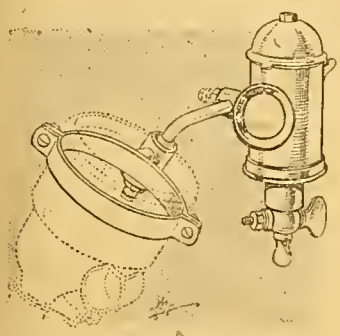


lamp attached to a bracket fixed to the sidecar mudguard. It will be noticed that it shows a white light in the front, and has a red glass at the back.

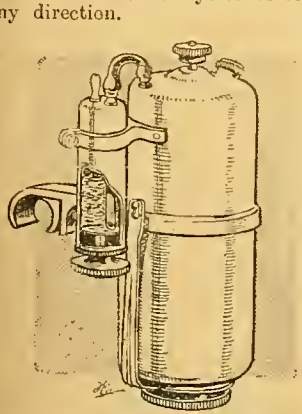
Messrs. Powell and Hanmer, Chester Street, Birmingham.

Lamps and Generators.

Messrs. J. and R. Oldfield, the manufacturers of the well-known Dependence lamps, have recently paid considerable attention to the wants of motor cyclists. They have been the pioneers in introducing small handle-bar acetylene lamps



for the purpose of illuminating speedometers, clocks, etc. The accompanying sketch shows a lamp recently put on the market, fitted with an ingenious ball joint, for the purpose of illuminating the speedometer; while the ball joint referred to enables its rays to be directed in any direction.



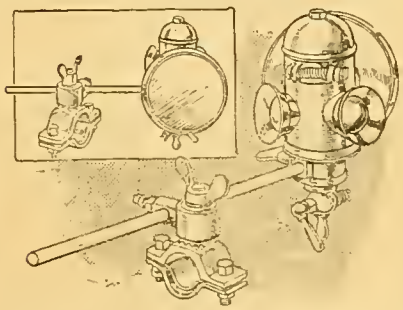
Messrs. Oldfield have also brought out a very well designed and substantially built generator. Contrary to motor cycle practice, it is fitted with an efficient condenser, which is filled with horse hair, and has the effect of drying and purifying the gas before it passes to the burners.

Messrs. J. and R. Oldfield, Refulgent Lamp Works, Warwick Street, Birmingham.

A Double-purpose Lamp.

Few men in the motor cycle business have had more experience in the accessory line than Mr. H. Taylor, who, for the past eleven years, has made a special study of the wants of motor cyclists.

The accessory which appealed to us most on the occasion of our last visit to his showrooms was a useful double-purpose handle-bar lamp, which we illustrate herewith. It is exceedingly well made, and is built to last. The two windows show a red light to the rear, and a white light which illuminates the



speedometer, clock, or route card. By day the lamp may be turned round, and a convenient mirror will be found on the other side.

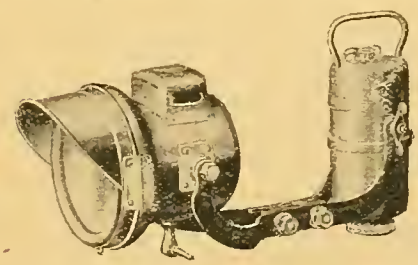
A lamp similar to the above, but of simpler design, is a tail light for sidecars. Both in this and the handle-bar lamp, the lid which acts as a ventilating cowl is kept in position by means of a powerful spring. The surface of the crossbar, which forms part of the scheme of construction, is roughed so as to enable matches to be struck upon it.

While still on the subject of lamps we may mention a useful sidecar lamp bracket, designed to fit upon any convenient portion of the sidecar chassis. It is made so that it can be adjusted to suit requirements.

H. Taylor and Co., 21a, Store Street, Tottenham Court Road, W.C.

The Miller Motor Cycle Lamp.

Miller's lamps for motor cycles are made in a variety of sizes, and are well designed and soundly constructed articles. The larger sizes are fitted with Mangin

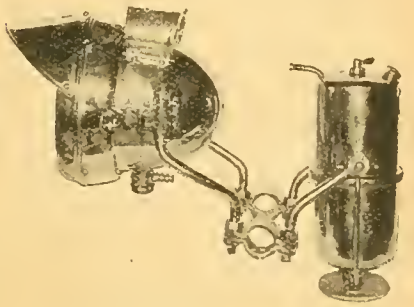


mirrors, and give an excellent light. Miller's Rearlite, which is attached to the right handle-bar and supplied with gas from the main generator, is also a useful article. By day, this can have a mirror clipped over it to give a view of the road behind.

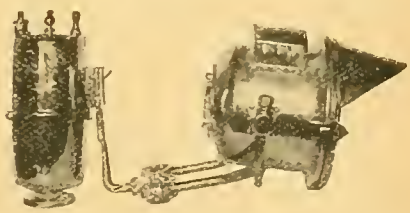
Messrs. H. Miller and Co., 60, Miller Street, Birmingham.

Rotax Lamps.

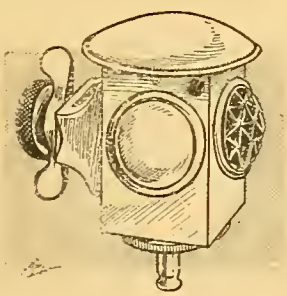
The Rotax Co. has made a special study of lamps for motor cyclists, and those which we illustrate give a clear idea of the various types they have placed on the market for high-powered, medium-powered, and lightweight machines. The lamps are manufactured



at the company's own works at Willesden, and are strongly built and highly suitable for motor cycle work. All the generators are practically of the same pattern, and the method of holding the container on to the water tank is worthy of note, and is most effective. A U-shaped piece is hinged about two clamps



which fit on to the bracket forks, and in the centre of the U is a large milled screw which presses the container up against the tank. The carbide is not placed in the container itself, but in a separate box, the bottom of which is perforated so that the carbide "ash" can shake down to the bottom of the

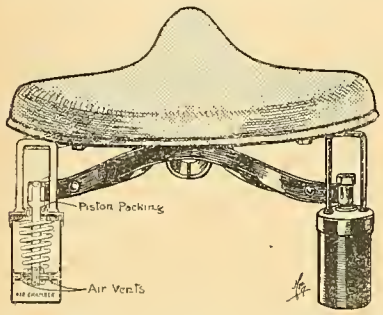


container. The water does not drip direct on to the carbide, but goes into a perforated tube, from which it is more equally distributed on to the fuel. The last sketch shows a neat acetylene tail lamp for a sidecar combination.

Rotax Motor Accessories Co., 43-45, Great Eastern Street, E.C.

An Air Cushion Saddle.

For the first time in this journal we are able to give a description of the Messinger saddle fitted with air cushion springs, similar to the shock absorbers attached to the ends of the springs of motor cars. Naturally, the most interesting point about the saddle is the system of suspension, which the accompanying illustration clearly demonstrates. The lower frame of the saddle is securely connected to the ends of the piston rods, one on each side. The pistons work in air barrels which are carried by yokes clipped to the saddle frame. The piston rods pass through holes in the heads, and are packed so that there is no metal-to-metal contact, and the wear is thus reduced to a minimum. Each piston is fitted with air vents, and the space in the barrel below this is used as an air chamber. Before the weight applied,

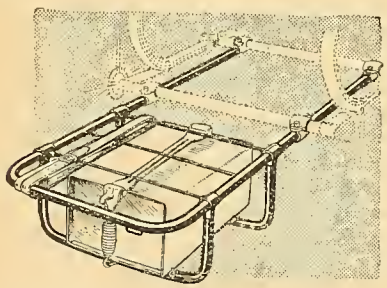


the piston in each barrel is at the bottom of its travel, and there is an air cushion beneath it, but under road shocks the barrels are thrust downwards until the pistons occupy a position about half way up the barrels. The springs are then compressed, and the air is passed from above to below each piston through the vents. On the rebound the barrel rises and the springs extend, but the air cushion prevents violent motion, as the air passes through the vents slowly enough to give a gentle cushioning effect.

Messrs. Morris, Russell and Co., 75, Curtain Road, E.C.

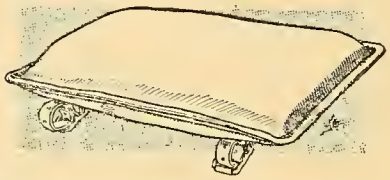
A Strong Luggage Carrier.

A visit to the showrooms of Messrs. A. W. Gamage is always an education. A cleverly designed luggage platform for use on sidecars is shown in the accompanying sketch. It will be noticed that



the platform has a dropped frame for carrying a petrol can, which is kept in position in a particularly ingenious manner. A bar rests on the top of the can, and two clips, kept in position by strong springs, serve to hold the can tightly pressed against the frame so that it cannot move. The top of the grid, of course, is used for luggage, and strap eyelets are placed conveniently at the back of the platform for fixing on the luggage.

Those who are given to the delights of carrier riding will appreciate the



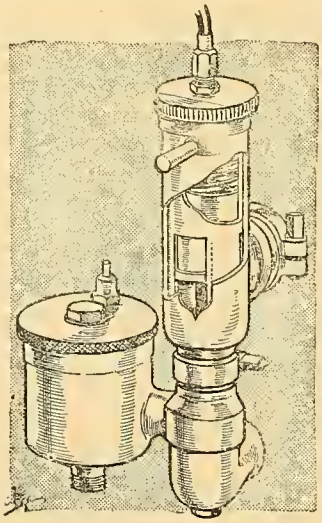
cushion which we illustrate herewith. It is provided with straps for attaching to the luggage carrier.

Messrs. A. W. Gamage, Ltd., Holborn, E.C.

The Scott Carburetter.

The sketch which we reproduce herewith gives a clear idea of the working of the new Scott carburetter.

The carburetter is of the single lever type, but is provided with an auxiliary air shutter by means of which a portion of the fixed air supply may be restricted. The automatic shutter is procured by means of a single piston which uncovers the throttle as it uncovers the air port. If it is desired to strengthen the mixture the side lever which operates the inner sleeve is moved, with the result that the

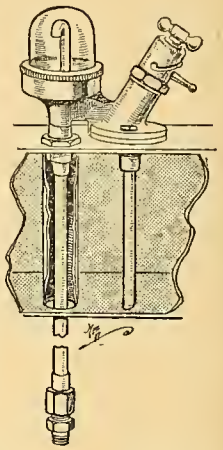


quantity of air drawn in is reduced, but the throttle opening remains the same. It is claimed that since both ports are rectangular both are opened absolutely in proportion. The makers say that to obtain the greatest possible economy the air port should be nearly fully open, and for the maximum amount of power it should only be about half open. The carburetter illustrated is suitable for standard 3½ h.p. single-cylinder machines, or for 6 h.p. twins.

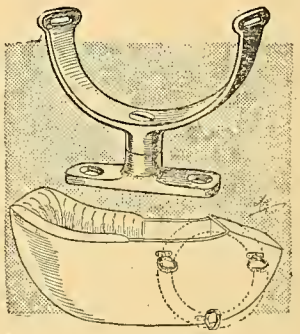
Messrs. William Scott and Son, 153, North Street, Glasgow.

Lubrication Specialities.

Messrs. Benton and Stone, Ltd., have, during the last few years, given a great deal of attention to the motor cycle business, and have brought out many interesting and novel accessories. Probably, the company is best known for the manufacture of lubricating devices. The type illustrated is known as the Enots automatic drip lubricator. It consists of an automatic drip feed, regulated by means of a needle valve. The flow of oil to the crank case is induced by suction. The drip feed is, of course, controllable, but if at any time it is required to give the engine



an extra supply of oil, the lever is given a half turn and the oil will continue to run in a steady stream until the lever is returned to its normal position.

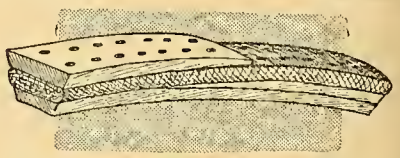


The other sketch shows a set of tyre carriers sold by Messrs. Benton and Stone for attaching to sidecar bodies. The stem of these carriers is swivelled so that the plate may be attached in any position and accommodate the sweep of the tyre to the lines of the car.

Messrs. Benton and Stone, Ltd., Bracebridge Street, Birmingham.

A Chrome Leather Belt.

A new pattern Balata and chrome leather combination belt has been introduced by Mr. W. Pollin, who is a pioneer in belt manufacture, having been occupied in making belts from the very earliest



days of the motor cycle movement. This inventor has been experimenting for some time with Balata in combination with leather, and the main feature of the new pattern is the method of riveting the materials together. The ordinary steel eyelet, as used in former patterns, had a tendency to cut the strands of the woven material and so weaken it to a large extent, whereas the new pattern contains a double row of small gauge solid rivets, all fitted and clenched by hand. This forms a complete metal stitching.

Mr. W. Pollin, Shepherdswell, Dover.

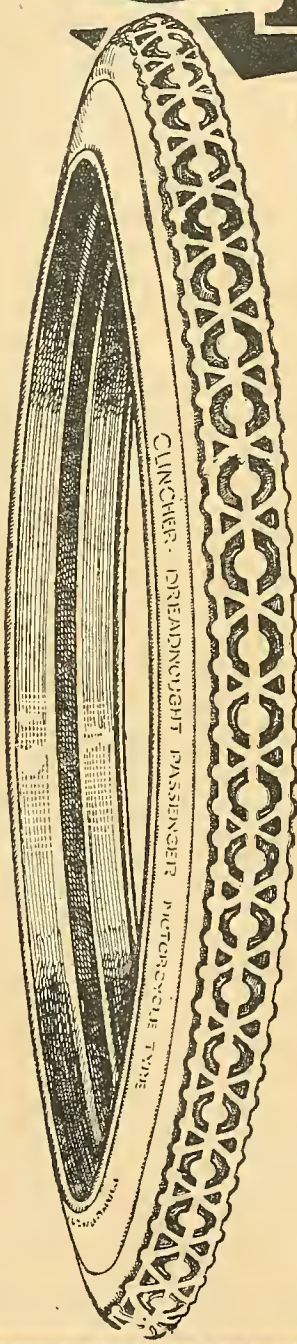
CLINCHER



MOTOR CYCLE TYRES.

NEW PATTERNS FOR 1915.

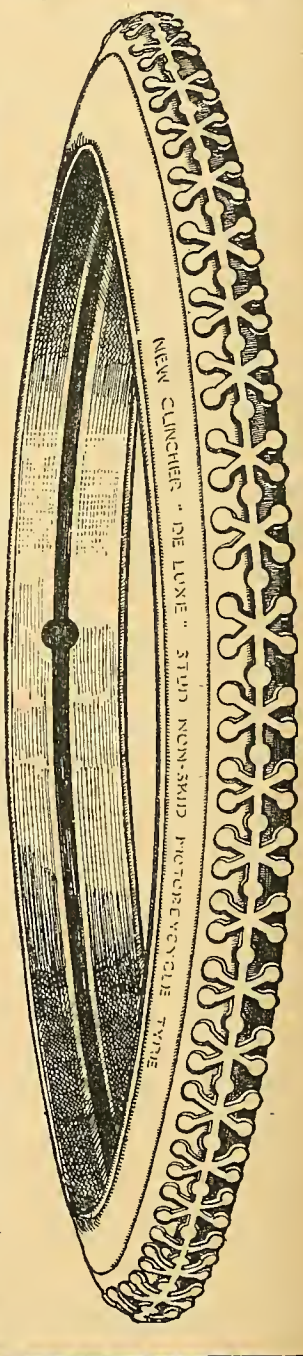
THE IDEAL TYRES FOR HARD WEAR.

DREADNOUGHT PASSENGER (left-hand design).—This tyre has hitherto achieved remarkable success on almost every type of machine, and the various mileages reported range between 5,000 and 22,000. It is constructed so that it will stand up to the road and present a good square running surface, while the casing is of such a quality that it will allow perfect flexion in the walls, to the comfort of the rider and protection of the machine. We have further improved the construction for the coming season by the addition of crossed ribs extending between the studs and by the enlargement of the centre row. This gives the tread a much greater substance and renders it a perfect non-skid, and without question it is the finest tyre on the market for Heavy Solo or Passenger work on machines up to 8 h.p.

"DE LUXE" (right-hand design).—This has been greatly improved both in quality and construction for the coming season. The rubber has been changed from the former grey to a tough white quality, which will better stand the strain of the ordinary type of machine. The tread has also been improved by the addition of crossed ribs extending between the studs, thus giving a heavier and thicker wearing surface and a more reliable non-skid.

It is made in three weights—"Heavy" for machines up to 4 h.p., "Extra Heavy" for machines up to 6 h.p., and "Junior" for machines up to 2¾ h.p.

In the Extra Heavy pattern there are three millimetre sizes for Round Base Rims. It is also made in Wired Edge for those who prefer this type for racing purposes.



MANUFACTURED BY

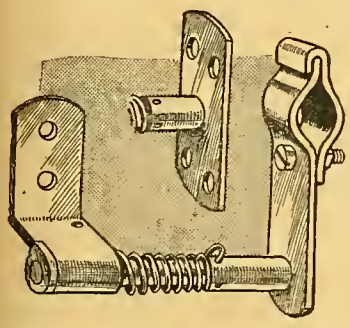
The North British Rubber Company, Limited,

169, Great Portland Street, London, W.

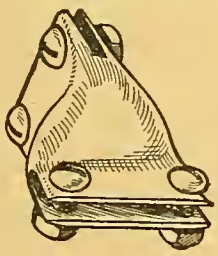
Factories: Castle Mills, Edinburgh.

Spring Lamp Brackets.

A. H. Hunt is best known as a dealer in electrical accessories, but the accompanying sketches show that the firm by no means confines its attention to this class of goods. The two spring brackets illustrated are for carrying oil tail lamps, the idea being that a lamp which is properly sprung will also keep alight and is less liable to damage. An



interesting form of adjustment is provided. One end of the coil spring is anchored to a movable portion of the bracket, while the other end is anchored in a hole on the fixed portion, so that if a heavier lamp be fitted the tension of the spring can be altered. These brackets are made in two patterns, one of which is intended to be attached to the carrier of a motor cycle, while the other may be screwed on to the bodywork of a sidecar.



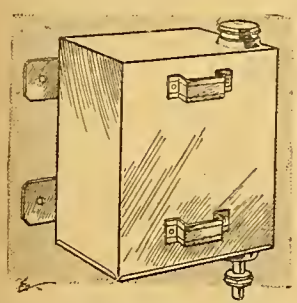
Another interesting little accessory is the H.H. badge holder for fixing to the number plate. It is a neat pressing out of a piece of tube.

It is interesting to note that the "clutch" adhesive insulating tape which is a speciality of this firm is now British made.

Mr. A. H. Hunt, 115, Cannon Street, E.C.

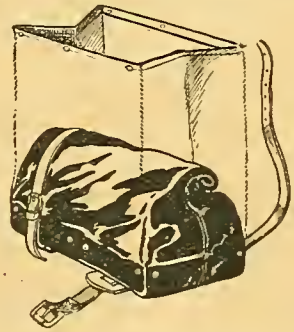
An Extra Petrol Tank.

The handy little extra tank which we illustrate follows very closely a design suggested in *The Motor Cycle* for petrol consumption competitions. It will be



noticed that means are provided for strapping the auxiliary tank to the main petrol tank.

The man who tours, or the despatch rider, is often at a loss as to how best to pack up his kit. The folding valise, a sketch of which we reproduce, is a thoroughly serviceable article. It is constructed of patent leather, which we are assured will not crack. It is absolutely waterproof and very capacious.



The Service Co., Ltd., have also introduced a new tyre gaiter, which is particularly well made, and is constructed of the finest Egyptian canvas and strengthened by means of the best chrome leather.

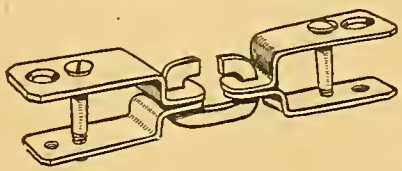
The Service Co., Ltd., 292-293, High Holborn, W.C.

A Patriotic Mascot.

A mascot of interesting design and suitable for the present period is that now being marketed by the Stentophone Co. As the illustration shows, it is of a distinctly patriotic nature, the bulldog's head and shoulders being surrounded by French, Belgian, Russian, and English

flags. It is sold in three styles, *i.e.*, antique bronze and polished brass, antique silver, or heavily lacquered. The price is 2s. 6d. in either of the three styles

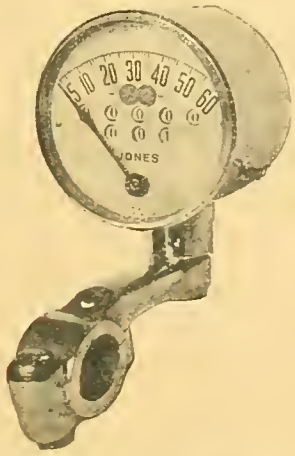
The Stentophone Co., 36, South Road, Hockley, Birmingham.



A strong hook fastener for high powered machines, and having double screw fixings. It is sold by John Piggott, Ltd.

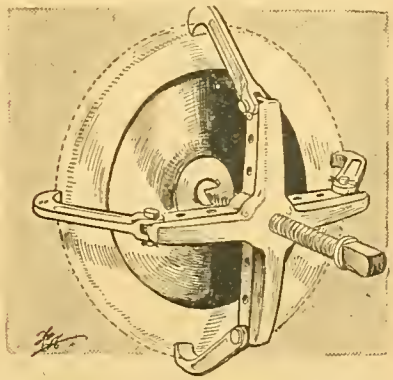
The Jones Speedometer.

Among the first successful speedometers for use on motor cycles was the Jones. This, as our readers are aware, works on the centrifugal principle, and has long been a popular accessory. Our illustration shows the clearness of the figures, a point which is of great value to motor cyclists. There has been an in-



creased demand for speedometers registering in kilometres per hour, and these instruments especially appeal to motor cycle despatch riders on the Continent, where all distances are marked in kilometres.

One of the most useful accessories ever sold by this firm is the Giant wheel drawer. A modified form of this useful tool was also adopted for motor cycle



pulleys, and recently another improved form with four legs has been brought out for removing any kind of pulley or the flywheels of lightweights.

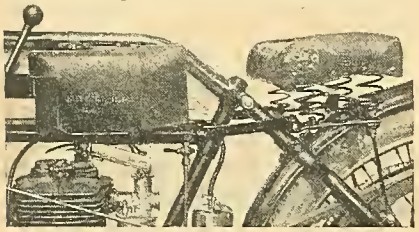
Messrs. Markt and Co., Ltd., 98-100, Clerkenwell Road, E.C.

Knee-grip Seat.

This combination seat is expressly designed to take in all the requirements of motor cycling. It departs from the usual pedal cycle saddle form, and embodies a new principle of riding, well known to every horseman—that of control by the knees. Motor cycling, with its great pace, and consequent vibration, requires a seat in which one can reduce the road shock by rising from it, and this can be brought about by means of a knee grip. Engine vibration at speed is coped with in this seat by in-

General Accessories.—

troducing car cushion springing in combination with a 1½in. thick feather pad, which can be removed and shaken up. The rider by use moulds the top of the seat to his form, thus ensuring the greatest comfort. The knee grips are in the form of bags; they are of solid hide cut in one piece, and are made to serve

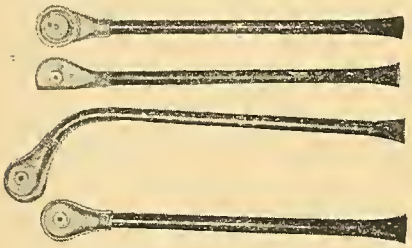


a useful purpose, as each carries a metal box. They also keep the legs upright in a natural position, and off the hot engine. The modern requirement of a low riding position is given in a great degree.

The Kumfurt Motor Accessories Co., Cookham, Berks.

Willers Extension Pipes.

We illustrate herewith four types of Willers extension pipes designed to fit various makes of motor bicycles. These extension pipes serve to reduce the

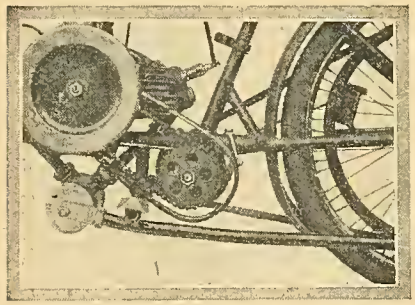


noise without in any way causing back pressure. These are made to fit various machines.

Messrs. Willmott Bros., 51, Prince of Wales Road, Norwich.

Clair Silencers.

The Clair silencer, it may be remembered, consists of a nest of drilled cups, which successfully break up the exhaust gases, rendering their exit quite silent



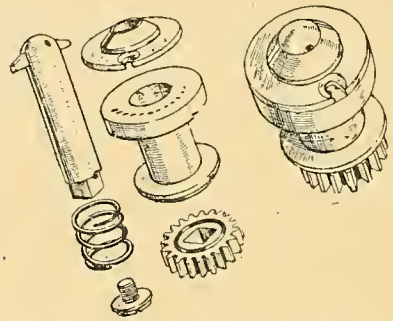
without exerting undue back pressure. The Clair was originally a French invention, and gained an exceedingly high award in the A.C.F. Silencer Trials many years ago. Messrs. Lyell have bought up the patents and now manufacture these themselves. Ingenious end plates and adapters have been made, rendering the Clair silencer suitable for all makes of machines.

Messrs. J. C. Lyell and Co. also make a speciality of oxy-acetylene welding, and sell a plant for accomplishing this work. They are exceedingly expert in repairing broken castings, and thoroughly understand the requirements of motor cyclists.

Messrs. J. C. Lyell and Co., 115, Great Portland Street, W.

The Wilkinson Twelve-jet Carburetter.

Some detail alterations of considerable interest have been made to the Wilkinson twelve-jet carburetter. The main features remain the same as before, but the jet control has been somewhat altered. Instead of opening up a series of jets up to twelve in number, leaving all open at once, the jet valve is now arranged in the form of a flat plate with a gap



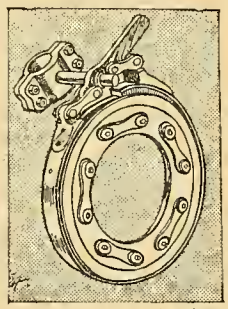
in one side. As this is rotated the first jet is opened, and just before it again starts to close the second jet begins to open. Thus, though the jet area constantly increases as the valve is rotated, there is never more than one and a fraction of a second jet exposed at one time.

Another modification takes the form of a hole drilled in the centre of the valve stem with two inclined outlets at the top, and similar holes partly on and partly above the part of the stem squared for the reception of the pinion. Besides acting as an air vent, this lead ensures any fuel which might leak back into the rack chamber, when the carburetter is flooded for starting, being sucked back into the engine. This helps to give easy starting, and ensures absence of wastage.

Mr. J. H. Wilkinson, 40, Jubilee Road, Doncaster.

A Fibre-lined Brake.

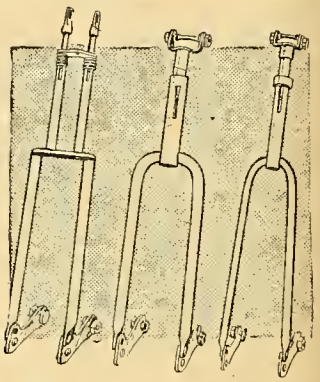
The speciality of this firm is a band brake which is fibre-lined. It is easily fitted to existing makes of machines and is suitable for the heavier types of motor bicycles, especially with sidecar attachments.



Messrs. Ukantes, London Colney, Herts.

Spring Fork Attachments.

Among the Kerry list of accessories we may mention a series of excellent spring forks designed to be adapted to motor bicycles of ancient manufacture, which are fitted with forks of the single or rigid type, and it is surprising how many of these are still in use. These forks are known as the Readhead

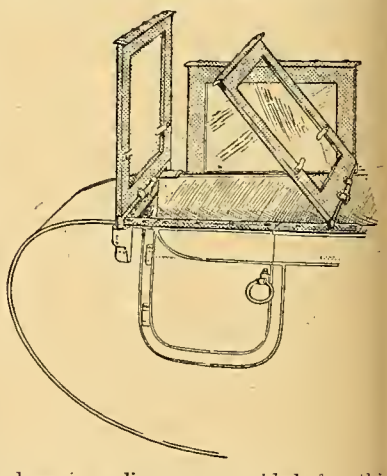


girder spring fork attachments, and are made suitable for lightweights of 2½ h.p., for medium-powered machines of about 2¾ h.p., and for full touring mounts.

The East London Rubber Co., Ltd., 29, Great Eastern Street, E.C.

A Sidecar Windscreen.

One of the most ingenious wind screens that has yet been produced for sidecar work has just been brought out in conjunction with a special body. When out of use the screen drops inside a panel of the body, and besides being invisible, is quite out of harm's way and cannot be damaged. At a moment's notice the screen can be lifted out and fixed at any desired angle, either at the front of the body or behind the sidecar door. In this latter position it can be sloped forward to act as a paper or book rest,



and spring clips are provided for this purpose. Any change in position of the screen can be made by the passenger while the machine is travelling, and it is but the work of a moment to swing the screen to one side so that one can enter or leave the seat. The body has graceful lines, and is very tastefully finished and upholstered.

The Light Car Body Co., Fleetwood Works, Union Street, Coventry.

REMEMBER:

Every Dunlop tyre bought helps to support the workpeople of your own country; and every foreign tyre bought—European or American—is a blow aimed at the workpeople of your own country.

The DUNLOP price reduction

Heavy type (3-ply casing) beaded-edge, for heavy solo and medium passenger work.

Extra Heavy type (4-ply casing) beaded-edge, on round base rim, for heavy passenger work. Made in 650 x 65 mm. size.

ITS design, its method of construction, and its quality render the patented Dunlop rubber-studded motor cycle tyre the finest ever produced.

And now that the prices are down, take advantage of your opportunity. Specify Dunlops for your new mount, and set your mind at rest on the tyre question.

Here are a few examples of sizes much in demand :—

		Cover.	Tube.
Ribbed Motorcyclette	24 x 2	12/-	6/6
" "	26 x 2	14/3	6/9
R.S. "	24 x 2	16/3	6/6
" "	26 x 2	17/6	6/9
" Light	26 x 2	20/-	6/9
" Heavy	26 x 2⅜	30/6	8/6
" Extra Heavy	26 x 2⅜	37/9	8/6
" " "	650 x 65	41/-	10/6
Three-Ribbed "	650 x 65	34/6	10/6
Sidecar Extra "	26 x 2½	23/-	8/9
Combination Rubber and Steel-studded	650 x 65	55/9	10/6
R.S. Heavy Wired-on	26 x 2¼	28/-	7/9

There is a big saving on some of these tyres. The full list of 52 types and sizes is given in the A.R. leaflet (free). Get a copy from your agent or from any of our branches, note the price which interests you, and give your order straightaway.

THE DUNLOP RUBBER CO., LTD.,

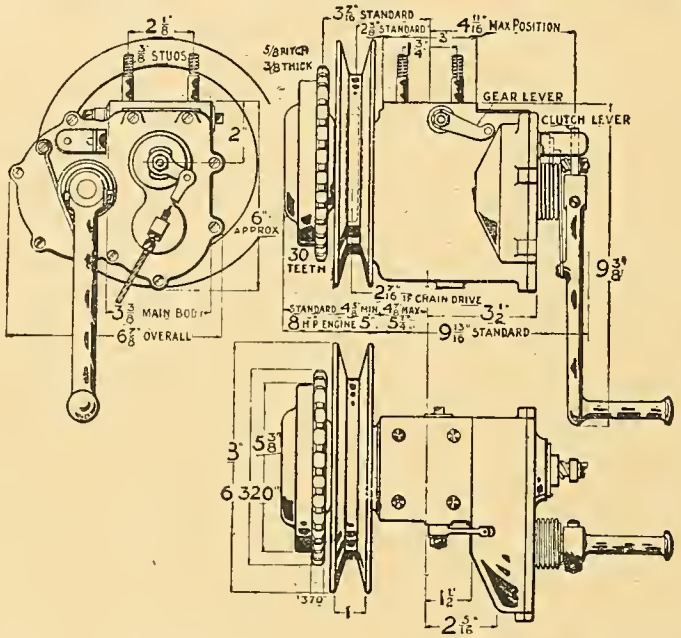
Aston Cross, BIRMINGHAM; and 146, Clerkenwell Road, LONDON, E.C.

Branches—Coventry, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

DUNLOP SOLID TYRES FOR HEAVY COMMERCIAL VEHICLES.

TRADE MARK.

THE NEW STURMEY-ARCHER COUNTERSHAFT GEAR IS A REVELATION



Adopted for 1915 by the leading Motor-cycle Manufacturers. 3-speed & enclosed kick-starter.

Suitable for Motor-cycles from 3 to 6/8 H.P. Gears constantly in mesh, and may be changed at any time without declutching or raising Exhaust lifter. Clutch is of the cork inset type, operated from handle-bar, and very smooth in action.

Kick-starter completely enclosed, constantly in mesh, with safety device to prevent injury should a back fire occur.

Weight of gear complete, 24 lbs. Can be supplied either with combined chain and belt drive or all chain drive.

Write To-day for reduced prices of S.A. 3-speed Hub Gears as supplied for Russian and British War Office Motor-cycle Contracts.

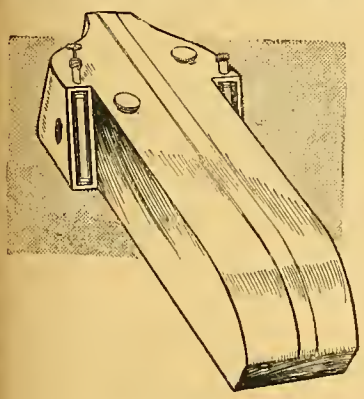
SEND FOR DESCRIPTIVE BOOKLET, POST FREE.

STURMEY-ARCHER GEARS, Ltd., NOTTINGHAM.

In answering this advertisement it is desirable to mention "The Motor Cycle."

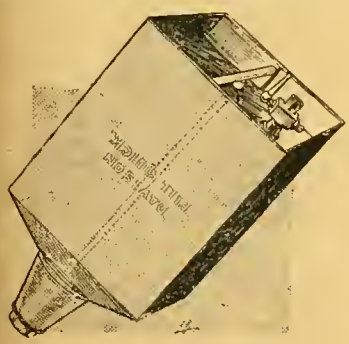
Visible Petrol and Oil Gauges.

Few people in the accessory trade have displayed more ingenuity in the design of useful fitments than Mr. A. C. Davison. One of his latest ideas is an excellent form of motor cycle tank, to which he has adapted his gauges. The accompanying drawing will show that these are readily visible, thus showing the quantities of oil and petrol in the tank at a glance.



Previously, the complaint has been that petrol gauges are not easily seen from the saddle. Another point about the tank is the carrying of oil in a totally separate box inside the main tank, thus greatly adding to the strength of the oil tank and preventing the tiresome leakage between the two compartments, about which so many riders have complained from time to time.

The other accessory we have to deal with under this heading is a petrol can specially designed for the use of record breakers and racing men. This is turned upside down and the spout inserted in the



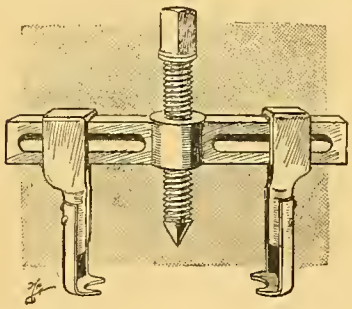
filler cap of the motor bicycle. The petrol is allowed to escape by first of all opening the vent at the top, which takes the form of a tap, and by pressing down the handle, by means of which the exact amount may be easily regulated.

A. C. Davison, 163, Arlington Road, Camden Town, N.W.

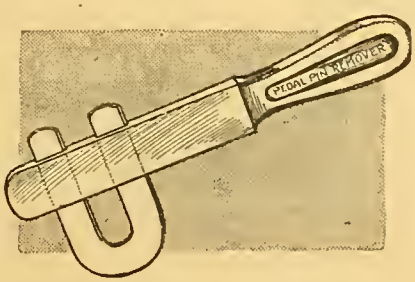
Useful Tools.

One of the most up-to-date firms in the manufacture of useful tools is that of Messrs. Lake and Elliot. A particularly useful little appliance is the Millenmium magneto timing wheel puller. The joints of the arms are made of sheet steel, thinned at the part which goes behind the wheel to be removed, and carefully hardened and tempered. The arms are self-locking as soon as pressure is applied to this screw, and they cannot slide away from the work.

Yet another interesting tool made by this firm is the Millennium pedal pin spanner, which should especially appeal to the owners of lightweights. The flats



on the end of the pedal spindle are extremely small, and it is difficult to find a spanner thin enough to take them and yet strong enough to withstand the necessary strain to unscrew these spindles after the machine has been in use for some time. In the case of this

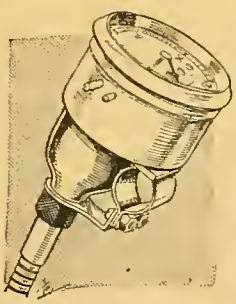


tool the force applied to turn the pedal spindle tends to hold the shoes together, thus giving the necessary firm grip.

Messrs. Lake and Elliot, Ltd., Albion Works, Braintree, Essex.

Watford Speedometer and Magneto.

One of the most successful motor cycle speedometers on the market is the Watford, which works on the centrifugal principle. It owes its popularity entirely to its wonderful reliability, which has been brought about by the extreme care and accuracy exercised in its manufacture. We have had a considerable amount of experience with this excellent little instrument, and we can speak most highly of it in consequence.

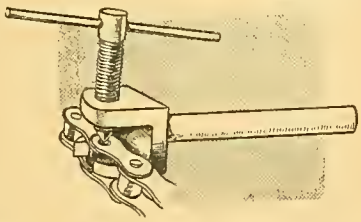


Messrs. Nicole, Nielsen and Co. are also manufacturing a magneto. Their experience in fine and accurate work should stand them in good stead in this new departure, and we have no doubt that it will be a first-rate article.

Messrs. Nicole, Nielson, and Co., Watford, and 14, Soho Square, W.

A Chain Rivet Punch.

Quite a novel accessory, sold by the Service Company, is a chain rivet punch. It is absolutely self-centring, is smaller than any existing similar tool, and is machined out of a solid bar. When the chain link is looped on to the fork end, the punch is opposite the counter-sink of the chain stud, and thus a rivet can be punched out accurately in the dark if

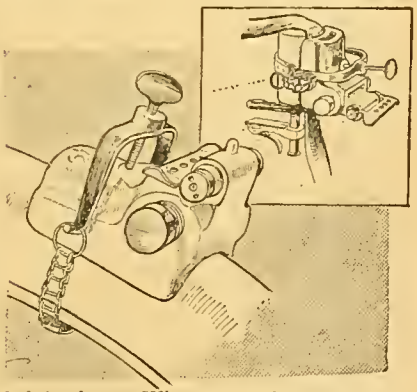


necessary. It is made suitable for the following size chains: $\frac{5}{8} \times \frac{1}{4}$, $\frac{7}{8} \times \frac{5}{16}$, $\frac{3}{8} \times \frac{3}{8}$, while a larger size is also made.

The Service Co., 292, High Holborn, London, E.C.

The Vulcan Vulcaniser.

There are few more useful accessories which form part of the garage equipment than a good vulcaniser, and the Vulcan is one which has been brought out by the well-known firm of Lacoste and Co., especially for motor cyclists' use. It is but a miniature model of the larger Lacoste vulcaniser sold to the owners of motor cars, and, consequently, is a thoroughly well-tried article. It stands a little under 5½in. high, and is worked by opening the shutter shown in the smaller of the two sketches, and inserting therein a small spirit lamp consisting of absorbent wool soaked in methylated spirit placed in the hole designed to receive it; then, after the tyre has been suitably prepared, the lamp is lit, and it

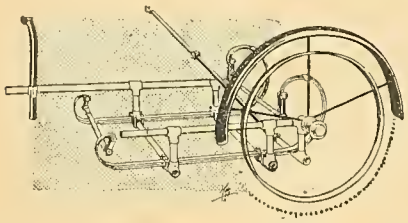


is left alone. When a certain temperature has been reached the white metal surrounding the spindle of the shutter melts, and the spring allows the latter to close automatically, with the result that the flame is reduced and the correct temperature is maintained. The two illustrations show the vulcaniser employed in repairing a badly gashed cover, and also in repairing a punctured tube. The process is very fully described in a well written little booklet which is supplied with each vulcaniser. The box is sold complete with vulcaniser, bench clamp, solution, wood block for a mandrill, and the necessary materials.

Messrs. J. Lacoste and Co., 184 Shaftesbury Avenue, W.

A Dropped-frame Sidecar.

Messrs. Bransom, Kent and Co. especially lay themselves out for the production of inexpensive and extremely neat sidecar bodies and chassis. The

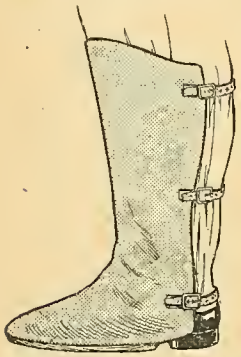


accompanying sketch shows the Dual chassis with dropped frame, which is sold at a very moderate price.

Messrs. Bransom, Kent and Co., 40, Great Eastern Street, E.C.

Gamage's Over-boot.

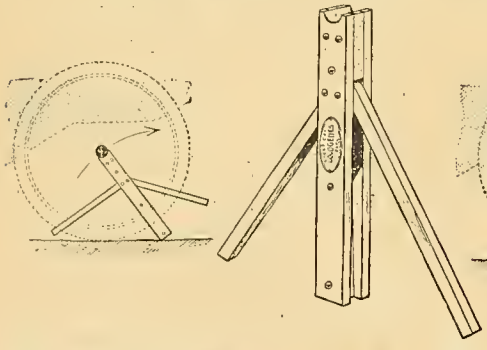
A most excellent over-boot has lately been placed on the market by Messrs. A. W. Gamage, Ltd. The upper consists of waterproof canvas, and adequately protects both the leg and foot. The advantage of such a garment is that it is fixed on with a great deal less trouble than the ordinary overalls, and yet gives adequate protection in the very worst weather, if worn with a long coat.



Messrs. A. W. Gamage, Holborn, E.C.

The Gogogenes Jack

The Gogogenes jack is a light and handy device intended to be used with a light cycle car. It is placed under one end of the axle in a sloping position with the legs extended clear of the ground The car is pulled back on to it, or forward if the front axle is to be raised. When a vertical position has been assumed the legs may be allowed to touch the ground. The car will then be

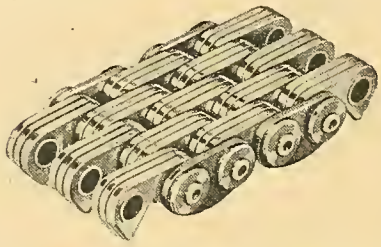


quite steady. Being of wood, it is strong, cheap, and cannot damage the other articles in the tool box. It weighs only 1 lb.

Messrs J. F. Buckingham, Spon Street, Coventry.

A Silent Chain.

This company was the first to adopt the noiseless type of chain to motor cycle use, and was the first to realise its advantages, which lie not only in the silence of the transmission, but also in the fact of its greater suitability for an engine chain, since, as the latter runs at very high speeds, it has been found that

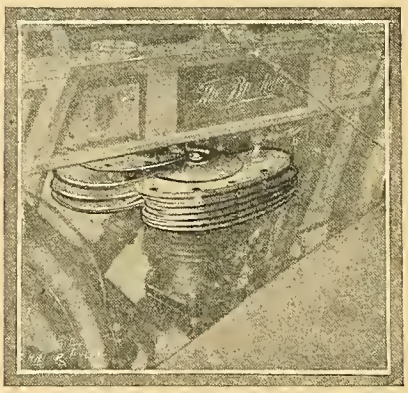


the silent chain is more suitable. The first machine to be fitted with the Coventry silent chain was the Matchless sidecar combination.

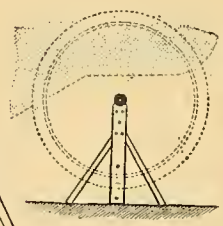
Messrs. The Coventry Chain Co., Spon End Works, Coventry.

Harcourt Radiators.

Considerable interest was evoked on the first appearance of the Harcourt radiators at the beginning of this year. These are aluminium fins provided with



copper separaters which are attached to the ordinary radiating fins of an air-cooled cylinder. We have seen a good many in use, have tried them, and found them to be efficient. They are now made suitable for more than fifty makes of motor cycles, and have proved to be especially useful for two-stroke engines.

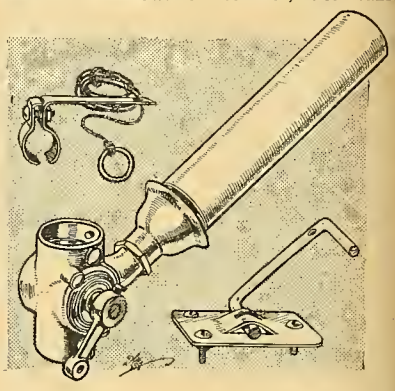


The above illustration shows the Harcourt radiators fitted to a single-cylinder 4 h.p. Bradbury motor cycle engine. It is claimed that they save 50% in the oil consumption and from 20% to 30% in petrol, owing to the efficient manner in which they keep an engine cool.

Messrs. Wylie and Lochhead, Byers Road, Glasgow.

The Simms Exhaust Chime.

Among the various alarms sold for motor cyclists the Simms exhaust chime is especially worthy of mention. An idea of its neat design may be gathered from the illustration, which also shows the two methods of control, the cable

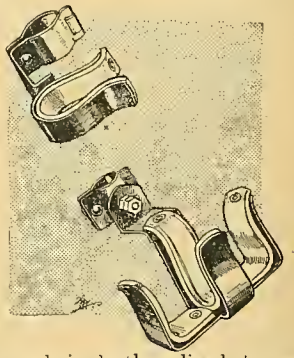


and clip for attaching to the handlebars, or the pedal for screwing on to the footboards. The valve is returned to the closed position by means of a clock spring, which is plainly visible in the drawing.

Simms Motor Units, 191, Wardour Street, W.

A Rifle Clip.

One of the numerous accessories sold by Messrs. Herbert Terry and Sons, which will especially appeal to military motor cyclists, is a rifle clip, illustrated herewith. This is very strongly made of good quality steel, so as to stand rough



usage, and is leather lined to prevent injury to the rifle. The clips are clamped to the forks at the top and bottom. A strong spring action prevents the rifle being shaken out, and the bottom of the clip is adjustable to any angle. When ordering the make of fork should be specified.

Herbert Terry and Sons, Redditch.

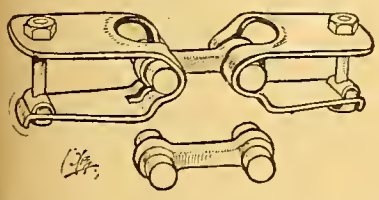
Sarolea Engines.

The Sarolea engines are manufactured at Herstal, near Liège, where so brilliant a stand was made against the enemy. These engines are a well-known and much appreciated Belgian make, and the Tormo Co. hold a good stock. Naturally, owing to the factory being in German hands, no improvements have been able to be made for the coming season. This company also deals in English-made spokes for all types of wheels, and F. and S. ball bearings.

The Tormo Engineering Co., 67-68, Bunhill Row, E.C.

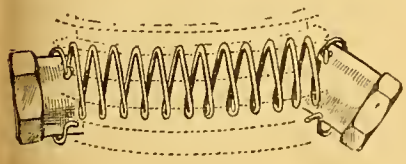
Dall Accessories.

Two very useful accessories are sold by this firm. One is the Dall belt fastener, a most ingenious device which works admirably. The connecting link has a steel roller at each end, and these rollers are pressed into the ends of the fastener through specially large holes. When the rollers are in position the fastener cannot come undone, and, owing to the first-class material employed, excellent wear is obtained. A small point worth mention-



ing is the provision of a U-shaped piece through which the fastener screw runs, which is intended to fit into the bottom grooves of a rubber belt, thus helping to add to the security of the joint. The links are of different sizes, so that by their means a belt which is too slack or too tight can be easily adjusted. We may mention that the price of this fastener has been reduced.

The other device sold by this firm is a trouser guard, consisting of a wire spring hooked round the combustion chamber of



a motor cycle. It serves the very useful purpose of adequately protecting the rider's trousers or overalls from being burnt.

Mr. J. B. Dall, Ladybank, Fife.

A Grease Cartridge.

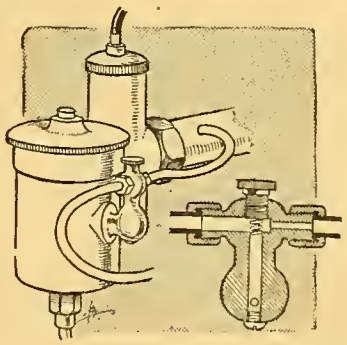
The Vacuum Co. have for many years very carefully studied the various qualities of oils and greases for motor cyclists. One of their latest innovations is a grease cartridge, which is illustrated herewith. It consists of a tin of grease, the top of which is provided with a shutter. When the latter is opened and the handle

turned, a steady stream of grease flows out, so that there is no waste, and the grease is handled in comparative cleanliness. The company also issue a special leaflet on motor cycle oils, and those interested would do well to write for a copy.

The Vacuum Oil Co., Ltd., Caxton House, Westminster, S.W.

Badcock's By-pass.

An effective little device for rendering more automatic the usual motor cycle carburetter is the Badcock by-pass, which



consists of a small pipe conveying small quantities of strong mixture into the inlet pipe for slow running. This comes into use when the throttle is shut. It has been on the market a considerable time, and is much appreciated by motor cyclists.

Mr. F. Badcock, 110, Woodville Road, Thornton Heath, Surrey.

Purcell's Sidecars.

A firm which has made a special study of the construction of sidecars is Messrs. Purcells. Particular attention has been paid to the strength and rigidity of the various models, and this has been accomplished by doubling the main tubes, which take a large proportion of the weight and are subjected to the greatest amount of vibration, by doing away with lugs and by welding all the joints, thus obtaining a neat appearance and rendering the chassis easy to clean. The axle is made of a special grade of steel, is of ample dimensions, and is welded into the axle tube. It is interesting to note that the quality of the material is such

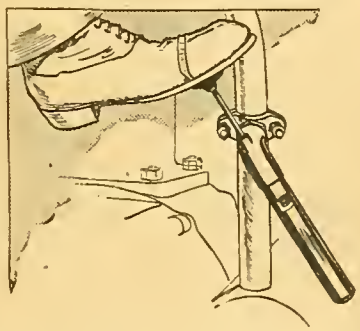
that the axle can be bent cold, so that a broken axle should be an impossibility. The hub embodies a special ball-retaining device, which enables the wheel to be detached instantly. The centre flange is provided with a special ring for excluding grit from the ball race. The springs are specially designed with long leaves so as to give the greatest amount of comfort, and are fitted in such a manner as to reduce the over-all width of the chassis by over two inches. Another noteworthy feature is the fixing of the mudguard to the inner side member, which is well valanced, and is attached to the chassis by means of strong tubular stays, welded throughout. This welding is carried out by the oxy-acetylene process. It is also interesting to note that the chassis is dropped, giving ample room for a low body position, thus ensuring comfort and a pleasing, graceful outline. Care has also been taken to ensure that the combined weight of sidecar body and passenger is correctly balanced over a line joining the axle and the rear fixing to the machine, thus relieving the front forks and the head of the motor cycle from unnecessary stresses.

Numerous models are built, but the type illustrated gives a very good idea of the substantial sidecar chassis, complete with luggage carrier, to which a luxurious body can be fitted. A speciality is also made of light chassis for use on motor bicycles of medium horse-power. On the road, riding in a Purcell sidecar is extremely comfortable and the springing is excellent.

Messrs. Purcells, Ltd., 78, Charlotte Street, Fitzroy Square, W.

The Garner Whistle.

One of the first whistles adapted to motor cycles was the Garner, a most efficient means of giving audible warning. It is designed to be attached to the



exhaust pipe of a motor cycle, and is operated by pressing a plunger with the foot

Messrs. Henry Garner, Ltd., 120, Alcester Road, Birmingham.

Belts and Fasteners.

For many years Stanley belts and fasteners have been exceedingly popular among motor cyclists. The belts are of exceedingly high quality and are largely used by numerous riders. The two types

of hook fasteners are well known and have already proved their worth, and so may be dismissed in a word.

Quite a useful innovation is the Stanley shield, designed especially for expanding pulleys, though equally efficient for fixed pulleys, which prevents the belt slipping as it passes round the pulley. Its use may be clearly seen in the accompanying

sketch. Another useful accessory is the Stanley spare link, which we also illustrate. It serves the purpose of shortening or tightening the belt when an adjustable pulley is used.

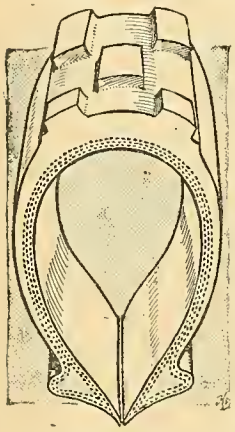
The Stanley Motor Belt and Fastener Co., 32, London Road, Bromley.

TYRES AND CLOTHING

S R J

Rom Tyres.

One of the best known non-skid tyres at present on the market is the Rom combination, which is so familiar to our readers that it needs but a passing reference here. The Rom rubber-studded cover is not, however, so well known as it deserves. It will be noticed from the accompanying illustration that the studs are square in shape, forming a rather uncommon pattern. The tyre is well built, and its wearing qualities are as satisfactory as its non-skidding qualities.



It is interesting to note that prices for Rom tyres for 1915 have been reduced; the same standard of quality is, of course, maintained. The rubber-studded cover to which we have referred above is sold at a very moderate figure.

The Rom Tyre and Rubber Co., Ltd., 36, Brooke Street, Holborn, E.C.

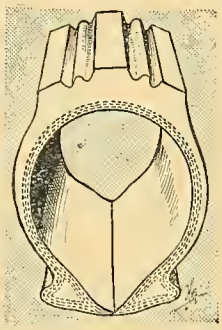
Quickly Detachable Leggings.

A very useful article at this time of the year, when there is much mud on the roads and rain in the air, is a pair of Brooks's motor cyclists' leggings. These are made with spring clips at the knee and ankle in such a manner that they can very easily be slipped on or off in a moment. When in position they afford excellent protection against the weather. The Brooks saddles are too well-known to need detailed description, but we may mention that B170 continues to be very popular amongst motor cyclists. The list of bags, luggage carriers, etc., is a long one.

Messrs. J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham.

Palatine Tyres.

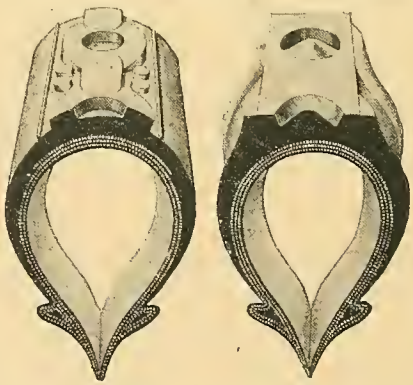
The manufacturers of the Palatine tyre hold the honour of being the first firm to allow a motor cycle cover to be submitted to a three thousand miles Auto Cycle Union official test. The tyre is strongly constructed and is built to wear, and it came through the above test, it may be remembered, with flying colours.



The Palatine Tyre Co., Ltd., Saul Street, Preston, Lancs.

Kempshall Tyres.

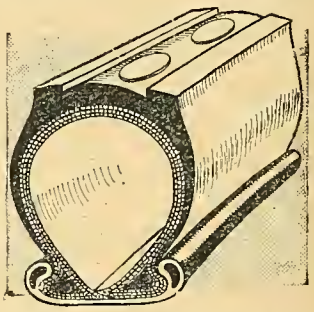
No alterations will be made in Kempshall tyres for 1915, the company pinning its faith to the models which have done so well during previous years. For four years in succession machines fitted with Kempshall tyres have been awarded the team prize in the A.C.U. Six Days trials, whilst this year the P. and M. team, fitted with Kempshalls, were only four points behind the winning team in these important trials, and in the Scottish trials the winning team of Indian machines was Kempshall equipped. It is also interesting to note that, in addition to having a record for reliability, the greatest speed ever attained by a motor cycle—93½ miles an hour—was made on Kempshalls. The two models illustrated are the non-skid and the anti-skid tyres, which are made in all popular sizes, including 2½in. to fit 2¼in. rims.



The Kempshall Tyre Co. of Europe, Ltd., 97-98, Long Acre, W.C.

A New Stepney Tyre.

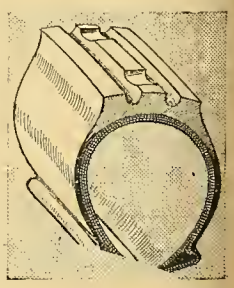
A new motor cycle tyre has been introduced by the Stepney Co., and it will be marketed for the coming season in addition to the well-known Road-grip cover. The new tyre is suitable for machines up to 3½ h.p., and is to be sold at a popular price. The makers claim that it combines the advantages of the three-ribbed tyre and the rubber-studded type. The ribs at each side provide the side grip, and the rubber studs in the centre give the necessary adhesion in a forward direction when driving. It is made of the best quality rubber and fabric obtainable. The Stepney Co. inform us that they are now supplying tyres for Auto-wheels, size $20 \times 1\frac{1}{2} \times 1\frac{3}{4}$ inches.



The Stepney Spare Motor Wheel, Ltd., Llanelly, South Wales.

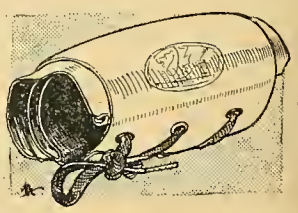
Bates Tyres.

A useful and durable tyre, made by Messrs. Bates and Co., is illustrated herewith. It will be noticed that it is of the three-ribbed variety, but differs from standard practice, in that it has indentations moulded at intervening spaces in the central rib.



A useful accessory made by this firm is a practical form of tyre gaiter, which the careful motor cyclist will find it convenient to carry in his outfit.

Messrs. Bates have also introduced a new motor cycle repair outfit, containing a small tin of specially prepared solution, as well as twelve patches, valve tubing,



French chalk, canvas, an indelible pencil, a tube of corned emery, a wire brush, and some insulating tape, so that there is little fear of a motor cyclist carrying one of these outfits being stranded.

Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester.

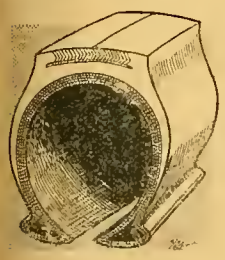
Skew Tyres.

We illustrate herewith the well-known Skew tyre, the tread of which consists of staggered indentations, moulded on its periphery. It will be noticed that the tread is square (round treads are also made), and it is a well made cover, strongly and soundly constructed, and is an efficient non-skid.

Messrs. Oylers, Ltd., 35, New Cavendish Street, Great Portland Street, W.

The Max Metallic Tyre.

Messrs. Chas. Cuthbe and Co. have introduced quite a new type of motor cycle cover, known as the Max Metallic Tyre. The tread is built up upon a brush-like material in which the metal bristles are attached to a specially prepared fabric base in such a manner that they cannot be dislodged. It is claimed that these bristles act as a non-skid. Certainly this type of tread should be useful in withstanding the onslaughts of nails and sharp flints. The highest grade of toughest Para rubber is forced hydraulically into this material, entirely saturating the fabric base and filling the spaces between the bristles.



Messrs. Chas. L. Cuthbe and Co., 37, Great Eastern Street, E.C.

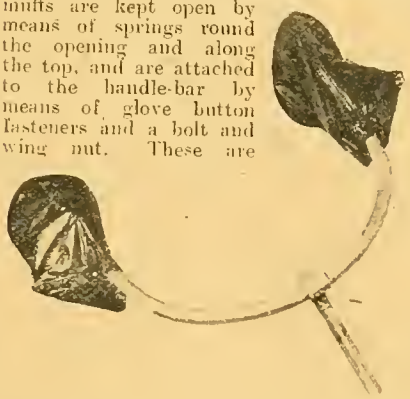
A Chest and Throat Protector.

The A.K. leather vest is a combination of waistcoat and throat protector. It can be worn in the house as a simple waistcoat, and when going out the neck attachment can be turned up and clipped into position at the back. It then affords ample protection against the weather.

The A.K. Manufacturing Co., 348, Idle Road, Bradford.

Handle-bar Muffs.

Among the many useful motor cycle accessories to be seen at Messrs. Selfridges, we would like to make special mention of a pair of handle-bar muffs, which are invaluable during cold weather. The exterior is made of waterproof material lined with warm cloth. The muffs are kept open by means of springs round the opening and along the top, and are attached to the handle-bar by means of glove button fasteners and a bolt and wing nut. These are naturally highly appreciated by motor cyclists who are serving their country both at home and abroad.



Messrs. Selfridge, Oxford Street, W.

Coats and Caps.

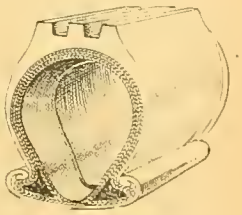
Among the numerous articles of apparel for motor cyclists to be found in the Service Company's showrooms we noticed a useful macintosh coat of a length sufficient to come below the rider's knees and lined with detachable fleece lining. It is sold complete with belt, and is, we understand, being supplied in considerable quantities to despatch riders.

Yet another article of interest to those who do much winter riding is the cap which we illustrate. Under normal conditions it looks just like an ordinary cap, but in very cold weather an inside lining, which is made of wool, may be pulled down; it then adequately protects the rider's ears from cold.

Service Co., Ltd., 292-293, High Holborn, W.C.

Reflex Clipper Tyres.

A high quality three-ribbed tyre which is well made and substantially constructed is the Reflex Clipper Ideal, the introduction of which should undoubtedly be welcomed by motor cyclists.



Another speciality of this firm, which, we understand, has been considerably improved for 1915, is the Clipper motor cycle belt, the prices of which have been considerably reduced.

The Clipper Tyre Co., Ltd., 52-60, Steelhouse Lane, Birmingham.

Detachable Endless Tube.

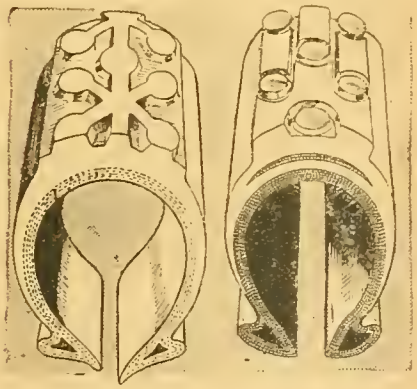
The Rich detachable air tube allows a free passage of air as it is not butt-ended. It was introduced for motor cycles as early as 1904 and is most successful. The firm also specialises in motor cycle covers.

The Rich Detachable Air Tube Co., Crawley, Sussex.

Clincher Tyres.

A tyre of interesting pattern recently brought out is the Clincher de Luxe. It is a substantial type, as the studs are joined by ribs, and should act as an efficient non skid until worn down, and the wearing should take a long time. The rubber has been changed from grey to a tough white quality, and has been improved in durability, the cross ribs between the studs giving larger wearing surface. It is made suitable for all types of machines.

Another novelty is the Clincher combination steel and rubber-studded tyre, which should prove an efficient non-skid under all road conditions. A special point is made of anchoring the studs securely, so that they will not pull out under ordinary usage. It is made suitable for voiturette rims.



The North British Rubber Co., Ltd., Clincher House, Great Portland Street, London, W

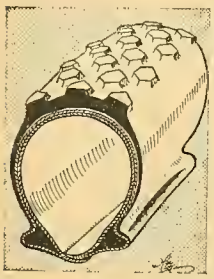
Beldam Tyres.

The peculiarity of the Beldam tyre is that the flexible rubber V's at the sides prevent not only circumferential slip but are claimed to prevent sideslip. The steel-studded tyre, it will be noticed, has the studs let in flush with the rubber.

The Beldam Tyre Co., Ltd., Beldam Works, Brentford, Middlesex.

Avon Tyres and Belts.

The Avon tyre is one which is exceedingly popular among motor cycle riders. The type of cover illustrated is known as the Druid, and it will be noted that the studs are of a somewhat peculiar pattern, being hexagonal in shape. Numerous other types of tyres are made by this firm, including three-ribbed, ordinary studded, the Sunstone special, the tread of which is flat and has transverse grooves moulded in it, and the combination cover, in which the steel studs are placed at intervals flush with the ribs.

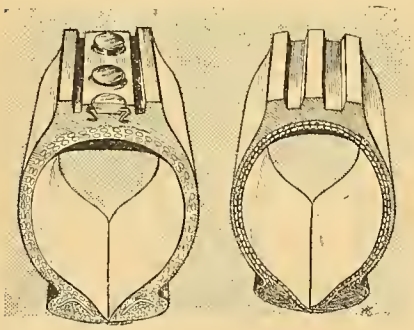


A reference to the new Avon belt was made in our issue of November 19th.

Avon India Rubber Co., Ltd., 19, Newman Street, Oxford Street, W.

A Steel-studded Palmer Tyre.

Few tyres have a greater reputation for durability than the Palmer. One of the innovations for 1915 is a new combination cover, which in outward design follows the three-ribbed pattern which the Palmer Co. has made so popular. It will be noticed that down the centre there runs a row of steel studs. Another interesting cover is the three-inch steel-studded Palmer Cord tyre, which is specially designed for use on heavy sidecar combinations. This has a square



steel-studded tread. The other patterns made by this firm are the three-ribbed tyre, which, we are told, has been greatly improved for the coming season, and covers made in two plies and four plies of fabric, which are suited for less strenuous work than that for which Palmer Cord tyres have been designed. These covers are also made in the 2½in. size to fit 2in. and 2¼in. rims. Although Palmer tyres have not been appreciably reduced in price, it may be pointed out that the tread of the three-ribbed tyre has been considerably increased in substance, and every endeavour has been made to keep up and even improve upon the present high quality.

Palmer Tyre Co., 119-123, Shaftesbury Avenue, W.

Tyres and Treads.

There will be two standard patterns for 1915, ribbed and studded. The prices of both tyres and treads have been reduced. Tyre repairs are a speciality.

The Fox Tyre Co., 30, John Bright Street, Birmingham.

Clothing.

Ever since the early days, John Piggott, Ltd., have made a careful study of the clothing wants of motor cyclists. One of the most serviceable motor cycling suits—that known as the J.P. Invincible—we have yet seen has been placed on the market by this firm. It is supplied with a good leather belt passing through straps at the back, so that the belt may be undone and yet be held in position. The material is thick and warm, practically untearable, and doubly proofed against wet. An excellent point is the extra thickness of material over the shoulders and the very sensible wind cuffs, which save wear, and keep the rider's arms warm. The buttons on these wind cuffs and also on the legs are of the spring type. The coat is of ample length, and if desired a seat may be fitted to the trousers at a slight extra cost. It will be noticed that the insides of the lower portion are provided with leather protectors, which are a great advantage. They prevent the cloth being worn through by contact with the sides of the footrests or any projecting part of the machine, and save the material in the case of the foot coming in contact with any part of the exhaust pipe. Straps of double thickness are sewn underneath the instep.

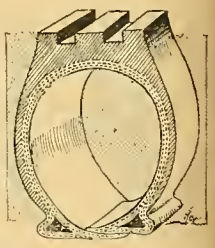
Messrs. Piggott make a feature of waterproof overalls, and we specially recall examining one suit of exceedingly durable material in khaki shade, and of a pattern which has been supplied to the Government.

A great point is also made of gloves, and we saw some excellent gloves made of real lambs' wool, which are specially suitable for winter riding.

Messrs. John Piggott, Ltd., 117, Cheapside, E.C.

Severn Tyres.

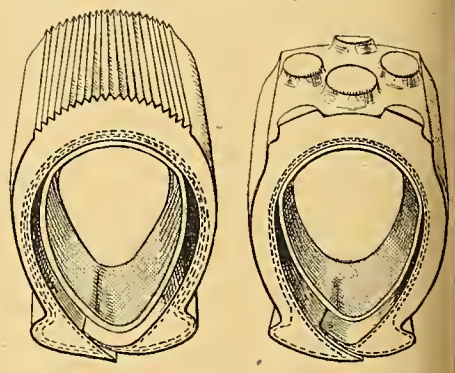
An excellent motor cycle cover of the popular three-ribbed tyre is the Severn. It will be seen from the illustration that it is chiefly conspicuous for the amount of rubber in the tread, which naturally greatly adds to its life.



Severn Rubber Co., Ltd., Newhall Street, Birmingham.

Wood-Milne Tyres.

The Wood-Milne range of motor cycle tyres is a wide one, and should meet the demand of all riders. It is difficult, with such a comprehensive list before one, to select any types for particular mention. The Wood-Milne "special" covers are fitted with three plies of canvas, and they are intended for fast work on medium weight machines, and for front wheel work on passenger machines. There are

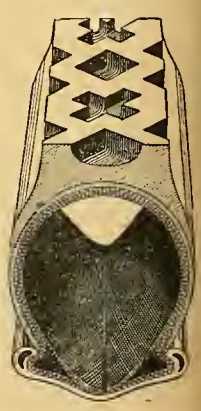


also the "extra strong" tyres with four plies of canvas, and the "new design" steel studded tyres, the last-named being intended for bad weather work. There is, of course, a range of inner tubes.

Messrs. Wood-Milne, Ltd., Preston.

A Suction Cup Tyre.

The Burnett non-skid tyre is made with a flat tread having V-shaped indentations on the edges and cups on the tread. This is claimed to be a most effective non-skid arrangement. These tyres are made with four-ply heavy motor canvas casing on the same system as the Burnett motor tyres.



The Burnett Motor Tyre and Rubber Co., Limpley Stoke, Wilts.

THE CALTHORPE

One, two, three—

three distinct Calthorpes offered in five different models. That's the Calthorpe proposition for 1915 — a proposition which has already strongly "caught on" — a proposition we invite YOU to investigate NOW.

And of course they're BRITISH—through and through.

Note carefully the illustrations — the neat and business-like design and pleasing proportions — then study a few details of their specifications — note the price, and say if better VALUE was ever offered.

One — The NEW "CALTHORPE JUNIOR" Motorcyclette. Price: 25 Guineas

— a considerably improved model of the popular "Calthorpe Junior" of last season. It embodies many added refinements — is speedy, exceptionally economical, and RELIABLE to the last degree.

SPECIFICATION :—*ENGINE—2 h.p., side-by-side valves, 2-speed gear integral with crank case, specially designed Silencer. FOOT BOARDS—Aluminium, special design. IGNITION—High Tension Magneto. FRAME—Very strong, complete with "DRUID" Patent Girder Spring Forks. WHEELS—26 × 2in. Moseley B.E. Studded Tyres. Complete with strong stand and Carrier, Pannier-bag, Toolkit, etc.*

Two — The "CALTHORPE-JAP." Price: 30 Gns. Single Speed, 25 Gns.

The "Calthorpe-Jap" is a higher-powered machine — particularly suitable for touring purposes — a perfect hill-climber, and listed at a popular price.

SPECIFICATION :— *ENGINE — 2¾ h.p., JAP, fast and powerful. GEAR—Enfield Patent Two-speed and Free Engine with Cush Sprocket. CARBURETTER—Senspray, 1915 pattern. IGNITION—High Tension Magneto. TRANSMISSION—Two roller chains to Countershaft, ⅜in. belt from Countershaft to back wheel. FORKS—"DRUID" Girder. WHEELS—26 × 2in. Moseley B.E. Studded Tyres. SADDLE—X'L ALL Pan Seat. Complete with armoured Pannier bags and full set of tools in Roll.*

Three—The "CALTHORPE 2-STROKE." Price: £28 10 0. Single Sp., 24 Gns.

A machine full of valuable features — designed and built to offer Calthorpe enthusiasts a perfected model of this particular type of machine.

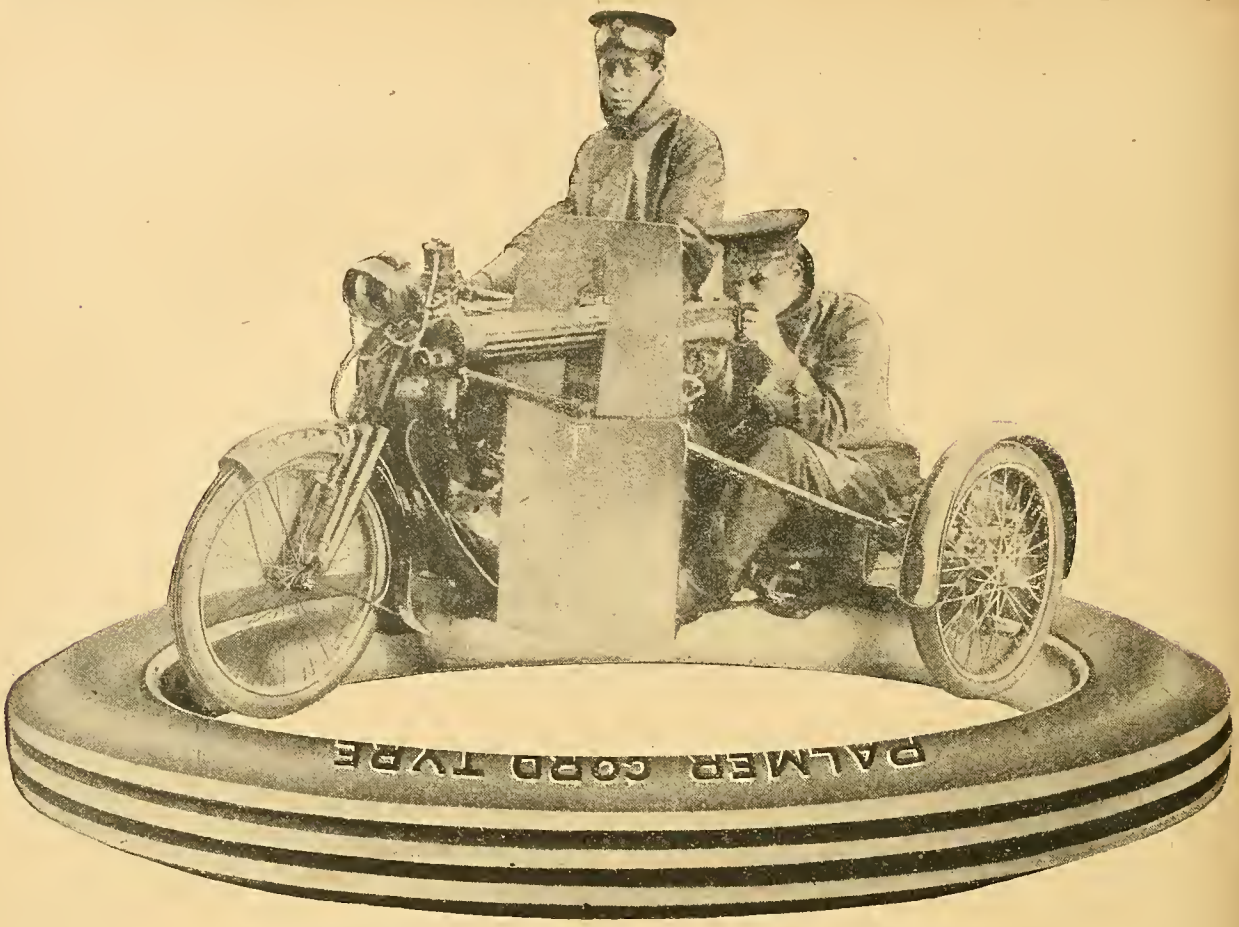
SPECIFICATION :—*ENGINE—2¾ h.p. LUBRICATION—Patent and perfected system. GEAR—Countershaft 2-speed, combination Belt and Chain Drive. CARBURETTER—Senspray, 1915 pattern. IGNITION—High Tension Magneto. FORKS—"DRUID" Patent Girder. WHEELS—26 × 2in. Moseley B.E. Studded Tyres. Complete with armoured Pannier bags, tools, etc.*

Now decide to ride a Calthorpe during 1915, and, as a first step, ask us for copy of the Calthorpe Catalogue — it deals fully with all models, and will be posted free on request.

The CALTHORPE MOTOR CYCLE CO.,
— BARN STREET, —
BIRMINGHAM.

FOR 1915

R.H.S.



Right Tyres for Strenuous Work.

Where true economy is the aim, or where life itself is dependent on reliability, then it has to be Palmer Cord Tyres.

The above illustrates the Scott Armoured Motor Cycle, fitted with 2½in. Palmers. This is the heaviest work to which Motor Cycle Tyres can be put, and it is quite in accordance with the fitness of things that the tyres that helped the Scott to score in days of peace should also help the Scott to fulfil its mission in times of war.

PALMER

(ORIGINATORS OF THE THREE-RIB TREAD)

CORD TYRES

THE PALMER TYRE, LTD
119, 121, 123, Shaftesbury Av.
LONDON, W.C.

Motor Cycle Tyre and Repair Dept.
103, St. John Street, Clerkenwell
London, E.C.

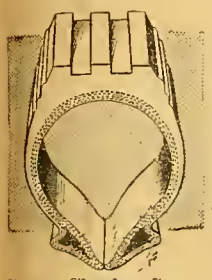
'Phone: City 1485 and 1486 (2 lines).
Telegrams: "Inwheeling, Smith, London."

c6

In answering this advertisement it is desirable to mention "The Motor Cycle."

Pedley Tyres.

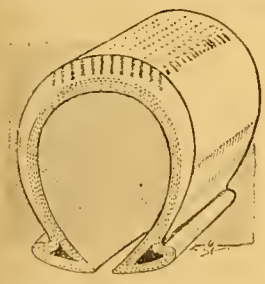
A three-ribbed cover, which is a great favourite, is the Pedley. We have had considerable experience with these tyres, and have found them to possess admirable wearing qualities. They are fast, resilient, excellent preventives of side slip, and by no means subject to cuts from flints.



Messrs. J. Pedley and Sons, Limited, Great Charles Street, Birmingham.

Stelastic Tyres.

Stelastic tyres are well-known to our readers. The accompanying illustration shows a section of the latest model round tread cover. Our readers will recollect that the Stelastic tread consists of upstanding spirals of fine piano wire, between which the rubber is



hydraulically pressed, thus rendering the most vulnerable portion of the tread impervious to cutting agents. It is interesting to note that Stelastic tyres have been considerably reduced in price.

Stelastic Tyres, Ltd., 76, York Street, Westminster, S.W.

Burberry Motor Cycle Kit.

Burberry's gabardine combines the power to resist the wet and afford comfort in a remarkable degree. The suit we illustrate has a jacket with a

triple front, lined with proofed wool. This with Burberry overalls and cap renders the rider practically independent of the weather.

Burberrys, Haymarket, W.

A Double-purpose Coat.

The Legxtenshun coat is a very practical garment, being a coat with overalls attached, which may be folded up out of the way when the machine is out of use. Often it is necessary to visit a neighbouring town and then to put the machine away and continue one's calls on foot. In such an event the Legxtenshun coat fills the bill splendidly, as, being a first-class article, it is of presentable appearance, and the folding overalls are quite unobtrusive.

Mr. T. W. Wareing, Gold Street, Northampton.

The Midland Tyre.

A tread with a central rib and a row of studs on either side, the pattern adopted by the Midland Rubber Co.,

should wear well and be an excellent preventive of side-slip.

Midland Rubber Co., Ryland Street, Birmingham.

A Sidecar Hood.

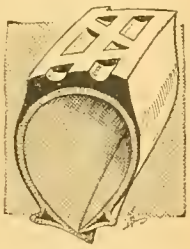
The Baby hood is designed to take the place of the more cumbersome and expen-

sive hood and screen, and at the same time to furnish ample protection for the sidecar passenger against the weather. When not in use it folds up into a flat cover and is fastened to the storm apron.

Mr. H. R. Starke-Jones, Park House, Halifax.

Spencer-Moulton Tyres

A most excellent cover, made by a firm which has had a great deal of experience in the manufacture of motor tyres, is the three-ribbed Spencer-Moulton. It is an excellent wearing and speedy tyre and an efficient non-skid. It is interesting to note that the three ribs are joined at intervals by diagonal cross bars. Owing to the ventilation of the tread offered by the grooves it is said to keep extremely cool, and the minimum amount of friction is set up.



Messrs. G. Spencer, Moulton and Co., Ltd., Kingston Mills, Bradford-on-Avon.

The Leicester Rubber Co.

The Leicester Rubber Co.'s productions and the John Bull motor cycle tyres are

well-known to our readers. These are being continued for next year, and we are informed that all prices have been reduced. A new cover is the 26in. × 2in. Granby, which has been designed for lightweights. It is a rubber-studded cover, and it has been well tested.

As a specimen of the clothing sold by the same company, we illustrate the new John Bull "trouser-alls." These, it will be noticed, are so arranged as to allow of them being taken off without slipping them over the boots—a point to be appreciated in winter weather. Like the John Bull tyres, the material is of excellent quality.

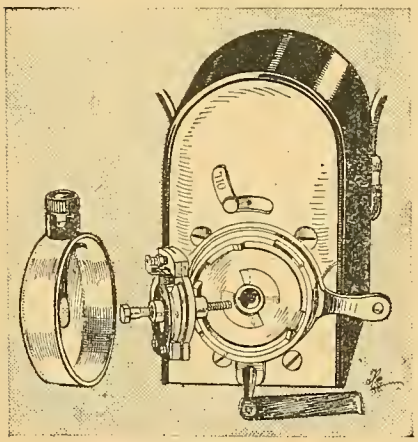
A storm proof suit and Sou'-wester

Leicester Rubber Co., Leicester.

Electrical Appliances

The Elkhart Magneto.

A magneto which makes its *début* into this country is the Elkhart, which hails from the U.S.A. In outward construction it follows accepted lines, but the contact-breaker which we illustrate herewith can be seen to be a slight departure from standard practice. The upper of the two platinum points is mounted on a spring parallel with the end plate of the magneto, which keeps it normally in engagement with the lower of the two platinum screws. On the end of it, adjacent to that portion to which the platinum point is fixed, is a fibre block, which as the contact-breaker is rotated, comes into contact with two cams on the back of the contact-breaker disc. The lower of the two platinum screws is fixed into a slotted plate, and through the end of the slot there is a screw next to the platinum point, the object of which is to tighten up the platinum screw so that the latter cannot work loose when once secured after adjustment. The method of attaching the high-tension



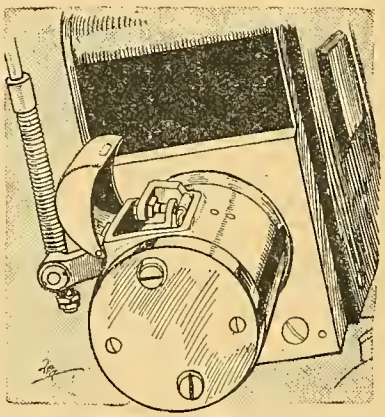
wire and carbon brush holder is also ingenious, the bared wire of the high-tension cable being pushed into the vulcanite holder and secured by a screw, the brass head of which makes contact with the carbon brush. Another interesting point is the neat lubricator through which oil is introduced to the armature bearings. These magnetos are made suitable for all types of engines, the particular type illustrated being suitable for machines with the cranks set at 180°, such as the Scott.

Another accessory sold by this firm is the Champion heavy stone sparking plug. It is made by a firm in America which manufactures 2,600 plugs per day, and it is sold at a moderate price. The chief points about the plug are the specially substantial insulator, which is made of stone, the strong electrodes, and the fact that the insulator is well hollowed at the base, thus preventing sooting.

Messrs. Morris, Russell and Co., 75, Curtain Road, E.C.

The Latest Dixie Magneto.

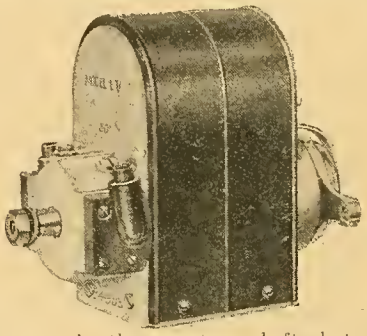
It was as recently as in our issue of September 17th that we described the interesting new Dixie magneto, for which this company are responsible. It is



Inspection cover for adjusting or examining the platinum points in the new Dixie magneto.

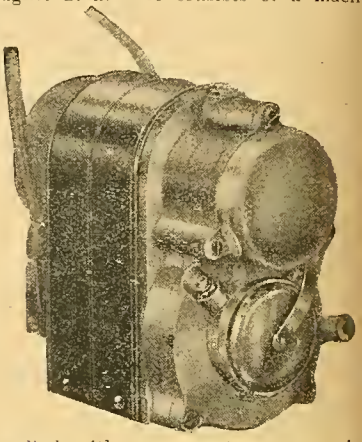
worthy of note that the latest type of Dixie magneto is fitted to the 1915 Indian models. The accompanying sketch shows the ingenious manner in which the platinum points can be reached for adjustment.

We make special reference to this pattern because it is a distinct departure from standard practice. What is in other



magnetos in the armature shaft, but in this case a rotor with staggered shoes, is placed in a line with the magnets, while the armature winding is above the rotor shoes. A full description of this interesting little magneto appeared on page 355 of *The Motor Cycle* of September 17th.

The combined dynamo and lighting set was described in detail in our issue of August 27th. It consists of a machine



supplied with two armatures, one above the other, of which the upper one is the generator for lighting purposes.

The Splitdorf Co. inform us that their factory in the States is turning out 800 magnetos a day, consequently there is no difficulty about delivery.

The Splitdorf Electrical Co., 162, Great Portland Street, W.

Hobson Plugs.

The accompanying sketch shows the latest type of mica-porcelain Hobson plug. The two parts are easily detachable. The upper portion is of the best mica and is practically unbreakable, and highly suitable for standing rough usage on motor bicycles. The lower portion, being of porcelain, can stand the great heat to which it is subjected and prevents sooting up.

Messrs. H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, S.W.

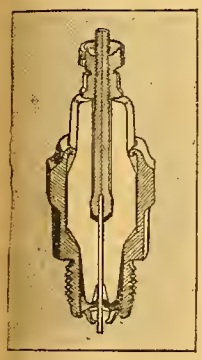
An Adjustable Spark-gap.

In our issue of September 1st we described the Runbaken sparking plug with adjustable gap. This has been considerably improved, and the alteration in design will be noticed in the top of the plug, which is now provided with the pointer showing the amount of spark gap between the two shoulders on the top of the insulator, while the bottom portion has also been changed in design. The central electrode sparks against the edge of a ring of nickel, the inner circle of which is cut eccentrically.

Mr. J. H. Runbaken, 7, Peters Street, Manchester.

The Oleo Plugs.

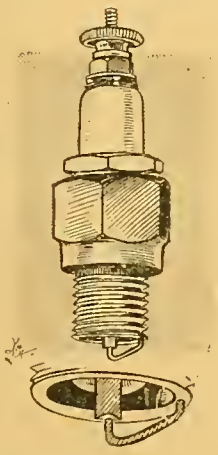
The accompanying sketch shows a section of the latest pattern of Oleo plug, which is used by the Governments of all the Allies. The chief points about its construction are the employment of a central electrode which is very thick towards the top, so that the heat is rapidly conducted away from the extremities thereof, and the use of a metal washer to make up for any unequal expansion of the porcelain through heat. The whole plug is beautifully made and highly popular among motorists of experience. Our own experience of the Oleo has been most satisfactory.



Leo. Ripault and Co., 64a, Poland Street, W.

Cup Detonating Plugs.

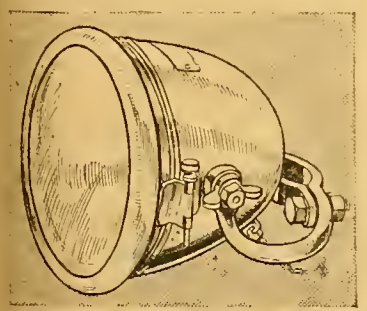
The latest form of Low cup plug for motor cycles has several advantages. The insulator is made of special material containing both asbestos and porcelain, thus possessing not only excellent insulating properties but the desired degree of toughness. The cup at the lower end of the central electrode has been carefully made so that the spark is thereby intensified.



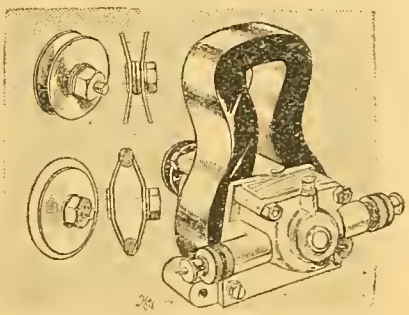
The Low Accessories Co., 15, Great St. Helens, E.C.

Mira Head Light and Dynamo.

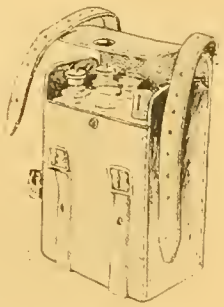
The Mira dynamo set, which consists of a head light, dynamo, and accumulator, in leather case, as illustrated, has been improved by the addition of a commutator, which converts the alternating current



generated by the dynamo into a continuous one so that it may be used for charging a six volt accumulator. Prevention of damage by allowing the accumulator to drive the dynamo after the machine has been brought to a standstill is effected by winding the armature with a somewhat thin wire, which has the effect of offering a resistance to the current, and unless the accumulator is left



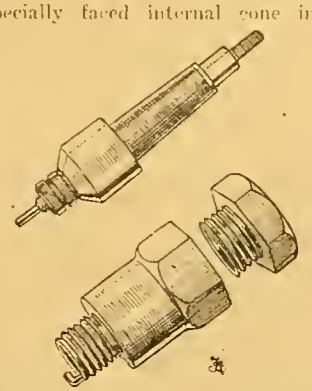
on for an appreciable time no harm will ensue, and then all that will happen is that the battery will run down. A three-way switch is provided to control the lighting and charging. The pulley on the new dynamo is adjustable and reversible. The two flanges can be separated by means of a washer or two and a lower gear obtained, or they may be inverted and a leather ring interposed between them, and they will act as an efficient friction wheel. The wiring is of good quality, and the head light is well made.



The High Tension Co., 62, Belvedere Road, Westminster, S.E.

A Plug with Removable Electrode.

The Electric Ignition Company have, in response to a large demand for an all-British sparking plug with a quickly detachable central electrode, produced a most serviceable plug. The central electrode is well insulated with mica, the central portion being strongly coated with steel and having a wide conical face, which, with the aid of a specially faced internal cone in the



body of the plug, forms an excellent compression joint. The central portion is held in position by a gland nut, which can be loosened or tightened with ease by an ordinary spanner.

Electric Ignition Co., Sampson Road North, Birmingham.

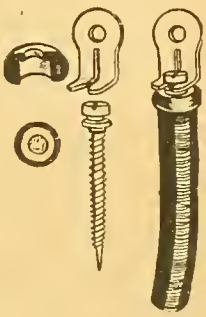
Lodge Plugs.

There is no better plug than the Lodge, and the pattern we illustrate, which, we understand, is largely used by despatch riders, is most suitable for use on motor cycles during the winter, as it is fitted with a weather-proof terminal, which can be instantly detached. Other patterns are also made, a recent model having mica insulation. With every plug a gauge for setting the points correctly is supplied.

The Lodge Sparking Plug Co., Ltd., Wrentham Street, Birmingham.

Amac Accessories.

In addition to the manufacture of carburetters, the Aston Motor Accessories Company has introduced an exceedingly neat, well-designed, and strong cut-out switch, operated by means of a push button. The nut which secures the cable can be placed on either side of the block so that the device may be used either on the inside or outside of the handle-bar.



Another useful electrical accessory made by this firm is a spring terminal clip, screwed on to the end of the sparking plug. The cable is bared for about three-eighths of an inch, and the strands are splayed over and the ebonite is slipped on. The point of the screw is inserted in the centre of the wire and then screwed home and the ends of the terminal are sprung into position.

The Aston Motor Accessories Co., Ltd., Aston Cross, Birmingham.

A Protected Terminal.

Among the many interesting accessories manufactured by Messrs. Bluemel, one of the neatest is known as the Shortproof terminal. It consists of an insulated cap, which can be easily attached to the high-tension wire, and slips over a special plug terminal, thus preventing the possibility of short circuits through rain or damp. The special plug terminal referred to is screwed internally to suit most standard plugs. Our illustration shows the terminal removed, and with it one of Bluemels' Mascot plugs. The firm's tyre pumps have a world-wide reputation, and their excellent workmanship is maintained in all their many productions.

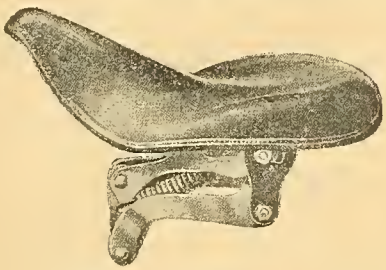
Bluemel Bros., Ltd., Wolston, near Coventry.

GENERAL ACCESSORIES.

(*Continued from page 645*).

Xl-All Saddles.

The Xl-All saddles and seats are noted for their extreme comfort and the excellence of their springing, which is on the cantilever principle, the tops being



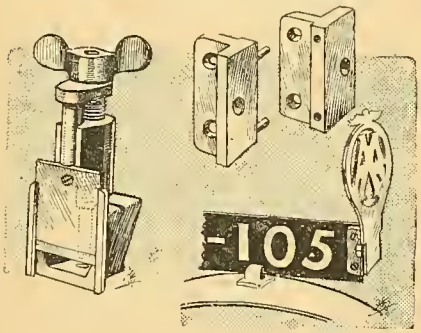
on anatomical lines. They can be supplied with saddle-pillar giving a very low saddle position.

Xl-All, Ltd., Hall Green, Birmingham.

P. and P. Belt Punch.

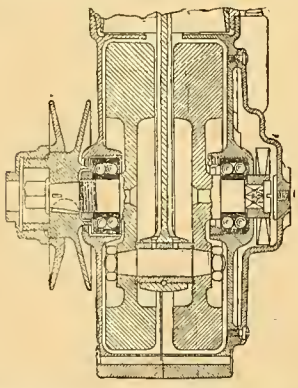
A firm which has been responsible for many ingenious accessories is the P. and P. Engineering Co. One of their latest introductions is a very neat badge clip, a sketch of which illustrates this article.

In the combined belt punch and cutter which the company have been marketing for some time the punch and screw are now made from solid steel, and are hollow so as to allow the punched por-



tion of the belt to pass through the screw and out of the top of the thumb screw. The tool is also sold in the form of a guillotine belt cutter without the punch.

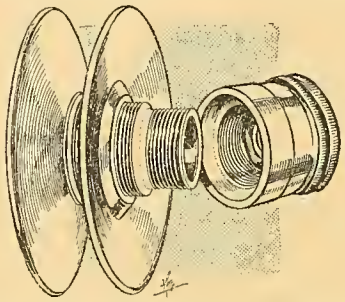
The P. and P. Engineering Co., Ltd., Roden Street, Ilford, E.



A Skefko double row ball bearing fitted to the crankshaft of a motor cycle engine.

The Lohr Pulley.

A simple adjustable pulley is the Lohr. The accompanying sketch will show the manner in which the flanges are mounted. A threaded boss is attached to the engine shaft, and on to the back of this a fixed flange is screwed. Next, the movable

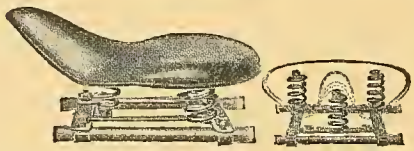


flange is screwed on to the front of the boss, and is possessed of a left-hand thread, while last of all the lock nut goes on, which has an ordinary right-hand thread.

Messrs. A. and E. Lower, 670, Seven Sisters Road, London, N.

A Comfortable Pillion Seat.

The Empire de Luxe saddles are the principal products of the Leatheries, but they make several other useful articles, and we show on this page a very neat

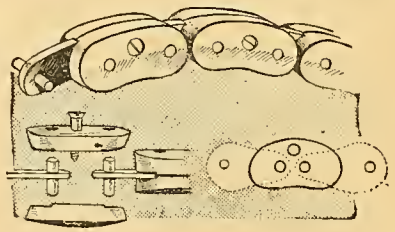


pillion seat, which is attached to the carrier by a strong base and three spiral springs.

The Leatheries, Ltd., Sampson Road North, Birmingham.

Whittle Belts.

A belt which is exceedingly popular among motor cyclists is the Whittle, which consists of leather links held together by means of wood screws against steel links; this is flexible, stretches very little, and wears well. It also possesses the advantage of having no belt fastener, since, to detach the belt, it is only necessary to remove one of the wood screws.

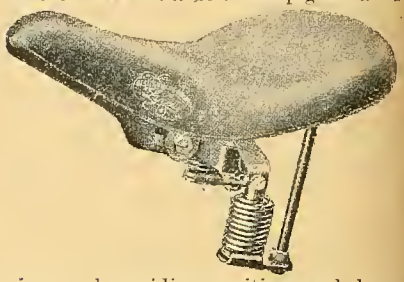


A short link is supplied for the purpose of taking up the belt. The belt also possesses the advantage of doing away with the necessity of carrying a complete spare belt, as, in the event of breakage, the insertion of a new link or a new section is all that need be done.

Messrs. T. Whittle and Sons, Warrington.

Lyco Saddles.

We illustrate herewith the No. 4 pan seat Lyco saddle. The seat is automatically shaped, having a stout metal base covered with felt and pig skin. It

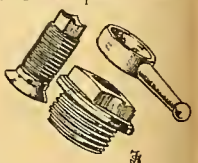


gives a low riding position, and has a machined adjustable clip. Other specialities of this firm are belts, tool bags, cases, etc.

Lycett's, The Saddlery, Birmingham.

A Neat Compression Tap.

It might be thought that designers had reached the limit of ingenuity with regard to compression taps. Yet a simple device has recently been produced by Rotherham and Sons which has many excellent features. It consists of a plain metal body, which is bored, and screwed left-handed. In the internal thread works a hollow spindle having a conical seating at the bottom, while

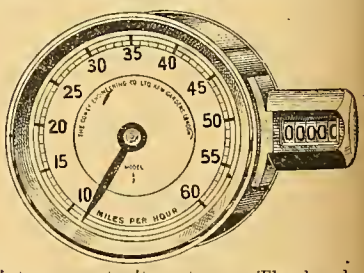


just above the seating are four small holes communicating with the central hole. When screwed up tight the conical face forms an effective valve, and is absolutely compression tight. Thus, not only are the injection holes cut off from the cylinder, and so prevented from carbonising up, but also a flat smooth surface is presented to the hot gases. A turn of the handle opens the valve and permits petrol or paraffin to be injected direct into the cylinder.

Messrs. Rotherham and Sons, Spon Street, Coventry.

The Cowey Speedometer.

The Cowey speedometer enjoys the distinction of being an instrument which works on a different principle from any other on the market. The principle of working is the rotation of a simple eccentric which causes impulses to a circular pendulum, carrying it to the position at which the invariable "return" force is balanced by the rapidity of the impulse which, having carried it to that

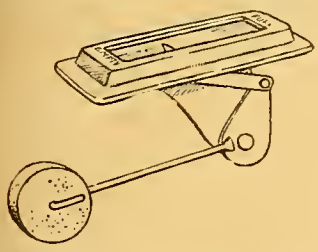


point, prevents its return. The hand on the dial only moves to indicate a change of speed, and is extremely steady.

The Cowey Engineering Co., Ltd., Archer Works, Kew Gardens, S.W.

A Petrol Gauge.

A clever little gauge has been produced by the Croft Engineering Co., which is so simple that our illustration is self-explanatory. The glass-topped dial plate is affixed to the top of the tank, and the cork float carried on the end of a light arm moves the indicator

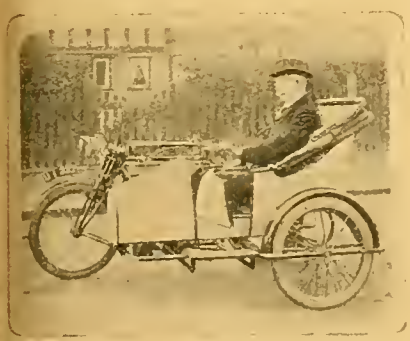


needle through simple mechanism. If necessary, graduations can be made on the dial, but as the variation of movement due to the angle of the pivoted arm is compensated by the toggle action such marks are hardly necessary.

The Croft Engineering Co., Croft Road, Coventry.

A Two-seated Sidecar.

Those sidecar riders who desire more comfort than the bicycle seat affords should make a point of seeing the U. and I. two-seated sidecar, which provides accommodation for the driver as well as the passenger. The handle-bar is replaced by a tiller, the saddle removed, and the brakes connected to pedals in the body. The carburetter controls are fitted to the tiller handle. The sidecar weighs 140 lb., and the width of the track is 42in. A

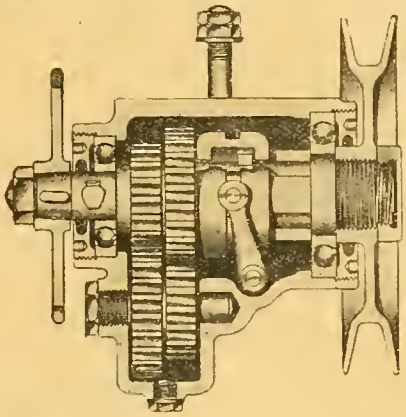


neat metal shield can be supplied to fit along the whole length of the tiller, thus giving the hands complete protection from the cold.

Mr. N. Barrett, King's Road, St. Albans, Herts.

Jardine Two-speed Gear.

The Jardine Mark 4 gear is somewhat similar in construction to the four-speed gear of the same make, described in our issue of October 8th. The construction and operation is as follows: The driven sprocket is attached to a main shaft, which carries the left-hand gear wheel and an enlargement having teeth formed on it, shown between the double clutch dogs. These latter slide on a splined sleeve which carries the belt pulley and revolve with it. The gear wheel shown on the right revolves freely upon the main shaft. The wheels on the layshaft are rigidly attached to one another. When the clutch is in the position shown the low gear is in operation, the drive being through all four gear wheels, but when the clutch is moved to the right the pulley is clutched to the main shaft through the teeth on the enlargement of the shaft and the splines, the wheels on the layshaft revolving idly. It will be observed that the gear wheels are always



in mesh. This gear is suitable for single-cylinder engines up to 350 c.c. and twins to 500 c.c. The gear ratios are 4¾ and 9½ to 1, a 50% reduction in speed.

Mr J. Jardine, Deering St., Nottingham.

The Bonniksen Speedometer.

The Isochronous Bonniksen speedometer differs from other instruments in having two hands and an escapement mechanism, which allows each hand in turn to register the speed for a period of five seconds. Thus it is very easy to observe acceleration. Also when each hand has taken up its position it remains absolutely steady even on rough roads

The latest pattern Bonniksen instrument—a most reliable speedometer, by the way—is provided with trip recorders in the centre of the dial, as shown in the illustration. The right-hand needle records miles, the left-hand needle tens of miles.

B. Bonniksen, 16, Norfolk Street, Coventry.

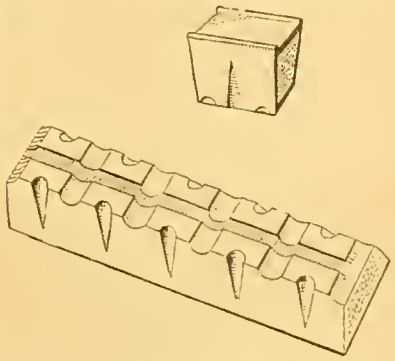
Stewart Magnetic Speedometers

One of the most deservedly popular speedometers on the market is the Stewart. It may be recollected that this works on the magnetic principle, and that the figures are printed actually on the magnetic cup, which is rotated by means of the eddy currents set up on the permanent magnet driven by the flexible shaft. We have tried one of these speedometers for a considerable distance and found it to be most efficient. It records the speeds accurately, is steady, and the figures can be read at a glance.

The Cooper-Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, W.C.

The New Avon Belt.

An outstanding feature of the Avon 1915 programme is the new design of rubber belt. The first thing to attract attention is the design of the top, which is channelled, the makers claiming that such a construction allows rain to drain off beyond the pulley much more readily than the usual belt design. For this reason the makers call it the "Watershed" top. Another interesting point is the use of grooves at the sides and base of the belt, the object being to allow for displacement of the rubber when working round the small pulley. Great trouble



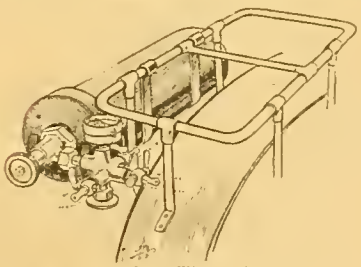
has been taken in arriving at the correct shape for the indentations and their location. The vertical grooves narrowing from the base upwards alternate with transverse grooves on the base at right angles to a central circumferential channel.

The prices of the new Avon belt are as follow: ¾in., 1s. 6d. per foot; ⅞in., 1s. 9d. per foot; 1in., 2s. per foot; 1⅛in., 2s. 6d. per foot.

Avon Indiarubber Co., Ltd., Melksham, Wilts.

D.A. Cylinders.

The cleanliness, convenience, and practicability of dissolved acetylene are already beginning to be appreciated by motor cyclists. A difficulty, however, is the carrying of the cylinder in a convenient place, especially on solo machines. An attempt to find a solution has, how-



ever, been made. The cylinder is carried in a metal case with a leather end, and can be clipped to either side of the luggage carrier or to the back thereof.

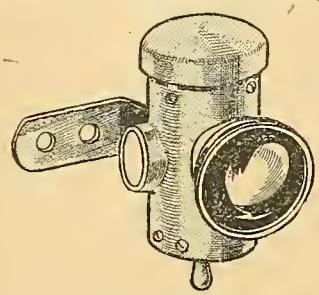
A further improvement has been made by the addition of a reducing valve fitted with three separate taps and a gauge from which pipes may be led to the head light, tail lamp, and sidecar lamp.

It may be mentioned that the standard cylinder is 12in. long by 3½in. in diameter, weighs 6 lb., and holds six cubic feet of gas, giving light for a seven litre burner for twenty-four hours.

Acetylene Illuminating Co., Ltd., 268, South Lambeth Road, London, S.W.

A Rear Lamp.

One of the latest novelties to be found among the interesting display of accessories sold by Messrs. Dunhills is a very neatly designed metal tail lamp, which is intended to be attached to the bodywork

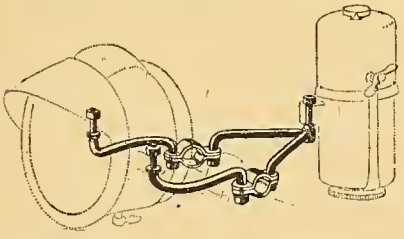


of a sidecar. The finish is dull black and is certainly attractive.

Messrs. Dunhills, Ltd., 359-361, Euston Road, N.W.

A Neat Adjustable Lamp Bracket.

The accompanying sketch shows an ingenious form of lamp bracket made by Brown Bros. It possesses the advantage of being universally adjustable, and capable of being made to suit any form

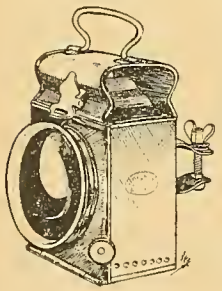


of handle-bar, while it also provides a support for the generator. The bracket is well-made, and is certainly a most useful accessory.

Messrs. Brown Bros., Ltd., 22, Great Eastern Street, E.C.

An Oil Lamp for Sidecars.

There has always been a demand for a good oil rear lamp for the sidecar combination, and such has been brought out by Messrs. A. W. Gamage. It is a strong, well made article, designed to be fastened direct to the tubing of the luggage carrier.



Messrs. A. W. Gamage, Ltd., Holborn, E.C.

A Small and Neat Tail Lamp.

A visit to the Service Co.'s showrooms in High Holborn reveals several useful accessories. One of these is the smallest electric rear light on the market, which is designed to be screwed into the number

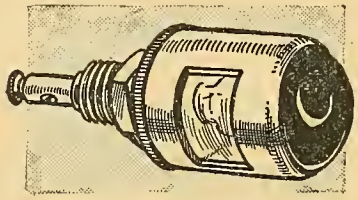


plate of a sidecar combination. It is illustrated in the accompanying sketch, which clearly shows its neat and compact construction.

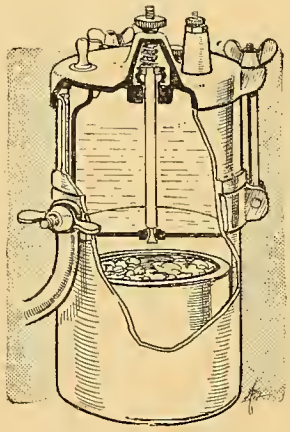
The Service Co., 292, High Holborn, E.C.

A Novel Generator.

It was in our issue of October 8th that we described the new Low generator, and in that description it may be remembered it was mentioned that the particular model described was suitable for small cars. We are now enabled to illustrate the latest type, suitable for motor cycles. This is in height about the same as an ordinary generator, but slightly wider. Considerable improvement has been brought about by placing the filler cap

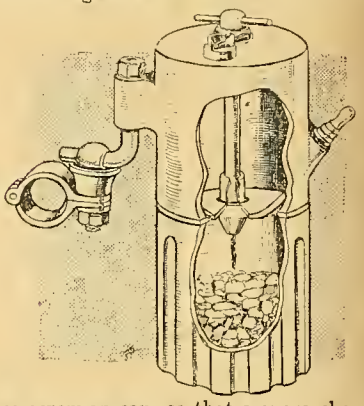


on the top of the water tank, whereas in previous models it was at the bottom. Other details in design have been considerably improved. The generator is constructed to go on to brackets made by several of the best-known manufacturers of motor cycle lamps.

The Low Accessories Co., 15, Great St. Helens, E.C.

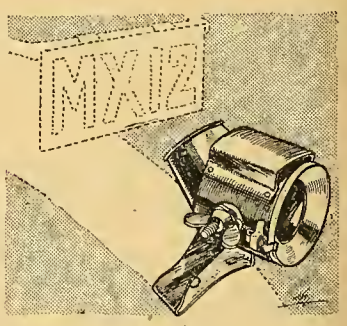
Lamps and Generators.

We illustrate herewith the latest form of Smith's A.L. generator. It is constructed on the drip feed principle, water being introduced through a needle valve and dripping down a short chain on to the carbide. The outer casing is made of aluminium so as to ensure lightness. An interesting feature is the spare carbide container, which can be obtained with each generator. It is fitted with a



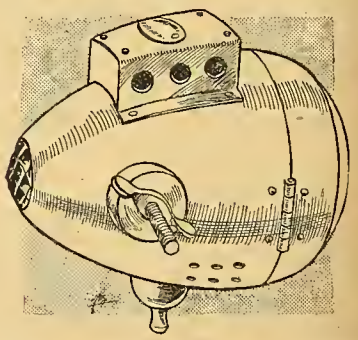
brass screw-on cap, so that a spare charge may be carried on the machine and when required screwed straight in position after the cap or cover has been removed.

Another novelty which is sold by this firm is a motor cycle tail lamp constructed to fit on to the mudguard. It



is supplied with a red glass at the back, while at the other end there is a transparent glass set at an angle suitable for illuminating the number plate. The lamp is finished in black.

We also show a sketch of a sidecar lamp of neat design. It is intended to

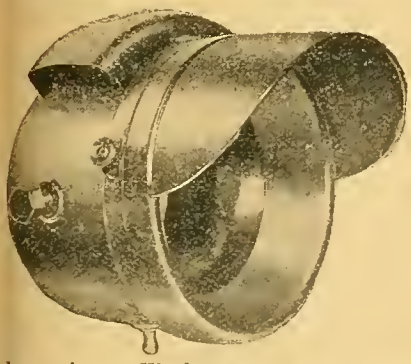


throw a wide beam so as to illuminate hedges and corners, etc., and has a red light at the back.

Messrs. S. Smith and Sons, Ltd., 179-185, Great Portland St., W.

Bleriot Lamps.

Although the well-known motor car lamp manufacturers, Messrs. Blériot, Ltd., entered into the motor cycle industry at a somewhat late period, they succeeded in bringing out a most efficient motor cycle head light. It is made of solid brass, nickel plated, and has a Bausch and Lomb



lens mirror. We have put one of these lamps to a strenuous test, and found it to give an excellent light, and to be extremely durable.

Messrs. Blériot, Ltd., Blériot House, Long Acre, W.C.

The Cox-Walker Electric Lamp.

The accompanying illustrations show the complete range of lamps sold by Messrs. Cox-Walkers, Limited. The most conspicuous features are the excellent finish and substantial construction, enabling them to be capable of standing the rough usage likely to be encountered on a motor cycle.

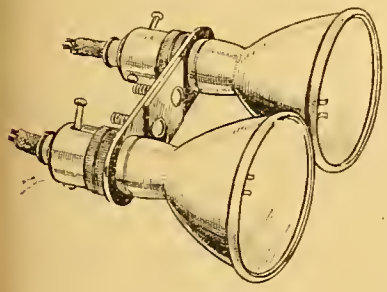


Fig. 1.

The pair of powerful head lights shown in fig. 1 are of a pattern used with great success by Mr. Harold Karslake. They may be used either off accumulators or dry batteries, and are so arranged that both head lights may be in use simultaneously or only one, according to the will of the rider, owing to the convenient arrangement of the switches in the bulb holder of each lamp. It is in the switch that a considerable improvement has been recently made in these lamps, as this is now of the push type, and working on the same principle as the pear-shaped switch so satisfactory in household use at the present time. The bell of the lamps is carefully silvered inside and constitutes a convenient form of parabolic reflector, while if attention is paid to fig. 3, showing the tail lamp for sidecar use, it will be seen that a straight bell is used, this being also a convenient form for the steering column lamp for a small car, which, though it gives a somewhat restricted light, yet gives adequate illumination for the instruments on the dashboard.

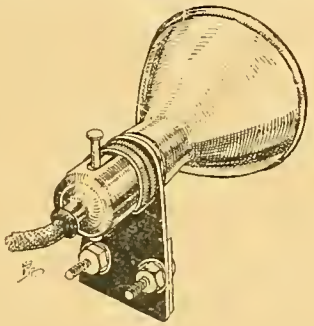

Fig. 2.

Fig. 2 shows the side light for a car.

A convenient feature is that the lenses of the lamps are now detachable, which, in the event of a glass being broken, allows of easy replacement. Standard makes are fitted with four-volt bulbs, but bulbs of higher voltage can be fitted if desired.

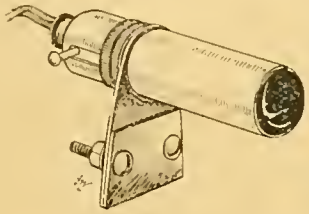

Fig. 3.

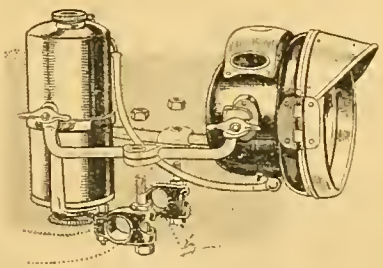
We have been using a Cox-Walker steering column lamp for a considerable time, and have found it to be excellent in every respect.

Cox-Walkers, Ltd., North Eastern Electric Works, Darlington.

Lucas Electric and Acetylene Lamps.

The products of no firm of lamp manufacturers have a better reputation for durability and super-excellence of workmanship than those of Messrs. Joseph Lucas, Ltd. With regard to their acetylene lamps, we illustrate herewith the latest type, which is equipped with a combination bracket, which may be lifted



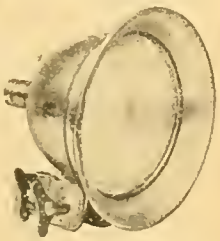
from the handle-bar with lamp and generator complete merely by undoing two nuts and leaving the bolts and brackets in position on the handle-bars.

We are also in receipt of an advance copy of Messrs. Lucas's catalogue of their dynamo lighting set for motor cycles and sidecar combination. This catalogue makes most interesting reading, giving, as it does, various examples of machines equipped with the outfit, instructions for use, and a diagram of wiring, which latter is, of course, invaluable to the user. It also shows the method of driving the dynamo on various models, such as the A.J.S., which is driven off the engine-shaft; the James, which is driven off the gearshaft; and the 6 h.p. Enfield, which is also driven off the engine-shaft.

Messrs. Joseph Lucas, Ltd., Birmingham.

Ward and Goldstone Lamps.

The accessory for which Messrs. Ward and Goldstone are best known is the Voltalite electric lighting outfit, a small dynamo driven off the rim of the front wheel of a motor cycle which lights the head light direct. The makers point out the advantages of this lighting installation to military riders, since, if a spare bulb is carried, the motor cyclist is independent of oil or carbide. In ordinary use a bulb is expected to last about twelve months.



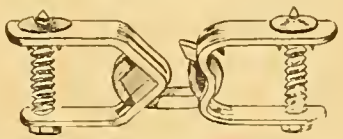
Another useful accessory is a motor cycle handle-bar inspection lamp. The lantern is on a ball joint and can be turned in any direction, and on occasions may even be used as a small head light.

A lesser known accessory sold by this firm is the Volex Giant battery, which will light a four volt metallic filament bulb for about eighty hours. Two of these batteries are said to last a motor cyclist twelve months. The company supply a special head light fitted with a metallic filament bulb for use with this battery. The battery possesses the advantage of being a quarter of the weight of an accumulator of equal capacity.

Ward and Goldstone, Sampson Works, Salford, Manchester.

The Star Belt Fastener.

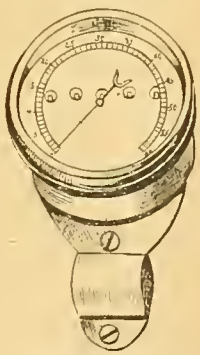
One of the strongest and most reliable fasteners on the market is the Star. It



is substantially made, and it will be noted from the illustration that the screw is inserted from the underside, and a circular nut with prongs ensures a good grip of the belt. The fastener is of the hook type, and there are no flimsy parts.

The Star costs 9d., but the Blake fastener on the same lines costs 6d. only.

Mr. Stanley T. Robson, 59, Hobmoor Road, Small Heath, Birmingham.



The Stewart magnetic type speedometer referred to on page 653

MILITARY NOTES.

Military Honour for a Motor Cyclist.

The first motor cyclist to be honoured by the King is Corporal B. J. Hallowes, R.E. The French "medal for valour," which he is shown wearing in our illustration, was handed to the King by the Prince of Wales, and then pinned by His Majesty himself on Hallowes's tunic. This incident occurred at the Front the other day during the King's visit to his troops. Hallowes, who is a Streatham man, was home on leave for three days during last week, and he had only just received his decoration. The blue and white bands on the hero's arm denote that he belongs to a signal section.

Corporal B. J. Hallowes, R.E., wearing the French medal for valour. Note the armlets (which are coloured) denoting that he belongs to a signal section.

A Message from the High Seas.

Rear-Admiral Sir R. K. Arbuthnot, writing from somewhere on the High Seas, says: "I have my Douglas at home, but still have the Triumph to gaze at and wonder if I shall ever ride it again. . . . I read *The Motor Cycle*, which still comes regularly." Sir R. K. Arbuthnot, Bt., on many occasions has said that motor cycle riding is the finest training a naval officer can have. Certainly the indulgence in the pastime steadies a man's nerves, and makes him quick in action and resourceful in times of danger.

The Sidecar Machine Gun Battery.

At the time of going to press there were ten vacancies in the 5th Motor Machine Gun Battery, details of whose equipment were given in our last issue. Experienced sidecar drivers, having good eyesight, who are free to commence training with a quick-firing gun, should apply at once to Mr. Geoffrey Smith, 19, Hertford Street, Coventry, stating age and experience. The pay is 1s. 2½d. per day, *plus* 6d. per day after passing the gun test.

Enfield sidecars of 6 h.p. have been allotted to the 5th Battery, most of the motor cyclists attached to which have been recruited from the Coventry district.

These machines are now being delivered. In the Royal Enfield design provision is made for carrying 1,000 rounds of ammunition, and the gun may be turned to fire at any angle. Moreover, we have seen it removed completely from the chassis and mounted on its tripod in less than half a minute, and re-mounted in the same short period of time.

More Despatch Riders Wanted.

Captain Fladen, Signal Company, Div. Engineers, Duke of York's Headquarters, Chelsea, informs us that he has vacancies for six more motor cycle despatch riders. Applicants should be expert riders, and have some experience of map reading.

The Bristol Motor Cyclists' War Committee, Queen's Hotel, Clifton, Bristol, informs us that more military motor cyclists are urgently needed, and those who apply with suitable machines will very shortly have positions found for them.

A Well-known Rider in a New Role

Mr. H. P. White, who was instrumental in introducing the preparation known as Motiphos for dressing clutch leathers, has received an interesting postcard from W. Pratt, the well-known competition rider. Pratt writes as follows: "I am taking the opportunity to drop you a line. I have been travelling in a railway truck for the last two days to this place for my captain at the front. I have had some very exciting times, as I have been in the thickest part of the fighting for the last month. I was in a town last week for two nights, and we had 157 shells arrive from the Germans. I am glad to say I got out alive, although I was next to a house which received two shells. I had a narrow squeak two weeks ago; a piece of a shell went right through my pocket and cigarette case, which practically saved my life. I am driving a Maudslay, and am kept very busy taking ammunition to my battery. I am keeping very fit, but it is very cold here."

Graham Price, of Catford, a prominent Bat and P.V. rider, has recently joined the Public Schools Battalion as a despatch rider.

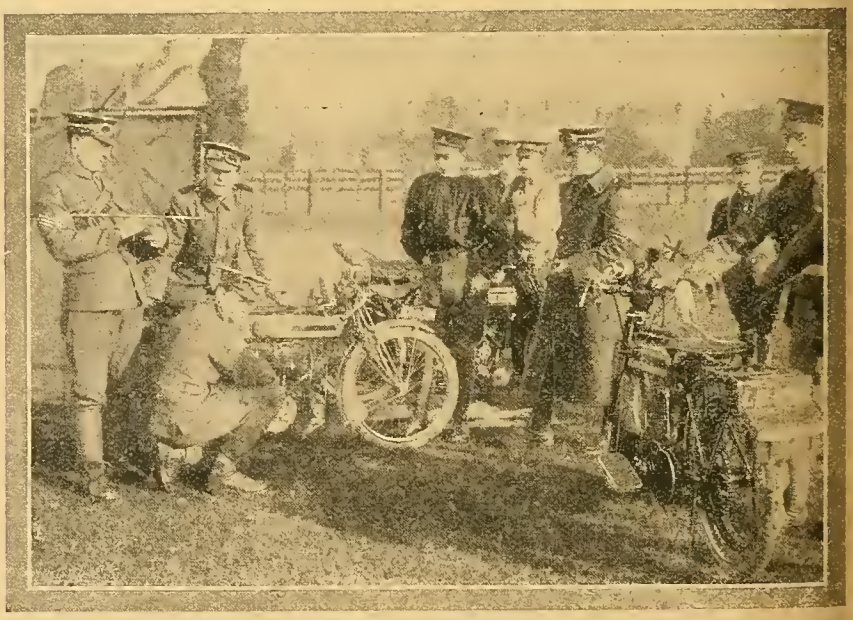
Messrs. S. Smith and Sons inform us that their Roll of Honour now numbers forty men at the Front and in training. One of their members, who holds a commission of second lieutenant, went through the bombardment of Antwerp and duly escaped, while one of their best hands in the speedometer factory was wounded at Mons and is now in hospital.

Messrs. Brown and Barlow, Ltd., makers of the B. and B. carburetter, have sent out 25,000 cigarettes for the benefit of the motor cycle despatch riders on active service.

Frank Philipp, the well-known Scott exponent, now holds the rank of acting sergeant, and spends his time in instructing novices in the handling of Scott-Maxim sidecar combinations.

A Woodgate and C. Allison (late of the Colmore Depot) are attached to the new motor machine gun batteries. Allison is a sergeant-instructor with the Scott sidecar maxims, whilst Woodgate is a repairer on one of the cars fitted up as workshops and attached to each battery.

Messrs. Chater-Lea, Ltd., it is interesting to note, are at present engaged in manufacturing equine accessories in the shape of taps for threading the holes for the "roughs," which are screwed into the horses' shoes to prevent them from slipping on frosty roads.



Motor cyclists who have enlisted in the new sidecar machine gun batteries in training at Wembley. Many of the Scotts have already been delivered, and the Enfields are now practically ready.

TWO NEW BRITISH MAGNETOS.

The Products of the Cicoy and Stentophone Companies.

ALTHOUGH the Cicoy Magneto Co., of 259, Goswell Road, has only been established seven weeks, it has already begun to turn out magnetos which are entirely made in its own factory, and hopes by the beginning of next year to be in a position to manufacture 100 weekly.

We recently saw the magnetos in various stages of their construction, and can assure our readers that the workmanship is good throughout.

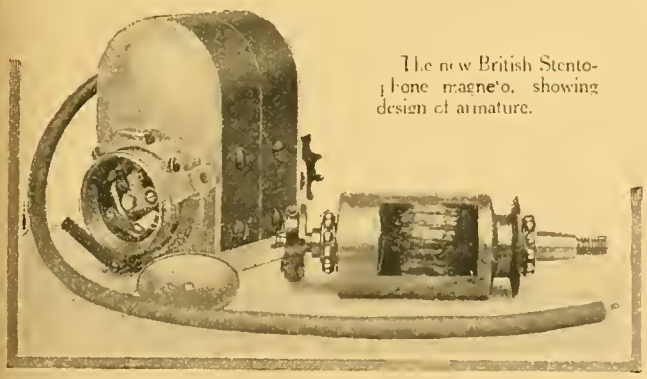
As regards design, we can only say that it closely resembles the lines followed by other well-known makes. The chief departure from standard is in the high tension terminal. The end of the h.t. wire is sweated into a brass socket; this is pushed into a vulcanite end which is provided with a spring socket, so that it may be clipped on the tapered brush holder, the whole forming a neat and entirely waterproof joint.

Parts of and a complete Cicoy motor cycle magneto.

It is interesting to note that the first magnetos manufactured by this firm are of the motor cycle waterproof type. They are being made for all types of motor cycle engines.

The Stentophone Magneto.

A company has been formed to take over the Price Magneto Co. This will be known as the Stentophone Magneto Works, Ltd., and will occupy works at 61, Vincent Parade, Balsall Heath, Birmingham, where several models will be made, which are designed on standard lines and interchangeable with existing Bosch types. These include several interesting and important features, among which may be mentioned the double wound laminated armature, which is subjected to a special treatment to prevent damage from moisture. The magneto is well enclosed, and as the aluminium end plates are cast the full width of the magnets a wide joint surface is available. The contact breaker is of the Bosch type, and substantial adjusting nuts are fitted. The high-tension terminal is absolutely waterproof, and can be fitted on either end of the magneto, while easy access to the carbon pencil is arranged. The condenser is contained in the end of the armature, and rotates with it on ball bearings. All types of motor cycles are catered for from the lightweight to the big twin, and all magnetos are subjected to a severe test before leaving the works, each instrument being run up to 5,000 r.p.m.



The new British Stentophone magneto, showing design of armature.

A Patriotic Club.

Bristol M.C.C. Dinner. A Splendid War Fund Donation.

THE Bristol M.C.C. held its annual dinner and prize giving on Saturday last, December 5th, at which there were nearly fifty present. Considering that about 30% of the club's members are on active service, a bigger muster could not be expected.

The president, Mr. Roderick Fry, was in the chair, and he made the presentation of prizes won by the members during the past season. A welcome visitor was George Brough, the only gold medal winner in the club's recent open eighteen hour trial. A silver cup was presented to Brough by a few of the members as some slight recognition of and admiration for his wonderful performance in such a severe trial. It will be recalled that the only other award was a silver medal to A. Ludlow Clayden (10 h.p. A.C. light car).

A magnificent collection of £30 0s. was made at the dinner for one of the war funds, and the president decided that this should be sent to *The Motor Cycle* for this journal to send to the *Weekly Despatch* for that paper's tobacco fund. Bearing in mind that the Bristol M.C.C. has already given £10 10s. to the Princess Mary's Fund, and is also awarding the surplus left over the recent eighteen hour trial, this further amount of £30 0s. speaks well for the generosity of the club.

A New Year Trial to Land's End and Back.

The club has decided, we understand, to run the annual twenty-four hours' run to Land's End and back on Friday and Saturday, January 1st and 2nd, 1915.

The club is losing its honorary secretary, Mr. Philip Grout, the founder of the club, and who has been honorary secretary since its formation in 1911. His place will be difficult to fill, because a harder working and more enthusiastic club official it would be difficult to find. The club itself is in a very healthy condition. Finances are good, and promises for the future are bright. There is to be a new executive.

New Models in this Issue.

We describe and illustrate in this issue the new O.K. two-stroke—a new departure for the firm of Humphries and Dawes—the 1915 sporting model 2¾ h.p. A.J.S. and 6 h.p. A.J.S. with sloping top tube, ladies' and men's new Velocette, the extremely novel twin-cylinder two-stroke Premier, the 1915 Wolf, and the two-stroke Allon.

In addition, two new British-made magnetos are described.

British Exports Increase in War Time.

Exports of British-made motor cycles in November actually increased from £87,549 in 1913 to £95,233 this year. This is the finest tribute possible to the efficiency of the British Navy. Just imagine record exports during war-time! It will reflect throughout the world the normal state of the country, and particularly the motor cycle industry. The imports of foreign-made motor cycles are, of course, considerably down, and are, indeed, but a fraction of what they were. The import and export figures for the month of November, and also the figures for the eleven months ending November 30th, are given hereunder :

VALUE OF MOTOR CYCLES AND PARTS THEREOF.

	Nov., 1912.	Nov., 1913.	Nov., 1914
	£	£	£
Exports ...	79,880	87,549	95,233
Imports ...	14,428	27,916	2,103

MOTOR CYCLES AND PARTS THEREOF FOR ELEVEN MONTHS ENDING NOVEMBER 30TH.

	1912.	1913.	1914.
	£	£	£
Exports	651,945	908,193	1.094,769
Imports	187,846	241,650	183.351

The Overseas Market for Motor Cycles.

Another reason for the increase in the exports of British-made motor cycles is that manufacturers at home are at last paying attention to the special requirements of motor cyclists Overseas. *The Motor Cycle* has consistently urged the immense possibilities for the British motor cycle in our Colonies and Overseas Dominions, and a monthly Overseas Supplement has been issued with this journal since the beginning of the year. During the eleven months of the present year, and despite the fact that the war affected the Overseas market during August in particular, over a million pounds worth of British-made motor cycles have been shipped abroad.

Continuous High Speed in America.

In a three hundred mile race at Savannah, U.S.A., at the end of last month, the winner, who was mounted on an Indian machine, covered the distance in 5h. 2m. 32s. This equals an average speed of practically sixty miles an hour. The course was 11.25 miles to a lap over good roads.

Increase in Motor Cycle Tyre Exports.

The war has no doubt been the cause of British exports of tyres and tubes for motor cycles increasing from £4,186 to £7,047 during November, 1913, and November, 1914, respectively. Germany enjoyed a large export trade in tyres prior to the war. In the eleven complete months of this year our motor cycle tyre export trade equalled £63,631.

Despatch Riders at Home.

Owing to increased facilities for leave, many motor-cyclist despatch riders, who went out to the Front in August, are already home from the Front for a week. Several well-known Coventry men are once again in the city of motors, and we have just heard of another batch arriving at Folkestone, after having come sixty miles across France in a motor 'bus.

Sidecars for Despatch Riders.

This week we make the suggestion that the War Office authorities utilise up-to-date sidecar outfits for the use of despatch riders during the winter campaign. It is well known that the roads are very soft and badly cut up by the heavy transport, and sidecars would therefore well fill the bill during the winter months, on account of their two tracks, and consequent stability.

Purley and District M.C.C.

At the annual general meeting last week it was decided that all present members serving in His Majesty's Forces, or who may hereafter enlist, be made honorary members for next year.

Lightweights for Despatch Riders.

It is not unlikely that lightweight machines will be tried by the War Office for the work of despatch riders during the winter campaign. There is no doubt that they would score on rain-soddened by-roads on account of their handiness, light weight, and extreme mobility.

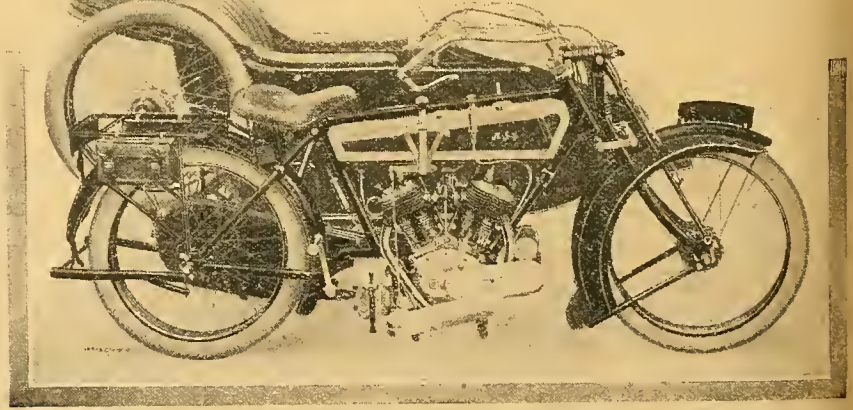
How the War Funds Stand.

The principal war funds amounted to the following figures on Tuesday last :

	£	s.	d.
H.R.H. Prince of Wales's National Relief Fund	4,053,000	0	0
H.R.H. Princess Mary's Fund to provide Christmas Gifts for Soldiers and Sailors	123,309	0	0
The Queen's Work for Women Fund	95,161	0	0
The Times Fund for Sick and Wounded ...	718.025	8	4
The Daily Telegraph Belgian Relief Fund ...	80,661	0	1

Affiliation Fees.

To prevent any possible misunderstanding in connection with our recent paragraph on the subject of affiliation fees and club finances, we should point out that our remarks referred to those clubs affiliated to the A.C.U. under the 5s. per head scheme. The other scheme, viz., 6d. per head, is a very nominal amount, and should not tax the resources of any sound body.



The 1915 model 6 h.p. A.J.S. three-speed sidecar outfit. The sloping top tube has been adopted on this model; the detachable wheels are retained. (See page 663.)

Club Profits for National Fund.

A profit of £10 5s. was made on the Bristol Motor Cycle Club's reliability trial, described in our last issue, and in accordance with a recommendation of *The Motor Cycle*, that amount will be handed over to H.R.H. the Prince of Wales's National Relief Fund.

Despatch Rider's Novel Training.

A motor cyclist, who expects to receive orders shortly for the Front, has been attracting attention at Cudham and the test hills by his novel training methods. Attired in semi-regimentals and with revolver in a sling strap, he was seen to make several climbs at Cudham, part of the way with revolver in hand as though firing at some imaginary foe. This movement would be varied by skilled cornering into the side tracks and lanes.

Brake Testing.

How the machine—a well-known T.T. twin—stood the racket is a wonder. Another manœuvre consisted in jamming the brakes hard on, making a flying dismount, and levelling the revolver as though suddenly confronted with an enemy patrol.

New Australian Records.

The mile and half mile single-cylinder motor cycle Australian records have been beaten by A. Byrom, of Tenora, New South Wales, a well-known record breaker of Australia. His times were : half mile, 26⅖s. ; mile, 54⅖s. The engine used was a Precision 3½ h.p. with side by side valves.

A Victim of Enteric.

A. L. Ommaney, a member of the Coventry and Warwickshire Motor Club, who was formerly in the testing department of Rudge-Whitworth, Ltd., has recently succumbed to enteric fever in the General Hospital, Colombo. Three years ago Ommaney went to Ceylon as a planter.

An American Motor Wheel

When a well-known motor cycle dealer of Toronto, Canada, applied for selling privileges of the Smith Motor Wheel, made by the A. O. Smith Co., of Milwaukee, Wis., he was advised that the company could not make any arrangements for the sale of the attachment in Canada for some time to come because of the great demand in the States. This is a disappointment for Dominion dealers because it is felt that the Smith Motor Wheel would take well in Canada, partly because of the similarity with the Wall Auto-wheel made and used in the British Isles.

Despatch Riders and Licences.

At Bexhill Police Court, V. Jones, a corporal in the 25th Reserve (County of London) Cyclist Battalion, was summoned for riding a motor cycle without a licence.

Lieutenant A. R. Churchill, of the same regiment, said he had been instructed to appear in the case on behalf of Colonel Gilbertson Smith, his commanding officer. The regiment was stationed at Lewes, and they were charged with the duty of taking over coast defence along the sea coast of Sussex, and he wished, with the greatest respect, to protest against the action of the civil authorities in such cases as the present, because again and again they had summoned the men of the regiment for various trivial matters. Lieutenant Churchill explained that the machines were registered in the name of the Home Secretary, and that a licence was not needed. Therefore, he asked for the dismissal of the summons, and, at the same time, he wished to be allowed to enter his emphatic protest at having been brought to the court on such a case. The case was dismissed.

We wonder if soldiers will next be prosecuted for not having gun licences.

A Business Trip to the U.S.A.

We understand that Mr. W. W. Douglas sailed last Saturday for New York on a business trip. He expects to be away for about three weeks.

Motor Cycle Racing in New Zealand.

Now that things have settled down here somewhat and business is running again in ordinary channels, it has been decided to continue the competitions, trials, etc., decided upon by the Pioneer Motor Club before the war. The beach races at New Brighton on Oct. 24th resulted as follows : Eight-mile Open Handicap—1, Berry (Douglas); 2, Laughton (Rover). Sixteen-mile Open Handicap—1, G. B. Brown (Triumph); 2, Laughton (Rover); 3, Berry (Douglas). Four-mile Novice Handicap—1, C. Orr (Triumph); 2, C. Farrow (Triumph).

Motor Cyclists with the King in France.

During the King's visit to the Front three motor cyclists accompanied the royal cars during tours of inspection.

A Flying Visit from Corporal Sproston.

Corporal A. J. Sproston, R.E., was in London last week, and we were able to congratulate him over the telephone upon having been mentioned in despatches.

A Patriotic Club.

The Moto-Club-Liègeois was formed into a company of motor cycle volunteers immediately the war broke out, was officially approved by that gallant Belgian hero, General Lehman, and was attached to the staff of the 3rd Belgian Division.

Douglas Sidecar in the Bristol Trial.

With reference to the statement in our report of the Bristol M.C.C. trial that the new 4 h.p. Douglas and sidecar went astray, Messrs. Douglas Bros. write that the machine completed the whole course, the only trouble suffered being from tyres.

The Indispensable Motor Cyclist.

During the annual manœuvres it was apparent to all that the motor cycle was to play an important part in any future war, but we doubt if even the military authorities realised the indispensability of a motor cyclist despatch rider in a war in which the fighting line is spread over a wide range.

Motor cyclist despatch riders attached to the Royal Engineers arriving at Luton after leave. The machine is a 6 h.p. New Hudson, of which the company already have six.

1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

1915 WULFRUNA MODELS.

A NEW two-stroke model is perhaps the most striking departure of the Wulfruna Co., of Wolverhampton, and, as might be expected, it has been carried out in a thoroughly workmanlike manner. The frame is solidly constructed, and has a bottom bracket specially adapted for the fitting of a two-speed gear if required. The machine thus fitted has a very neat appearance, and forms a sound machine for touring or town work. The 2¼ h.p. Peco engine is used, and on the two-speed model the most striking external feature is the fact that the flywheel lies close to the cylinder carrying the sprocket for the driving chain on the outside. This, of course, simplifies the fitting of chain cases, and the Wulfruna have taken full advantage of the opportunity. Otherwise the 2¼ h.p. Peco follows the design of the already well-known 2¾ h.p. model, except that plain bearings are used on the crankshaft. The two-speed gear is the usual counter-shaft type employed by the company, and is solidly but neatly constructed. If ordered, a kick starter and clutch can be obtained at a small extra. As regards fittings, the machine is complete in every way. A drip feed lubricator supplies the oil to the engine, and mudguards, carrier, and stand are of sensible proportions. 26in. × 2in. tyres are fitted, and aluminium footboards add considerably to the rider's comfort. A similar model can be obtained fitted with a 2½ J.A.P. engine of 70 × 76 mm. bore and stroke. The final drive in each case is by belt.

Other New Models.

Another new model which has been introduced specially for sidecar work is the new 5 h.p. twin, which is fitted with a J.A.P. engine (70×85 mm.), and drives by chain throughout, a three-speed countershaft gear being employed, and a cone clutch being fitted on the engine-shaft.

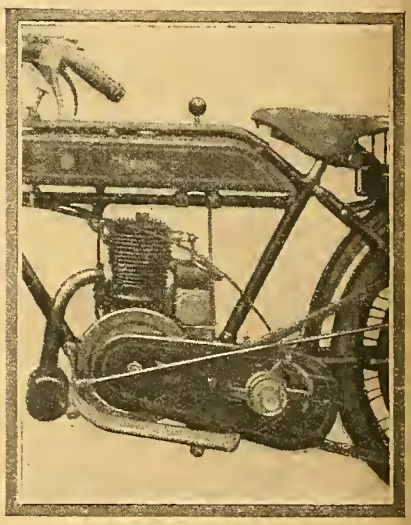
The machine is thoroughly up to date in every way, and the fittings and finish are excellent throughout.

The 4 h.p. single cylinder Wolf would at first sight appear to be a new model, but in reality the change in appearance has been mainly brought about by the lowering of the frame. The new machine is extremely neat and sturdy. It is, as before, fitted with the 4 h.p. single-cylinder J.A.P. engine, but a choice is given of two or three-speed countershaft gears and either double chain or chain and belt drive. Thus the 4 h.p. model can be obtained in almost every possible form, and suitable for the man who wants a fast single-geared mount through the various stages of the ordinary solo tourist to the owner of a go-anywhere sidecar outfit. As a point of interest, it may be mentioned that Wolf frames are specially reinforced at all vital points.

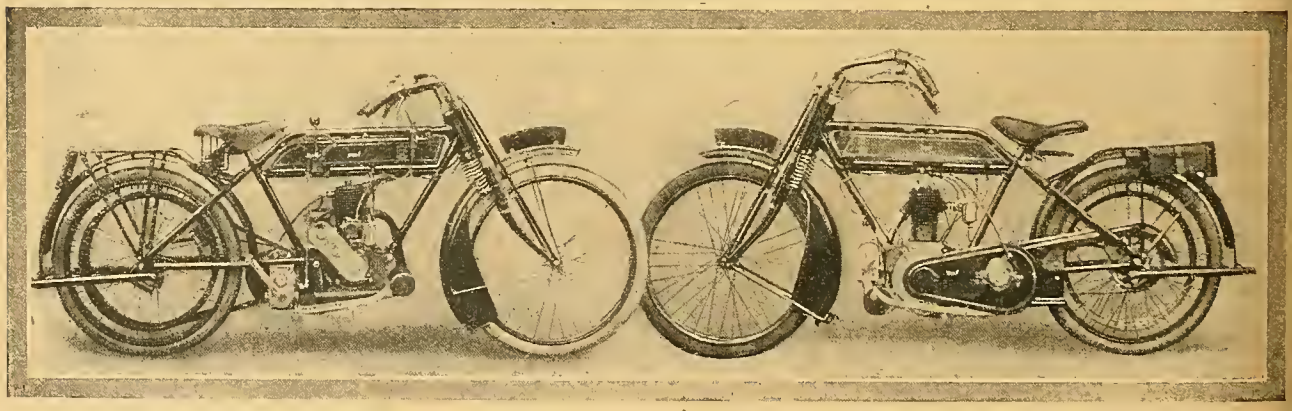
EDITORIAL NOTE.

ALREADY many full descriptions of 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions were published:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Abingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	22nd.	J.A.P. engines, Calthorpe, Lucas dynamo.
,,	29th.	Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2½ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun Vitesse, and Levis.
,,	19th.	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.
,,	26th.	Rudge, O.K. Junior, Wooler, New Imperial, J.H., Lady's Radco, Wulfruna, Bradbury, and Hazlewood.
Dec.	3rd.	Norton, Grandex, Connaught, Brown, Clyde, Brough, and Lady's Ivy.



The Wulfruna two-stroke, showing chain drive from a sprocket fitted outside the flywheel



The 2¼ h.p two-stroke Wolf motor bicycle which is fitted with two-speed gear and kick starter.

Transmission side of the 4 h.p. Wolf

THE NOVEL PREMIER TWO-STROKE.

Engine, Three-speed Gear, and Magneto forming a Single Unit.

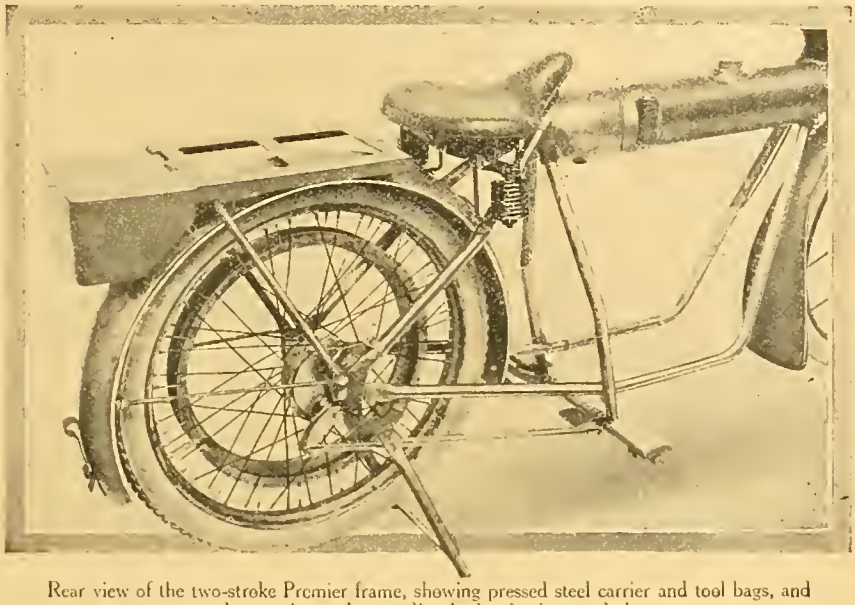
IN the "Buyers' Guide" issue of *The Motor Cycle* we were enabled to give the first details and sketches of the new Premier twin two-stroke, and by reason of its novel and striking design great interest has been evinced by all interested in motor cycles.

The twin engine, which is built under Alfton's patents, is now undergoing tests. In this issue we are enabled to publish illustrations of the power unit and frame; the latter are strikingly unusual both in detail and in general design. The compactness of the unit will be clearly seen from the photographs. In front is mounted the outside flywheel; then come the two cylinders set longitudinally and operating the crankshaft through vertical piston rods and curved foot plates.

Forced Feed Lubrication.

At the back of the crankshaft a plunger oil pump is driven from an eccentric, and forces oil to the big ends and foot plate slides, and behind this again lies a pair of worm wheels driving the counter-shaft three-speed gear. This gear is very neat, and occupies an extremely small space, as the gears are only just separated, and are brought into action by a central shaft arranged so as to expand steel balls against the inner periphery of the pinions, thus locking them to the driving-shaft in turn. To prevent any possibility of the gears slipping out of position a simple and positive form of spring plunger is arranged, and the control rod from the tank operates through a squared joint giving just sufficient freedom of movement. Finally, the magneto is mounted at the rear of the unit, and is driven direct from the crankshaft. Except for the piston rod bearings and slides, ball bearings are used throughout, and careful provision has been made for the prevention of oil leaks, a screwed washer mounted on the shaft returning any excess of oil to the sump.

The special receivers in which the gas is compressed can be clearly seen, and also the expansion chambers, which are attached direct to the exhaust ports, and permit the burnt charge to expand before being led to the large silencer directly in front of the engine. These expansion chambers will, in the final design, be fitted with cooling ribs.



Rear view of the two-stroke Premier frame, showing pressed steel carrier and tool bags, and also two internal expanding brakes in the rear hub.

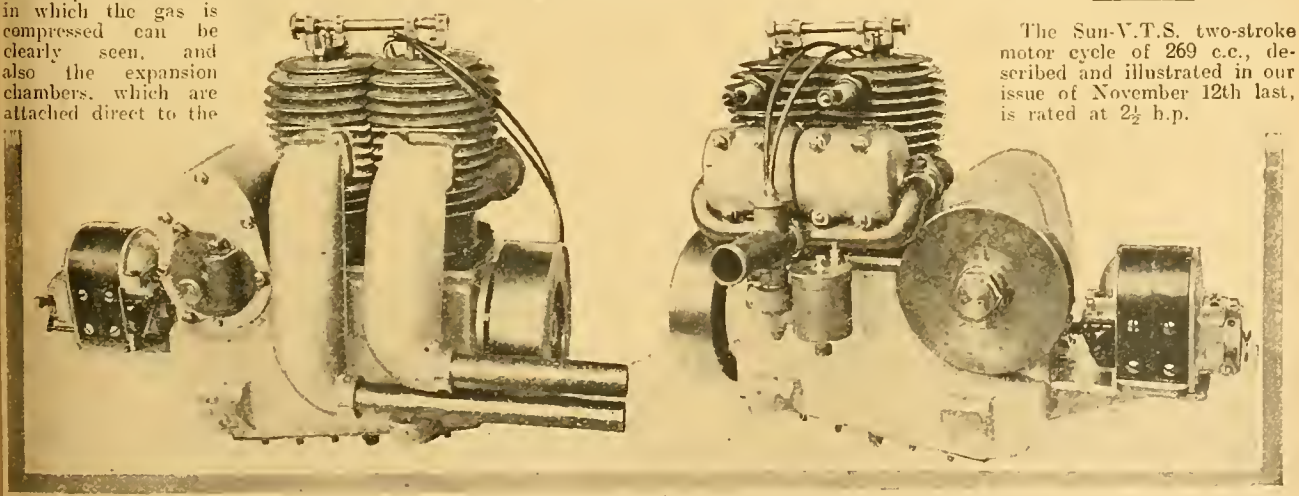
Operation of Compression Release Valves

The compression release valves are very simply operated, for a straight bar is mounted in guides directly over the valve in each cylinder head. A taper is formed with its smallest diameter kept normally over the valve stem by a spring. By means of a Bowden control the bar can be moved horizontally so that the tapers engage the valve stems and release the gas.

The principle of the duplex frame with its top tube tank has already been described. It may be remembered that both brakes are of the internal expanding type mounted in the rear hub. The mudguarding is excellent, and the rear guard is attached to a combined pressed steel carrier and tool box. The frame is extremely low, and the absence of tubes above and below the tank renders the machine particularly easy to clean.

The machine is the most novel and interesting medium weight we have yet seen, and we are looking forward with considerable interest to a road trial in the near future. We shall then hope to refer to the new Premier again.

The Sun-V.T.S. two-stroke motor cycle of 269 c.c., described and illustrated in our issue of November 12th last, is rated at 2½ h.p.



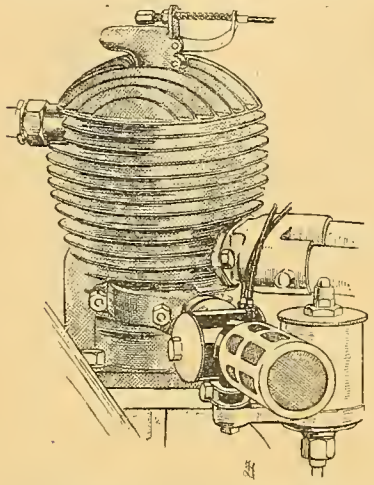
A novel two-stroke Premier. As will be seen, it has two vertical cylinders and an outside flywheel in front of the engine. A three-speed gear is embodied with the crankcase, and the magneto is coupled direct to the crankshaft

THE O.K. TWO-STROKE.

An Entirely New Model in Addition to Existing Four-stroke Models.

ONE of the most striking departures in the O.K. programme, which we have already reviewed, is the new two-stroke, which has many features of peculiar interest. This new model is known as the Mark V., and it can be obtained as a single-geared mount, or with two-speed counter-shaft gear, or with two-speed gear and clutch, in each case the price being strictly reasonable.

The engine has a bore and stroke of 70 mm. × 70 mm., giving a capacity of

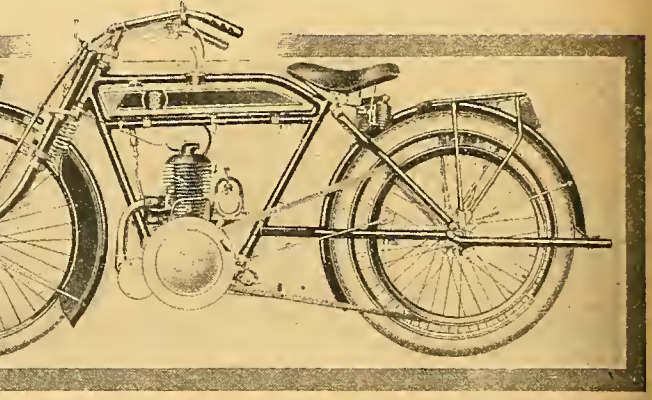


O.K. two-stroke, showing position of ports, double exhaust pipe, and release valves.

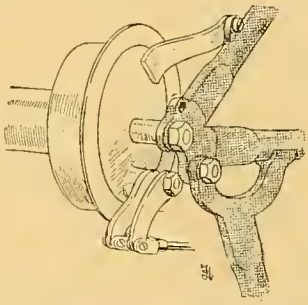
269 c.c. It is very carefully constructed throughout. The ports are of ample size, and two exhaust pipes, each of one inch diameter, ensure an absence of back pressure between the engine and the large silencer mounted in front of the unit. The crankshaft runs in plain bearings throughout, all the bearings being long and the shaft carefully hardened and ground, points which tend to increase considerably the life of the bearings. In combination with the excellent cooling arrangements with radiating ribs extending down almost to the base of the cylinder, the lubrication system proves most effective. Oil is led direct to the cylinder from a Best and Lloyd sight feed drip, and we are told that no single instance of seizure has occurred even under most adverse circumstances.

A Senspray carburetter is fitted at a slight angle from the side of the cylinder. The magneto is chain driven, and lies high up behind the cylinder, where it is well protected from the effects of mud and rain. The two-speed gear is of the sliding dog type, and a cork insert clutch can be obtained as an extra. The drive is by belt and chain, except in the case of the single-geared model, which has a plain belt drive.

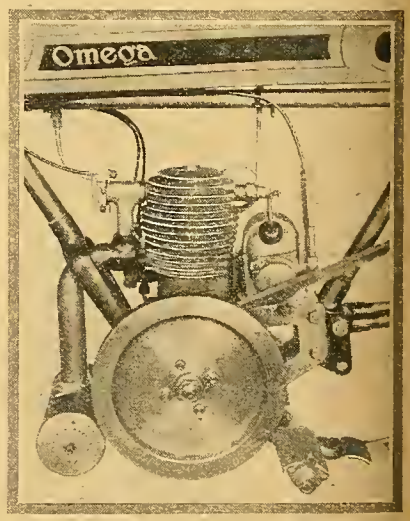
The frame is a powerful one, and, in spite of the large diameter flywheel, provides a 5in. ground clearance. All the fittings are of ample proportions. The pan saddle is a luxury not too often provided by lightweight manufacturers. We were pleased to note that the rear mudguard extends below the belt, which is one of the most simple effective methods of preventing belt slip yet devised. Druid type forks ensure easy suspension of the front part of the machine.



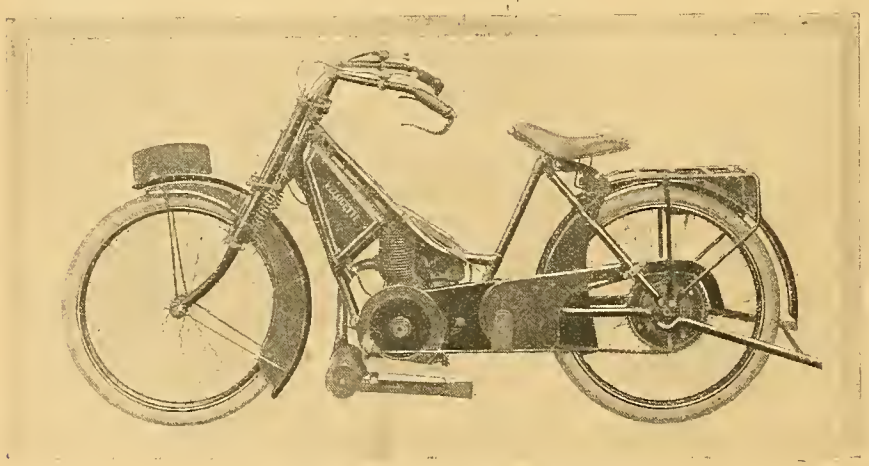
The O.K. two-stroke—a new mount for 1915 of neat design.



Both brakes of the new two-stroke Premier are of the expanding type, and are carried in the rear hub.



Power plant of the 1915 two-stroke Omega. (*Described and illustrated Nov. 5th, page 508B.*)

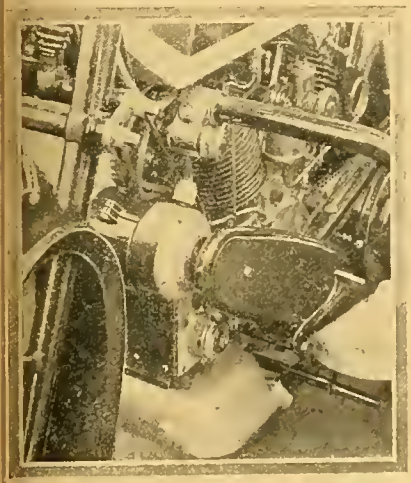


Lady's new model Velocette. (See page 663).

This very handy little touring mount does not, of course, replace the well-known O.K. Junior Mark III. and IV., which have already been illustrated; it is purely a supplementary model. The new O.K. factory will be responsible in the future for all the products of Messrs. Humphries and Dawes, which accounts for its large dimensions and excellent

A.J.S. MACHINES IN 1915.

DURING last week H. Taylor and Co., of 21a, Store Street, Tottenham Court Road, W.C., had a most interesting exhibit of all models of A.J.S. machines. In our issue of November 5th, page 509, we published a description of the new 4 h.p. twin-cylinder machine of this make. All the latest A.J.S. models possess similar features, such as sloping top tube, excellent mudguarding, chain guarding, etc., but in the case of the more powerful 6 h.p., these items are proportionately



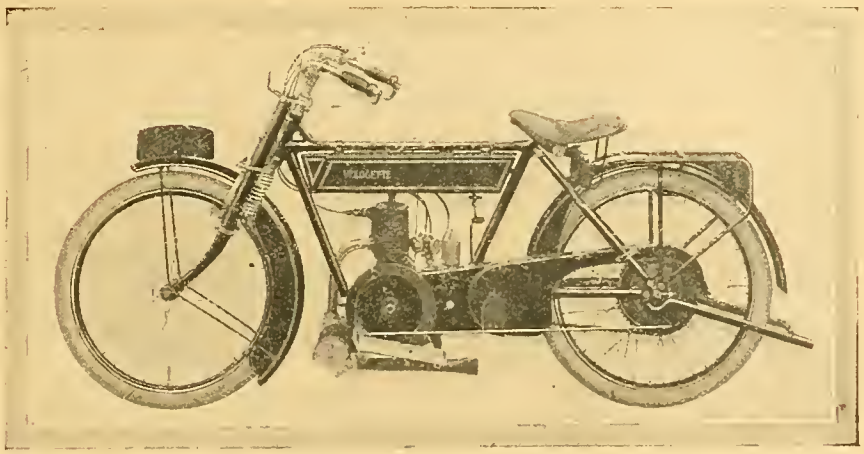
A 6 h.p. 1915 model A.J.S. fitted with Lucas dynamo, which can be seen attached to the front down tube. It is driven by an enclosed chain.

stronger. Even the popular 2¾ h.p. follows more or less the same lines, but a distinct innovation is the 2¾ h.p. sporting model, which has not been previously described in any journal.

It is fitted with semi-T.T. handle-bars and footrests instead of footboards, while the after portion of the chain guarding arrangement is done away with. The silencer consists of a single pipe, which terminates in an aluminium fan-shaped end.

Like all A.J.S. models, it is fitted with detachable wheels. These are removed by undoing three large bolts and the central spindle. On the spindle being withdrawn a small piston falls out. In the case of a tube repair, the tube can be passed through the forks without there being any necessity to take the wheel right out.

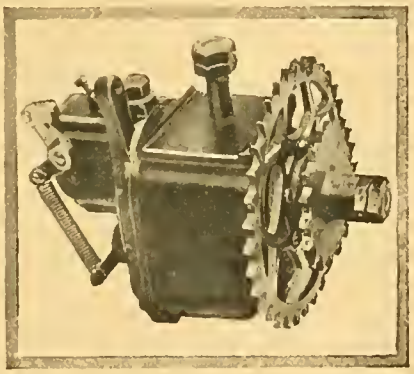
All the models shown are fitted with three-speed gear boxes, though the 2¾ h.p. machines may be had with two-speed gears if desired. The 6 h.p. machine is a thoroughly practical sidecar outfit. It is what is commonly termed a de luxe model, and one type may be had equipped with a Lucas dynamo lighting installation. In this case it will be noticed that the dynamo is carried on the front down tube of the motor bicycle frame, the drive being by chain from the engine shaft. The four models displayed formed a most attractive exhibition, while their smart appearance and attractive finish did not fail to attract admiration.



The 1915 model two-speed chain-driven Velocette.

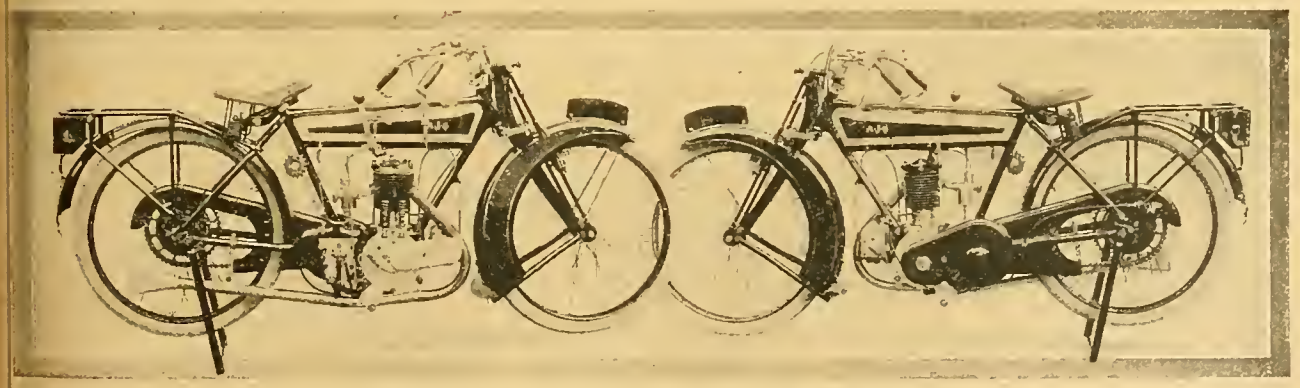
AN OPEN FRAME VELOCETTE.

IN our issue of November 19th we published details of alterations and improvements in the Velocette engine and transmission, though at the time a complete machine was not available for photographic purposes. The illustrations we are now able to publish show the neat lines of the new models. The 60½×73 mm. engine is mounted in a loop frame, and the machine, which is strikingly compact and workmanlike, is chain-driven throughout. A spring drive and internal rear brake are included, and the carrier is arranged to take a special tool bag, which in no way detracts from the general appearance of the machine.



Neat cast iron gear box of latest Velocette. A sliding key is used to engage two different ratios.

Altogether the machine gives one the pleasing idea that every part has been designed to fit in its proper place, an idea which we regret to say is only too seldom afforded by most light and reasonably priced motor cycles.



The new 2¾ h.p. A.J.S. sporting model. It is fitted with detachable wheels.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Removing Flywheels.

Sir,—In reply to the query of "H.A.C." in *The Motor Cycle* of November 26th, I may say that the best way of removing Douglas flywheels is as follows:

Unscrew the lock-nut a couple of turns or so, and then insert a fairly thick screwdriver between the crank case and the engine sprocket. Give the screwdriver a sharp tap or two, and then place a bit of scrap iron or tough wood over the lock-nut, and give one or two sharp taps with a hammer. The screwdriver will then drop out, and the nut may be unscrewed and the flywheel removed. I have removed seven or eight lately, and not had the slightest difficulty If the wheel does not move at the first attempt, keep tapping the screwdriver a bit, and again strike the nut.

ED 663.

Sir—In answer to the question of "H.A.C.," in *The Motor Cycle* of November 26th, as to a simple method of removing Douglas flywheels, I would submit the following as being in every case effective when the engine can be started.

The nut is slackened two threads from the crankshaft, and the engine is run either down the street or on the stand, but not raced at all. If run on the stand put gear in and press brake on slightly, so as to give engine some work to do. A moment will be quite long enough to allow the flywheel to be removed by the hands from the taper, without having hurt in the slightest the ball bearings or the crankshaft. The reason this method is a success is because of the inertia of the flywheel, and when an explosion takes place the blow on the crankshaft is so sudden that the inertia of the flywheel cannot adjust itself quickly enough. Hence it becomes loose on the taper—often on the very first explosion of the engine. I hope this will be what "H.A.C." and others desire. ALBERT V. HUGHES.

Sir,—I noticed in your issue of November 26th a correspondent enquires as to how to remove a Douglas flywheel, and it made me smile to see the reply to it by H. P. Fisher in the issue of December 3rd, when he suggests two people on the job with a 3 lb. hammer performing the operation. This appears to suggest that if assistance is not available you cannot remove the flywheel. I have found it quite a simple matter to remove the flywheel of my Douglas single-handed. I first remove the nut, and tie the exhaust lift up to the handle-bar. Then, while slowly moving the flywheel round with the left hand, gently tap the inside edge of the flywheel with an ordinary hammer (in the right hand), after first wrapping a piece of rag round the hammer head. A mallet would be preferable, but there is no fear of cracking the flywheel, as it is of steel. It comes away very easily. W. G. PERRY.

The Bristol Trial.

Sir,—It was announced in the regulations of the open eighteen-hour trial of the Bristol Motor Cycle Club that all surplus would be handed over to one of the war funds.

I enclose herewith the account of the trial, submitted to me by the hon. secretary, and you will find, after paying all expenses, there is a balance of £10 5s., which is to be handed over to some fund, and I should be glad if you will suggest one.

Please note the costs of the medals (one gold and one silver) are being paid out of the club's prize fund, also the A.C.U. permit fee of £1 1s. has not been charged up in this account, whilst the timekeeper, checkers, and loan of cars have been given gratis.

STATEMENT OF ACCOUNT.

Entry fees			£18 0 0
Stationery	£5 5 0		
Stamps	1 15 0		
Telegrams	5 0		
Car driver	10 0		
		7 15 0	
Balance			£10 5 0

I might point out to you my club gave £10 10s. to the Princess Mary's Christmas Fund. This was originally intended to be given to *The Motor Cycle* Fund for Despatch Riders.

It is proposed that the club adheres to its original programme of holding an open twenty-four-hour trial to the Land's End and back on January 1st and 2nd, 1915, and so we look forward to real support.

PHILIP GROUT,
Hon. Sec. and Treasurer Bristol M.C.C.

[We congratulate the Bristol Motor Cycle Club on the result of the competition, and recommend that the profit be allocated to the National Fund, *i.e.*, H.R.H. the Prince of Wales's Relief Fund.—ED.]

The Design of Drip Feed Lubricators.

Sir,—Your contributor "Runabout," under point two in his article on the above subject (December 3rd, page 610), calls for a lubricator with which it is possible to inject a whole pumpful of oil instantaneously in emergencies without disturbing the drip adjustment.

May we call your attention to our Enots Auto Feed with auxiliary pump, which perfectly fulfils this desideratum, and gives ocular proof of exactly how much lubricant has been passed? This device has been noticed and advertised in your columns, but, apparently, the subject is of sufficient interest to warrant a little further attention.

By means of this lubricator any part of a pumpful, or any number of pumpfuls, may be injected instantaneously at will without interference with the drip adjustment in any way, and the drip feed is resumed immediately and automatically. All oil passes through the glass dome chamber, thus affording certain proof that the object in view has been achieved. Many thousands are in use and may be seen on the machines of leading makers.

BENTON AND STONE, LTD.
W. WHITE (Secretary).

Why an Engine Konks.

Sir,—The subject of konking is one which I was very pleased to see revived in the pages of *The Motor Cycle*, as it seems to be still an unsolved problem. Some of your correspondents have obviously settled the matter in their own minds, but as their conclusions vary so much it leaves the average motor cyclist more mystified than ever.

Mr. de Lissa very emphatically states that a slack piston is the cause of the trouble, and tells us that it can be cured by fitting a piston which is on the tight side. Mr. de Lissa is, as everyone knows, a motor cyclist of long standing and wide experience; but, really, Mr. de Lissa! a tight piston may be a cure in a few special cases, but the two worst konkers that I have come across in the last twelve years have been a certain 3½ h.p. of 1909 and a machine of somewhat similar design, but of a much later date. Both these machines have had smaller piston clearance than any others I have met with. On the other hand, I have possessed four machines (three of them twins) which it was almost impossible to make konk; in each case the pistons were on the slack side, and one (which practically refused to konk under any conditions) had a piston clearance of ten-thousandths (.01), which may be considered almost excessive. Also I believe that the excellent J.A.P. engines are fitted with pistons having very little clearance, and yet the J.A.P. is not guiltless of konks. I am prepared to believe that the piston is at the bottom of the trouble, but Mr. de Lissa's solution will not pass in many cases.

In this connection I would like to put forward a suggestion purely for what it is worth, and not as a definite solution. I have noticed that nearly all engines with detachable cylinder heads are practically immune from konks, and it has struck me that cylinder distortion may cause the noise to a large degree, as distortion would be somewhat relieved in the case of the type mentioned.

A. T. GATEHOUSE.

Sir,—Just a word or two on this evergreen topic. I think Lodge Bros. have hit the solution that konking is due to pre-ignition, the metallic sound being due to the exploded gases knocking against the piston head and walls of combustion chamber. I have run single, twin, and four-cylinder motor cycles, and the part which *has surprised me* is that my four-cylinder never konks, but under similar conditions, which would make a single or twin konk, my four-cylinder machine "peters out."

Herein lies a fact which, I think, will give a clue—if one is wanted—as to the metallic sound. Of course, I don't pose as an authority, because to me the whole thing is so simple, and I don't want an engine that konks.

What I would like to see is some form of "governor ball" regulator to the spark advance and retard of the magneto, so that it was automatically worked according to the speed of the engine, then I think konking would be a thing unheard of. GOVERNOR BALL.

[Such a device has been on the market for some years.—ED.]

A Problem Solved more by Luck than Judgment.

Sir,—The following incident which occurred to me recently may be instructive to some of your readers. Whilst taking a joy ride, my machine, which is a 5-6 h.p. Rudge-Multi, refused hills which, in the ordinary course of events, I should not trouble to change gear for. The belt was not slipping, the compression was good, the clutch was in order, the carburetter was perfect, the make and break of magneto was making and breaking, the sparking plug was sparking; in fact, everything apparently was in order, and yet the machine would only run on the level or stand.

Being a Colonial rider, I carry every conceivable spare part, but the question was which spare to start with; the spare plug went in, but with the same result. The problem was solved by attaching the spare complete contact breaker. The cause of the trouble I did not find out until I reached home and compared the two contact breakers. I found that the platinum points of the business contact breaker had about double the gap of the shirker. To make quite sure that this was the cause of the trouble I replaced the shirker after increasing the break of the platinum points

Being a rider with little experience, I naturally thought that I had found out something, but my ardour was subsequently damped when I referred to the "Rudge Wrinkles," which states, *inter alia*, "We have known cases where the otherwise unaccountably sluggish running of an engine has been vastly improved by increasing the break of the platinum points on the magneto." So have I. W. POINTER.

Fort Beaufort, Cape Colony.

Two-speed Hubs.

Sir,—I was very pleased to see the remarks of "Ixion" *re* a light, cheap, two-speed hub for moderate touring. What he calls for is really wanted—not by a few, but by many riders of light and medium weight machines, ladies included. Let us hope the manufacturers will not keep us too long waiting for its advent.

Also, can any of your readers tell me of a strong, simple, two-speed hub without a clutch (I have a good clutch on engine-shaft), suitable for a 3½ h.p.; gears, say, 4 and 8 to 1? HUB.

Good Advice.

Sir,—In your issue of November 5th, 1914, you advise "J.C.P.," who complains that his Scott will not run slowly, to clean his transfer port gauzes and see that there are no air leaks in the induction pipe.

I have had similar trouble to "J.C.P.," so followed your advice, except that I found it better to buy new gauzes. The induction pipe joints were bound round with tape, and the exhaust ports were also cleaned out by removing the exhaust port cover plates.

The engine now starts at the second kick, and runs at 8 m.p.h. on top without knocking. The carburetter is a Scott, and the machine has been out nearly every day for the last eighteen months without taking down the engine.

LIMIT GAUGE.

Riding Upstairs.

Sir,—I notice in a recent issue an illustration of a motor cyclist riding up and down a flight of ninety-seven stone steps in Rome.

This rider need not have gone to Rome to have found a flight of steps on which to practise riding. At Macclesfield there is a thoroughfare of 108 steps, called "Th' Hunderd an' Eight Steps, leading from the Waters Green to t'owd Church."

I guess this little flight of steps would test the best motor cycle in Great Britain. Its gradient towards the top is somewhere about 1 in 6.

I may say that it is quite a training ground for children.

J. F. TIDESWELL.

Improvements.

Sir,—*Re* "Ixion's" paragraph about a light two-speed hub gear devoid of clutch or complications. This is just what I believe almost every user of a variable pulley gear (*i.e.*, Brampton, etc.) has come to see would solve the gear problem for him at any rate. Why only for lightweights is a clutch necessary with a low gear of 15 to 1 and a rubber belt passing from free engine position to take up the drive? Another point. May I draw the attention of designers and others who mould the machines of the future to the excellent webbed head lug of the American Excelsior illustrated in your issue of November 5th? How is it that on the eve of 1915 we are getting old mistakes repeated and perpetuated? I beg humbly to submit that such things as single forks on light or any weight machine, twisted top tubes, single supports to carriers, frames that form four and five-sided figures, frame tubes meeting at the head almost at a point, single tube frames, flimsy front mudguards, and, last but not least, the tool bag jauntily situated on the top of the carrier, are now out of place. I do not submit that all the above may be found on any one machine, but let anyone look through *The Motor Cycle*, and he will find them. I notice that there are signs of the curved top tube giving place to a straight one, which seems to me a step in the right direction.

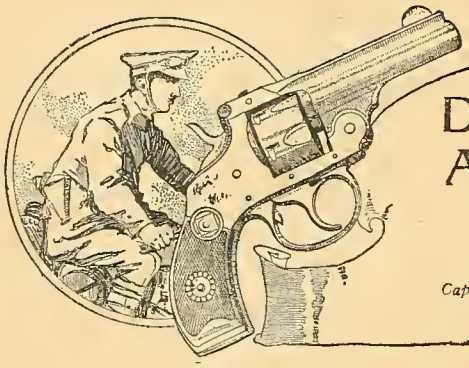
I hope I may not be thought hypercritical, but every motor cyclist is keen to see improvement in design.

APERCU.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.



DIARY OF A DESPATCH RIDER.

By Corporal Hedley G. Browne, of Norwich,

Captain Norfolk Motor Cycle Club, now Motor Cycle Despatch Rider, 2na Signal Co., R.E., with 1st Army Corps, British Expeditionary Force.

October 28th, 1914

I HAVE just learnt that we are permitted to state our whereabouts up to about a week ago, so I may record my movements since leaving Southampton.

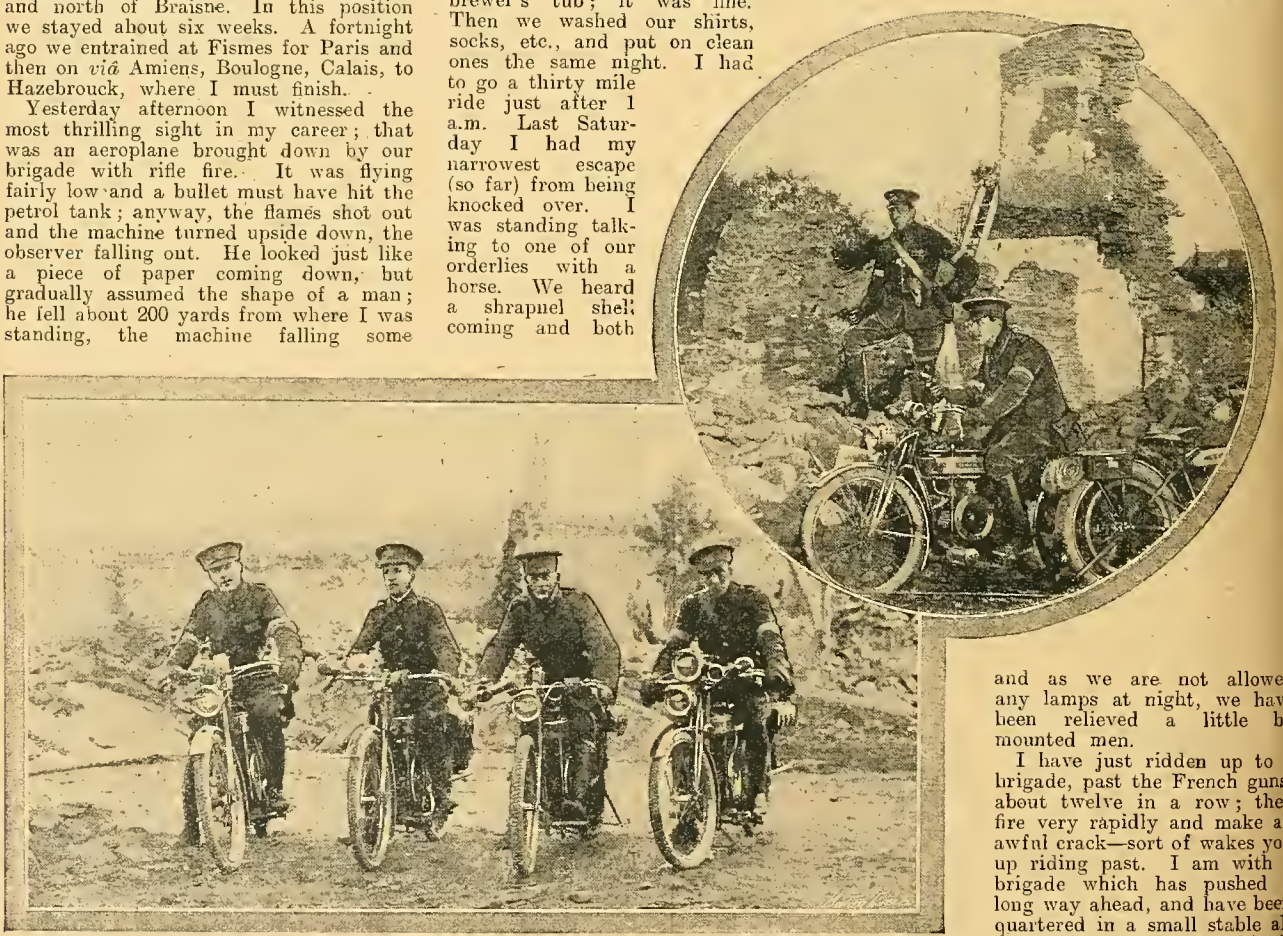
By boat to Havre and down the river to Rouen (two days stop), then by train to a small village north of Arras (Etreux), and marched in stages from there to Mons. Retreated *viâ* Mauheuge, Landrecies, le Cateau, la Fère, Soissons, to Meaux. After that went due east to Coulommiers, then up to the Aisne at a place called Bourg-en-Aisne near Soupir and north of Braisne. In this position we stayed about six weeks. A fortnight ago we entrained at Fismes for Paris and then on *viâ* Amiens, Boulogne, Calais, to Hazebrouck, where I must finish.

Yesterday afternoon I witnessed the most thrilling sight in my career; that was an aeroplane brought down by our brigade with rifle fire. It was flying fairly low and a bullet must have hit the petrol tank; anyway, the flames shot out and the machine turned upside down, the observer falling out. He looked just like a piece of paper coming down, but gradually assumed the shape of a man; he fell about 200 yards from where I was standing, the machine falling some distance away. I can tell you, it is one thing in my life I shall never forget.

Last week I had my first experience of rifle fire; it is not nearly so bad as shells. I had to go down a road just at dusk where "snipers" were concealed in the trees. I left my machine and walked some distance down a lane and could hear the bullets hitting the trees, etc., all along. Can you fancy me walking and running with dead and wounded lying about on each side? My machine was hit with a piece of shell which I picked up and am keeping as a souvenir. I had my first hot bath last week in a large brewer's tub; it was fine. Then we washed our shirts, socks, etc., and put on clean ones the same night. I had to go a thirty mile ride just after 1 a.m. Last Saturday I had my narrowest escape (so far) from being knocked over. I was standing talking to one of our orderlies with a horse. We heard a shrapnel shell coming and both ducked our heads, but the poor fellow got hit and died in half an hour, and the horse was killed. Both were buried in the afternoon, and it was a most impressive sight with the guns firing all around. I can tell you it gave me a bit of a shock at the time, but in about half an hour I had forgotten all about it. Anyhow, the fellows said I was one of the lucky ones that day.

October 29th, 1914.

My word! this is war with a vengeance, going at it day and night. The last two or three days the roads have been terrible,



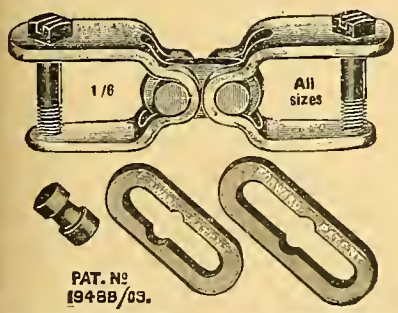
Some British despatch riders serving with the Expeditionary Force amid ruins—the handiwork of German artillery. The machines, it will be noticed, are Douglases.

and as we are not allowed any lamps at night, we have been relieved a little by mounted men.

I have just ridden up to a brigade, past the French guns, about twelve in a row; they fire very rapidly and make an awful crack—sort of wakes you up riding past. I am with a brigade which has pushed a long way ahead, and have been quartered in a small stable all day, and I must say this is the warmest place I have ever struck. They started shelling

'FORWARD' BRITISH ACCESSORIES for 1915.

As supplied to H.M. War Office.



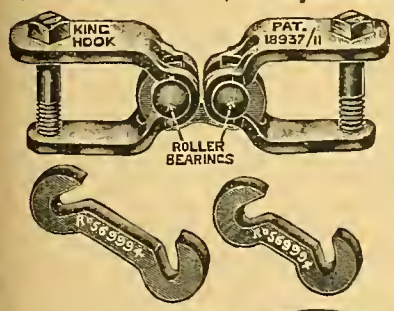
FORWARD. The strongest, best, and most reliable fastener in the world. As supplied to H.M. War Office in large quantities.

1/- each.

FORWARD leather-covered link, specially designed for use with Forward fasteners.

KING HOOK. The original hook fastener with flanged roller bearings. Insist on it, if you want the strongest hook fastener ever offered to you.

1/- detachable. **1/3** adjustable.



10d. each.

KING HOOK leather-covered link, specially designed for use with hook fasteners.

"FORWARD"

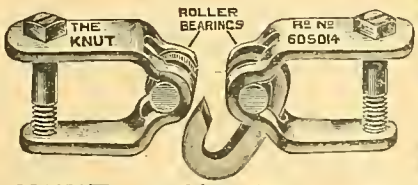
The British Plugs that make touring a pleasure.

Made in a dozen types to suit all requirements.

Type B (illustrated) with extra heavy pure nickel electrodes.

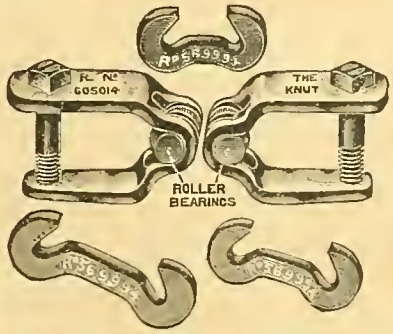
2/6 from all live Agents.

"Forward" Plugs are being ordered by H.M. War Office. Surely they will suit YOU.



KNUT. A high-class fastener at a popular price. Roller bearings and double-strength hooks.

9d. detachable. **1/-** adjustable.



CHALLENGE FASTENERS the lowest priced reliable fasteners on the market.

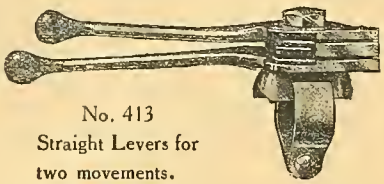
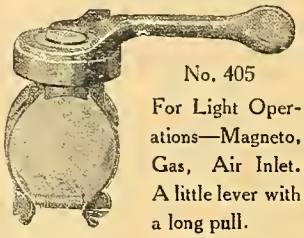
Control Levers for Bowden Wire

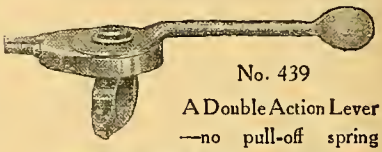
YOU have absolutely complete control of all vital movements at your finger tips if you adopt the Bowden Wire Control System. Bowden Control Levers are made in great variety—as you will see from a few of the types here illustrated. Our catalogue contains particulars of many others. Write for a copy to-day. Prices quoted are for levers only.



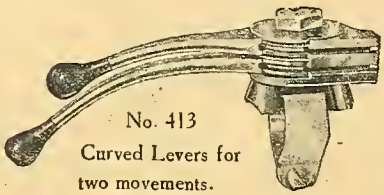
No. 413
Straight Levers for two movements.
7/6



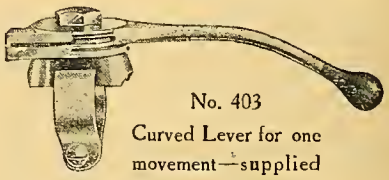
No. 405
For Light Operations—Magneto, Gas, Air Inlet. A little lever with a long pull.
5/-



No. 439
A Double Action Lever—no pull-off spring required—suitable for Spark Advance, Throttle, etc.
6/-



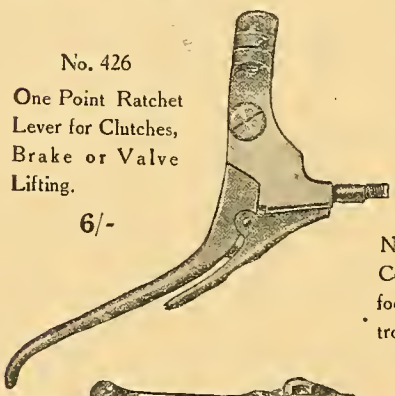
No. 413
Curved Levers for two movements.
7/6



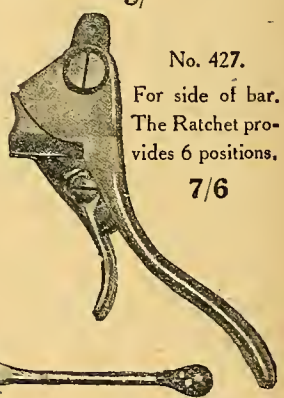
No. 403
Curved Lever for one movement—supplied with pin fitting if required.
5/-

Bowdenloc Control Levers.

No. 406.
Automatic and immediate in action. No springs used. Remains rigid.
7/-



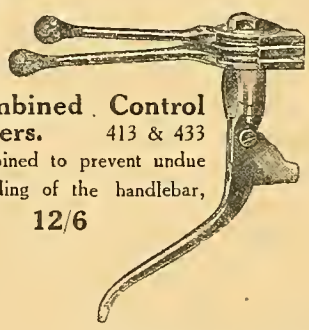
No. 426
One Point Ratchet Lever for Clutches, Brake or Valve Lifting.
6/-



No. 427.
For side of bar. The Ratchet provides 6 positions.
7/6

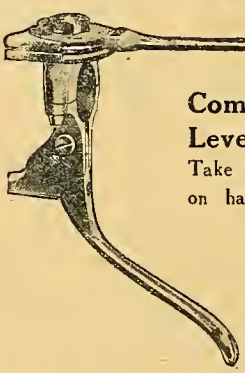
No. 11. Bowdenite Control Wire, **5d.** per foot, for valve, etc., control, nipples included.

No. 12. Bowdenite Brake Control Wire. **9d.** per foot, nipples included.



Combined Control Levers. 413 & 433
Combined to prevent undue crowding of the handlebar,
12/6

Two Levers,
Nos. 432, combined.
9/6



Combination of Levers. 403 & 433
Take up no more space on handlebar than one control.
9/6

When complete controls are ordered, inner wires are nippled and outer wires are capped free of charge.

Send remittance to cover cost and postage—any balance will be refunded.

BOWDEN WIRE LTD. LONDON
Pratt St. N.W.

Godbold.

us this morning at dawn with high explosives and "Jack Johnsons," and have kept it up off and on since. Up to the present this house has not been properly hit, but has been very near it. Two houses within twenty yards have been blown to pieces, and the shells have made holes in the ground all around big enough to bury a horse in.

Four big shells! My word, we have just had a fright. One got this roof and has made a large hole in it; one fellow was wounded in the leg. I have now had orders to stand by, so am now going to pack up. There are some French guns near us—that is what the Germans are trying for. Just imagine about twenty of us orderlies to different regiments being boxed up in this place. When we were asleep last night, the bullets came through the roof, in one side and out the other. Four more shells—too hot to write more now.

(1.) G. Boyton, who was the first private owner to finish in the 1914 Senior T.T. Race. The machine is a Triumph

October 31st, 1914.

Am glad to say we moved our quarters last night about three hundred yards down the road. Yesterday's casualties, two horses and one pig; not so bad considering the number of shells. One of the fellows who was in the Boer war said more shots and shells were fired yesterday than in all the South African war put together—he says it is not war, it is murder. We are now in a large farm house, one of the few left intact round here, and although by no means safe, we all feel more comfortable, as we are at the back of the house behind the enemy's fire. They have started again, but are still popping them around the place we left yesterday. We are replying with our "heavies," which are directly in front of us. They don't half make a report, and shake the very house.

I am writing this behind a hedge, with the bullets from German snipers in the trees in a wood close by whizzing over the top, just one mile from our trenches. Two of us managed to ride our machines up here, but goodness knows how we shall get back, what with the mud up to the spokes, etc.

November 5th, 1914.

Once again I am spared to write you a few lines, and when I say this you may take it that I really mean it from the bottom of my heart, for I have seen sights this last week that would sicken any human being Three days ago we had shells in a large château, our headquarters, killing, I think, six staff officers, besides wounding many others. Yesterday I took a message to A.H.Q., and was putting my machine on the stand (luckily about fifty yards away) when two shells landed right in the house, and two motor cyclists were killed (fellows we knew) and three others wounded. I jumped into a ditch, and

(2.) Howard Newman (the well known Ivy rider) mounted on a Douglas in Armentieres.

(3.) Not a tragedy of the war, but motor cyclists resting—after night work.

heard the bits falling all around. Returning back again along the main road I saw a large shell hole, which was not there when I made my outward journey. Such is the way we jog along day after day.

I am out at the —— Guards Brigade with a fellow named Barlow, and last night (after we had done a bit of riding in the rain, and had gone through roads a sea of mud) we made ourselves comfortable in a tobacco drying shed. What with straw and water-proof sheets we had quite a nice night (except for a pig waking us up once). After cooking a good breakfast of bacon, jam, and tea with milk (a real luxury), and having had the first wash for three days, we both felt in the pink of condition. To-day, we are about a mile from a large town, which they started to shell yesterday, and it is absolutely wicked here to see the damage being done to the Cathedral, shops, houses, etc., and then to see the inhabitants leaving, not knowing which way to turn, some carts going one way and some another. I had to go through it last night, and went in one house (not a sound). Things were just as the occupants had left them, tea on the table, nice fire, kettle boiling, etc. I sampled the bread and jam, but, of course, touched nothing else. On my way back a jolly great black shell hit a house a hundred yards behind me, filling the street with brick, glass, and smoke.

Just a word about the villages round here. Believe me, there is not a single church or house left; whole windmills and churches especially are smashed up as they harbour observation stations. Also the streets come in for it as well, great holes being made by these "Jack Johnsons," and we have to pick our way through these at night without a lamp! Just started the fireworks again; can hear the maxims at it and shells going

(4.) Sergeant Tozer enjoying breakfast in a stoneyard.

clean over where I am sitting into the town.

November 8th, 1914.

It is really quite a treat to be free from shells and bullets for a day, although I must not speak too soon. We are now in a farm yard a mile out of a large town, and up to the present the aeroplanes have not discovered our whereabouts, as we have our motor cars, motor cycles, and horses under cover. I believe I told you about the bombarding of this town. Well, last night it caught fire in several places, a special kind of shell being fired at it. Our engineers had to blow up the surrounding houses to prevent the whole town being burnt. I had to go through about eight o'clock, and it was a bit "warm," I can assure you. I am off to the —— Brigade again to-night with Barlow, so expect to be right amongst it. They have had a very rough time of it lately. There is some talk of our division being relieved for a bit, but I cannot say if there is any truth in it. We can all do with a rest, as I should say the old 2nd has just about done its share.

SIDECAR DRIVING IN IRELAND.

A Trip taken by Two Brothers on a Single-speed Bat.

ALTHOUGH perfectly conversant with the mechanism of motor cycles, and quite at home in the saddle of a solo mount, the writer had never attempted to handle a sidecar outfit until a short time ago.

The necessity arose whilst staying in Cork, as I was anxious to have an opportunity of judging for myself whether the scenery in the land of Erin really deserved the many laudatory epithets which are showered upon it. At the same time, I was totally unacquainted with the various routes from this famous city, and therefore decided to hire a motor cycle and sidecar, and share the driving with my brother, who fortunately knew the island fairly well.

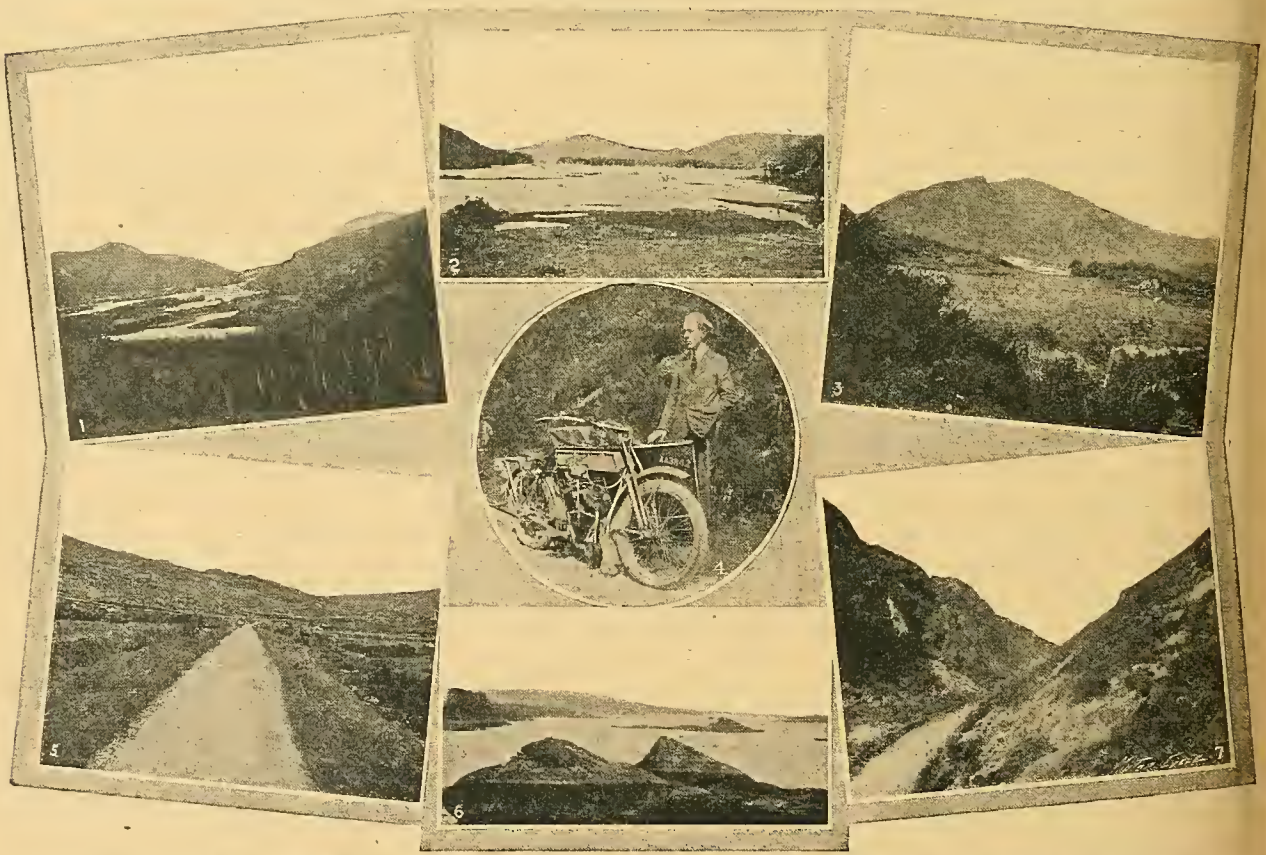
My first difficulty was to find a dealer from whom I could procure the necessary machine, but eventually an agent carrying a large stock of second-hand motor cycles was discovered, and from this source I obtained an old model 8 h.p. Bat with a coachbuilt sidecar.

Apparently the sidecar had been attached by a novice, for it was sadly out of alignment, and showed a distinct tendency to run into the gutter on the left of the road when being pushed out of the narrow lane which connected the garage with the main road.

To my dismay I found that there was neither clutch nor gear, and the only way to start up was to rush madly down the road until the engine began to fire and then leap into the saddle before the affection for the left kerb (already mentioned) had caused any inconvenience to pedestrians. Having gained this position, I discovered that it was impossible to throttle down below fifteen miles per hour without stopping the engine, and, as we were without any artificial means of giving warning of our approach, we caused no small amount of interest by our exceedingly hurried journey through the city, the streets of which were speedily cleared by our vocal activity.

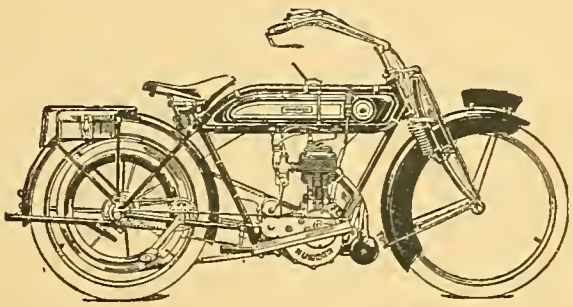
The double turn between St. Patrick's Street and St. George's Street convinced me of the fact that sidecar driving is quite different from solo riding, for, having forgotten the attachment for a brief moment when turning into the Grand Parade, I found that my passenger was taking an involuntary short cut across the pavement to the consternation of the citizens. In this connection I would suggest that there should be more give and take between pedestrians and vehicles, for, although the inhabitants of the city of Cork evidently prefer the roadway to the path, they strongly resented our unintentional encroachment on to their preserves.

When we eventually reached the end of Western Road, I heaved a sigh of relief, and determined to



(1) Panorama of the lakes at Killarney, on the road from Killarney to Kenmare. This is the best view obtainable of the lakes, showing almost the whole collection at once. (2) Mountain scenery at Killarney, showing snow-capped mountain on right. (3) Torc Mountain, Killarney. (4) The writer with the twin-cylinder 8 h.p. Bat and coachbuilt sidecar. (5) A typical mountain road near Killarney. (6) The harbour, Glengarriff. (7) The Pass of Keim-em-Eigh—a rough mountain pass between Inchegeela and Bantry.

The 1915 Humber $3\frac{1}{2}$ h.p.



THE outstanding features of the Humber "$3\frac{1}{2}$" are—first and foremost—Reliability, Economy, and Simplicity.

AS the Specification shows, it carries every modern improvement, and is the best value $3\frac{1}{2}$ h.p. 3-speed Motor Cycle on the market.

THE SPECIFICATION is remarkable at the price, and includes $3\frac{1}{2}$ h.p. Engine of 84×90 mm. Bore and Stroke; "Kick" Starter; Sturmey-Archer Three-speed Gear; Brown & Barlow Carburetter; Bowden Wires; Heavy Rubber-studded Dunlop Tyres; and Lycett Pan Seat or Brooks B 170 Saddle.

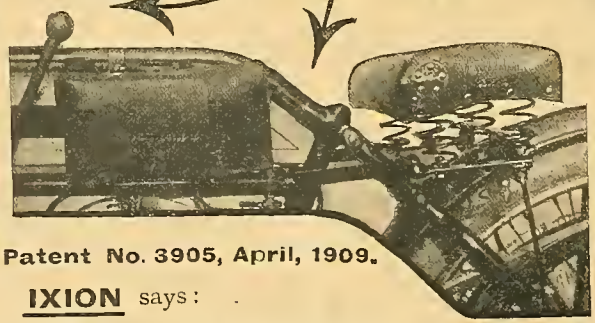
THE DEVASTATING MUD TRAPPED AT LAST!

June, 1914.

Dear Sirs,—It is with pleasure I have to record the efficiency of Waigh's patent Front-wheel Mud-Shields you fitted in March to my 6 h.p. "A.J.S." with sidecar.

I find them thoroughly practical and efficient in keeping both mud and dust off the rider. The one and only drawback to my mount (1913) was the fearful mess I got in when riding in bad weather at speed. Both driver and passenger were liberally sprinkled, but that is now a thing of the past. The guards (Waigh's) really do guard; not even my boots get splashed now, whereas in the old days you could not see them for mud. Incidentally, one can now enter a friend's house after a ride in bad weather with a clear conscience and clean boots, a not inconsiderable advantage the guards give. Yours faithfully,

A. UPSON J.P., Maidenhead.



Patent No. 3905, April, 1909.

IXION says:

"They are quite extraordinarily comfortable."

THE PASSING OF A MOTHER *is a sad event, BUT ALL THINGS DO CHANGE. For 15 years the CHILD—the motor-BICYCLE—has been devoted. It is now in its young manhood—the MOTOR-bicycle with vigour and endurance hitherto unknown to the world. It is BRITISH to the core, but poor. Its mother could bequeath it only two things—perfect BOOTS and a robust FRAME. It stands UNCLOTHED a prey to every storm and the tar-man. We have watched its development for the last 5 years under the guardianship of the A.C.U. in a hundred trials under awful climatic conditions training it to Herculean manhood. It but requires the clothes of preservation and the trappings of usefulness to make it the MOTOR-bicycle CAR to go anywhere, at any time and do anything.*

A WARNING. *Let us be thankful for the ROBUST FRAME. Don't abuse it. Already it has been cut away at the back to make room for an antiquated pedal-cycle saddle to get a low-riding position. AND NOW the frame is threatened with further weakening by springing by introducing a multitude of working parts and weight. All this can be carried out through the seat springing and a new method of riding — KNEE-GRIP-SEAT — A NEW METHOD APPLIED TO COPE WITH NEW REQUIREMENTS of great pace and vibration. ALL MUST FEEL SORRY FOR THE MOTHER—the PEDAL-CYCLE-SADDLE. BUT ALL THINGS DO CHANGE.*

THESE PATENTS FITTED TO YOUR MACHINE WILL **SAVE YOUR WAR TAXES**

Sidecar Driving in Ireland.—

exchange places with my brother, who seemed remarkably calm and cool, and quite unaffected by the indelicate titles conferred upon us by unfortunate people who had suffered inconvenience on our account. Accordingly I stopped the engine and proceeded to give minute instructions about the various little eccentricities of this terrible piece of mechanism before entrusting myself to the care of an "amateur," for by this time I considered that I was qualified to dictate to anyone on the subject of sidecar driving, regardless of the fact that my worthy brother is a practical engineer and could drive a car almost as soon as I could walk.

Owing to the liberal amount of luggage in the shape of suit cases, petrol tins, funnels, etc., which was stowed in the sidecar, the passenger was obliged to sit with his feet projecting over the end of the body-work, but a fair amount of comfort was possible even in this position, and I lay back and smoked peacefully as the telegraph poles flashed by in a continuous and hurried procession.

The Charms of Glengarriff.

The route which we had planned was through Ballincollig, Innishannon, and Bandon to Dunmanway, at which point a halt was called for the purpose of replenishing "the inner man" and the petrol tank. Up to this point the road had been exceedingly pretty but not really exceptional; however, after about an hour's run Bantry Bay came in sight, and we then turned north to Glengarriff, where we found the most charming spot I have ever seen. Honeymoon couples were in great evidence, and I cannot imagine a more delightful place for a holiday than this little town situated in the Bay, and enclosed by the Caha Mountains on one side and the sea on the other.

The charms of this spot nearly overcame us, for we were sadly tempted to stay there instead of proceeding on our way; but, after the refreshing influence of a bathe and a good meal, we decided to continue our journey and set out across the mountains towards Kenmare. No difficulty was experienced in taking the steep gradient which lay before us, but I must own that I felt somewhat apprehensive when some two miles from Releagh we arrived at a point where the mountain appeared to rise perpendicularly to a height of about eighty feet above us; and the idea of climbing this precipice with a single gear, which at the best was not a low one, seemed to me an impossible task. On rounding a sharp bend, however, we discovered a tunnel cut through the side of the hill, and after the dazzling sunshine to which we had become accustomed the gloom of this subterranean passage made a curious contrast, it being no easy task to steer a straight course towards the small gleam of light ahead which marked the exit.

Kenmare in Darkness.

From this point the day's hill-climbing practically ceased, and an easy run for about ten miles brought us into Kenmare, where we decided to halt for the night.

In this town the electric lighting is run by water power, but owing to the drought previous to the time of our visit, the entire place was deprived of its customary light, and candles or oil lamps were in great demand. The effect of this method of lighting contrasted curiously with the brilliant illuminations to which one so naturally becomes accustomed, and it was amusing to find that the chief ironmongery store relied entirely upon the dismal efforts of a single tallow candle for the double purpose of exterior and interior lighting.

A Cow in a Hardware Shop.

I have mentioned this particular store as it was the only one which I patronised, and also because of an incident which happened on the threshold. I was about to enter the doorway when an apparition loomed up in front of me, and I found myself *vis-à-vis* with a well proportioned cow, which, regardless of the ordinary rules of etiquette, forced its way through the door and compelled me to retire to a respectful distance whilst it contemplated in which direction it should take its evening stroll. I have since heard that it is customary in many parts of Ireland to allow animals free access to any of the dwelling rooms, but at the time I was much surprised at the proceeding.

Fortunately, this experience did not affect my slumbers that night, and after an early bathe in the Kenmare river next morning, we again set out. The weather was perfect, and as we picked our way along the mountainous road which runs beside the river, through Parknasilla and Sneem, it seemed difficult to believe that parts of this same island should be in such a critical state of unrest. From Caherdaniel we turned northwards to Waterville, at which town we had decided to lunch; and, as we reached the summit of the hill overlooking the valley in which this little place is situated we obtained a wonderful view of Lough Currane on the east and Ballinskellig Bay on the west, as the ground dividing the two is scarcely threequarters of a mile across.

Again replenished, we took the steep hill out of Waterville at a speed which evidently astonished the natives, and proceeded by a kind of loose bridle path to Cahirciveen, where we were obliged to stop for the purpose of tightening up the various nuts and bolts which had been shaken loose by the terrible state of the road just traversed.

Dingle Bay and Killarney.

Our route now lay on the south side of Dingle Bay through Glenbeigh to Killorglin, at which point we turned eastwards to Killarney, and arrived at that renowned watering place just before dark.

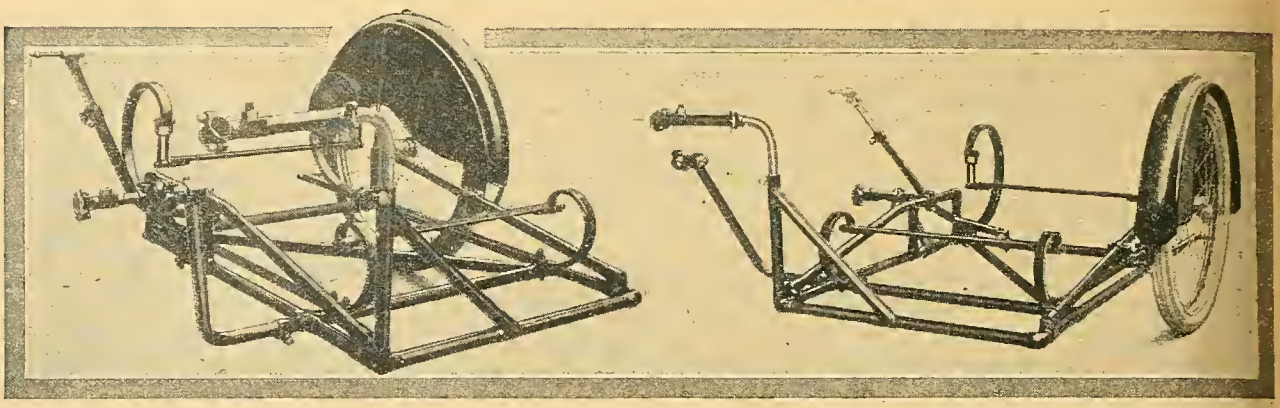
There is no doubt that Lough Leane deserves all the praise which the poets have thrust upon it, but Killarney town does not appeal to me as an ideal spot, and I was not loth to set out again next morning.

Up to this point we had been extremely fortunate in every way, but a flat tyre on the sidecar wheel announced the beginning of a day of woe, and between Killarney and Fermoy we managed to collect punctures in each tyre. This delayed our progress considerably, and we therefore curtailed our tour by turning south to Cork instead of taking in Lismore and Youghal as we had previously intended.

The total distance covered in the three days was practically three hundred miles, and there is no doubt that it would be difficult to find a more picturesque trip than this little corner of Ireland afforded.

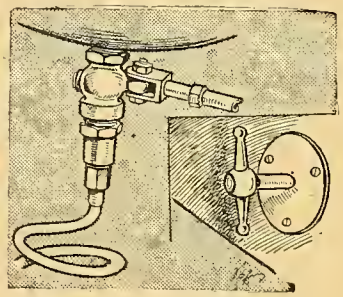
H.B.E.

The New Dunhill Sidecar.



A sturdy design of sidecar chassis by Alfred Dunhill. Ltd

MESSRS. DUNHILL, LTD., have lately introduced a new form of sidecar chassis, which is specially designed to be attached to a powerful motor bicycle. A glance at the photographs will show that the girder form of frame construction is employed wherever possible, and that immense strength and rigidity have been obtained thereby. Especially noteworthy are the duplex stayed side members, the diagonal tube which runs from one end to the other of the main frame, and the strong stays supporting the pillar carrying the attachment to the down tube. Particular care has been exercised in designing the method of attachment of the mudguard, which, it will be noticed, is valanced as fully as possible, and is attached direct to the frame at four points, consequently there should be no trouble with the stays becoming strained and breaking. Another interesting feature is the provision of long shackles at the rear of the C springs, which render the riding comfortable and easy. The particular type illustrated is the first model turned out, and future models will be even an improvement upon this.



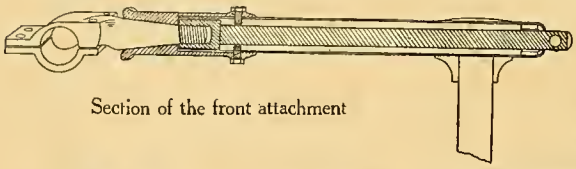
Petrol tap operated from the dash of a Morgan. On cycle cars it is often necessary to dive under the dash to turn off the petrol This is a neat alternative.

A lighter model will also be supplied, which has a three-point instead of a four-point suspension, which is intended for the lighter types of machines, and this particular sidecar will fit the spring frame Indian

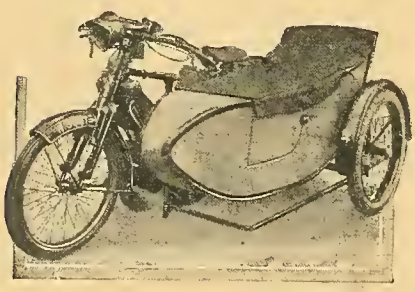
It will also be apparent from the illustration that the attachment to the chain stays is adjustable laterally. Altogether we were exceedingly well pleased with the design, and consider it to be one of the most practical we have yet seen.

A Lever Spring Sidecar.

THE Henderson sidecars are made in several patterns for 1915. We illustrate Model D. No C springs are used in this chassis, but a registered design of lever springing, adjustable for height, with coil springs (also adjustable). The great advantage of this type of springing is the entire absence of roll. Coil springs are also employed in front. The body can be made to turn up in front to enable the rider to get at the left side of the engine without detaching the whole sidecar; also an interchangeable sidecarrier body can be fitted. The chassis is constructed of straight tubes throughout, and carried out at the rear to form a luggage grid.



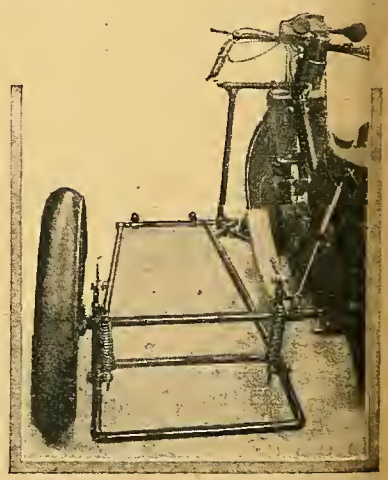
Section of the front attachment



Henderson sidecar attached to a Scott

Model A is specially made for lightweight machines, and Models D and B are also made to fit the spring frame Indian.

The method of fixing the front of the chassis will be clearly understood by reference to the accompanying line drawing. It will be noticed that the securing nut is attached to a rod which runs through the frame and is operated by a tommy-bar. It is so arranged that the shoulder of the lock-nut bears upon the set-screws before it is quite unscrewed, thus forcing the cone out of the tapered sleeve.



Chassis of new Henderson sidecar Model D, showing methods of springing and attachment.

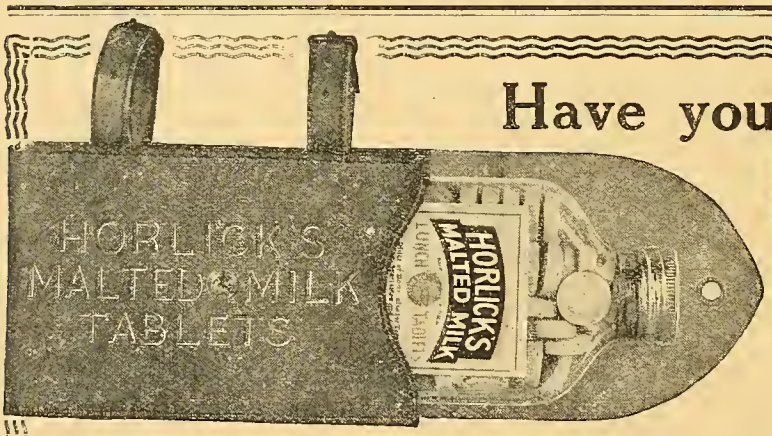
London Showrooms—57, Holborn Viaduct, E.C., and 157-158, Sloane Street (by Sloane Square), S.W.



Have you one of HORLICK'S CYCLE CASES attached to your machine?

May be attached to handle-bars or frame by means of the two neat straps. Actual size of case closed is 3¼in. by 5in. by 1¼in. deep.

Horlick's Malted Milk Tablets need no introduction to "The Motor Cycle" readers. These nourishing, invigorating, and sustaining food confections should be carried at all times, as they render one independent of delayed or hasty meals. The case illustrated above is made of strong leather, light brown in colour, and exactly fits a flask of Tablets. It can be easily attached to the frame or handle-bars of a motor cycle by the two leather straps, and the flask can be readily removed without dismounting.

IS YOUR FRIEND AN ARMY MOTOR CYCLIST?
IF SO, SEND HIM A CASE AND FLASK OF TABLETS.

Prices: Case and Flask complete, 2/6. Cases separately, 1/6 each. Flasks of Tablets, 1/- each.
And in Sterilised Glass Bottles, from which these may be refilled, 1/6, 2/6 and 11/-, at all Chemists and Stores.

Send Postal Order to—HORLICK'S MALTED MILK CO., SLOUGH, BUCKS.

Liberal Sample of Horlick's Malted Milk Tablets sent post free for 3d. in stamps.

Question & Replie

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Depreciation.

Q. Would you be kind enough to give me some idea as to what percentage should be allowed for yearly depreciation of a motor cycle? I might add this is my first year as a motor cyclist, during which time I have been a very interested reader of your paper.—J.H.K.

A. The best idea can be obtained from our advertisement columns. It is impossible to give any definite percentage, because the depreciation varies so enormously in different makes. For example, a first-class machine would only depreciate £10 in one year, while a machine with a lesser reputation will depreciate probably double that amount.

Acetylene Lamps.

Q. Could you or any of your readers kindly inform me of the pressure of gas in an ordinary motor cycle acetylene gas generator when it is giving best results and fitted with a standard burner? What is the pressure of gas required for the standard burner for acetylene gas lamps for motor cycles?—D.D.G.A.

A. The pressure in an ordinary generator cannot exceed three inches of water, namely, about 1¾ ounces to the square inch, in excess of the atmospheric pressure, otherwise the gas blows off through the water. An acetylene gas burner works at a little more than atmospheric pressure.

Taxation and Registration.

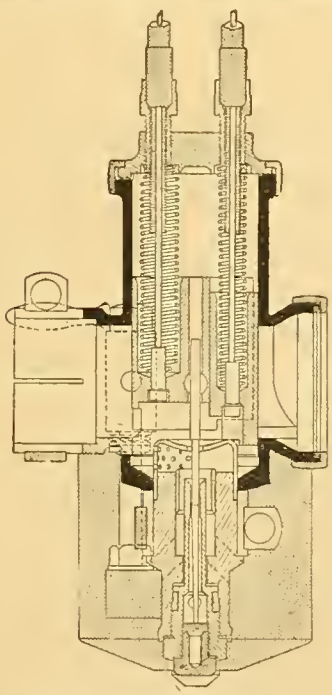
Q. I paid the £1 registration fee for my sidecar combination at the beginning of the year. I have now exchanged it for an A.C. Sociable, and on applying for new numbers for the A.C., the L.C.C. require me to pay another £1. Is this right? I thought the A.C., being a three-wheeler, would be covered by the sidecar registration fee, and, if not, that, anyhow, it would only be half-fee to the end of the year.—C.H.W.

A. You are confusing the local taxation licence with the registration fee. The £1 paid for your sidecar combination is the local taxation licence, and if you have got rid of this machine it entitles you still to keep a motor vehicle for which the licence is the same until December 31st. The registration fee for your sidecar combination was only 5s., but the registration fee for the three-wheeler is £1, as it weighs over 3 cwt. A registration fee is paid once only for each machine. The other tax is payable yearly.

How to Remove the Cylinder.

Q. Would you kindly inform me the best way to take off the cylinder of a 1910 Ariel? I have removed the exhaust pipe, plug, compression tap, and carburetter, and still I cannot get it over the piston. Will the engine have to be removed from the frame?—J.P.

A. We think that if you make sure that the piston is at the bottom of its stroke, lift the cylinder slightly, and rock it either backwards or forwards according to the position which will give a sufficient amount of clearance, you will be able to lift it off completely. There should be no necessity for you to remove the engine.



Sectional drawing of 1915 model B. & B. carburetter, a feature of which is the pilot jet, which is seen (partly dotted) on the left side of the carburetter. *(Described in "The Motor Cycle" of Oct. 29th, page 494.)*

Flames from the Exhaust.

Q. When I am running, my machine seems to pull well; but there is a constant fire in the silencer, and the flames jut out of the perforations fully an inch long. I feel sure this must mean extra petrol consumption. I shall be most pleased if you can tell me of a remedy for this fault.—W.P.

A. If you remove the exhaust pipe from any machine it is no uncommon thing to find a flame six inches long issuing from the exhaust ports. A red-hot silencer is usually an indication that the exhaust valves require grinding in, or that the spark is too much retarded.

Leave Well Alone.

Q. I have decided to take my motor bicycle to pieces. Would you kindly tell me what is the best thing to do with it? I have just taken the wheels out. Do you think I will have to take the engine down? I have let all the air out of the tyres; ought I to take the covers off, or will they keep all right as they are?—SUNSET.

A. The best thing you can do with the tyres is to pump them up again, and hang the wheels on a wall in a dark and fairly cool place. By all means take the engine down if you think it requires it, but you do not say why you wish to take the machine to pieces, unless it is for a general overhaul. It is generally best to leave well alone. If you decide to dismantle your machine, first arm yourself with copies of our handbooks.

Bad Hill-climbing.

Q. I have a 3 h.p. Rover motor cycle. It is an old machine with accumulator ignition, plain coil, and 1913 B. and B. carburetter. I can get forty miles per hour out of the machine on the level with ease, but it slows up at the slightest hill, and the majority of hills it refuses to climb. I have tried several sized jets, but with no success. I had new piston rings some time ago, but the compression is weak after having given the rings time to grind in. All the ignition wires are new. Also, could I fit an adjustable or variable pulley without and mechanical alterations?—C.F.B.

A. We should say that you have too high a gear, but possibly the trouble may be due to weak valve springs. These require to be renewed occasionally. There is no reason why an adjustable pulley should not be fitted to your machine.

Oil in Carburetter.

I have a two-stroke engine, and when it has been standing two or three days it blows back through the carburetter a few times before it will start; then, when it gets away, I have no more trouble that day. I have replaced the sparking plug for a new one and cleaned the carburetter. What do you think is the cause?—J.W.

The trouble you mention is not uncommon, and you will probably find that a simple cure will be either to drain your float chamber when you come in from a run, or to turn off your petrol about a quarter of a mile before reaching home, so that the float chamber is emptied. The cause of the trouble is usually that the petrol in the float chamber evaporates, leaving a layer of oil, which is inclined to choke the jets on starting up, but disappears in a few minutes. This, of course, only applies to engines lubricated on the petroil system.

Carburetter Adjustment.

My carburetter is a B. and B. with variable jet. When I start the machine, as the carburetter is now set, I have to put the air valve on about the same as the throttle; but when the machine has got under way it will not take more air according to the extra opening of throttle—that is, I work the control levers about level, or equal. My question therefore is: Should not the throttle lift control the necessary air, both for starting and normal running, without using the air valve at all? If so, what should I do to adjust the throttle to do this? Does it mean that I have the needle too high? I have no engineer to whom I can apply for proper adjustment advice, and with my present petrol consumption I fear I am not getting the best results. —J.P.

There is not much wrong with the adjustment of your carburetter, but if you wish to be able to use more air you should raise the needle slightly. This carburetter is only supposed to be automatic up to about 14-20 miles per hour. Beyond these speeds the air lever should be operated as required. It would, of course, be possible to fix the air and throttle slides together, and so operate them with one lever, but personally we should not be inclined to do this.

Top Speed Running.

By retarding the magneto almost to vanishing point, I can keep on top gear and still go slowly (5 or 6 m.p.h.) without knocking, either on the level or in traffic. Is this harmful to the engine (gears 4.9, 8.2, and 13.7), or should I change down to 8.2? I have ridden 4,000 miles (3,000 of this with sidecar). Would you advise putting in a new spring link for safety, even though the existing one is not much worn? The chain is a Renold $\frac{5}{8}$in. × $\frac{3}{8}$in. Is there much chance of this chain breaking before 10,000 miles, having stood the test so far? Which is more likely to prevent "pocketing" of valves—truing up valves on lathe, or grinding them in with rough compound and finishing with fine? Which do you recommend?—L.T.

So long as the engine does not labour or overheat, there is no harm in continuing on top gear, but, personally, we should prefer to change down. We should imagine that the ignition is on the slow side. A new spring link is unnecessary if the rivets are not worn or loose. The chain should not break at any time, but it will, of course, gradually stretch until the proper pitch is lost and a new chain is required. Pocketing is best prevented by truing the valves up on a lathe; they can afterwards be finished in the engine with a fine compound.

THE LADIES' MOTOR CYCLE CLUB OF SOUTH AUSTRALIA.

(5-6 h.p. Clyno and sidecar).	(2 h.p. Humber).	(5-6 h.p. Clyno and sidecar).	(2¾ h.p. Douglas).

Improving an Engine.

I have been engaged in fitting caps to the gear cover bushes of my 1912 f.e. Triumph, and I seek your assistance. When the maker fitted these oilproof bushes this year they deemed it necessary to fit a release pipe to allow the oil to blow through into the gear case as before. I am afraid the aluminium is too thin for me to fit such a pipe, but if I tried a small one, $\frac{1}{8}$in. diameter, *(a)* Would this be large enough? *(b)* would burring over the end suffice to hold it firmly in the aluminium? *(c)* Do you think such a pipe is advisable or essential? *(d)* Would it be satisfactory to plug up the oil ducts to the crank case and lubricate with graphite grease or thick oil through the tappet guides about every 2,000 miles when cleaning the cylinder? *(e)* Since I had the connecting rod rebushed and a new piston fitted last May, the engine, especially at the beginning of a ride or working hard up stiff hills, occasionally catches now and again as if suffering a momentary seizure. Personally, I am quite unable to account for the hitch and it is far too momentary and occur too early in a run to be a seizure of any kind. *(f)* Is shellac or seccotine on a brown paper washer the best preventive of oil oozing from the timing case cover joint?—B.T.V.

(a) A $\frac{1}{4}$in. bore for this pipe would be on the small side, but it might be worth while trying the effect of running without any such fitting, which could do no harm though the effect should be watched to see if it causes oil leakage elsewhere. *(b)* Burring the end of the pipe would be a doubtful solution to the matter if you wish to fit the device. We would suggest that you cut a fine thread on the pipe and screw it into the aluminium. Great care should be taken not to overscrew, as a fine thread in an aluminium casting would strip very easily. *(c)* We do not believe that such a pipe is essential, though there is probably some reason for the maker fitting it. *(d)* We should not advise you to plug up the oil ducts to the crank case as it is infinitely better to lubricate with a comparatively thin engine oil, which reaches all bearings more satisfactorily. *(e)* The catching you mention sounds as though it were due to some form of pre-ignition; possibly there is some slight roughness on the new piston head, or more likely you have changed your make of sparking plug, thus causing pre-ignition due to red hot points. *(f)* Seecotine or boiled linseed oil and brown paper will be found the most satisfactory job.

EXPERIENCES WANTED.

"A.B." (Edinburgh).—Morgan Run about. Skidding, vibration, ease of starting, slow running on high gear, wear of tyres, and general comfort.

"F.H." (Holmfirth). — Philipson and Grado pulleys on two-speed sidecar combination.

"J.B." (Ayrshire).—Brough horizontal twin with two-speed gear. Wearing qualities, silence, reliability, speed, consumption, hill-climbing, and general capability.

ZENITH

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 24th, must be closed for press earlier than usual. All copy and instructions for paragraph advertisements in that issue must therefore be in our hands not later than first post on Thursday, Dec. 17th.

PRICES.

ADVERTISEMENTS in these columns First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

INDIAN 1915 Models; earliest deliverics; ca change, or easy payments.—Best terms Elce and Co., 15, Bishopsgate Av., Camomile St

INDIAN, 1914, special model; list price £80, soiled; £70.—The Exeter Motor Cycle and Car Co., Ltd., 7, Bath Rd., Exeter, and 28, Ta Rd., Plymouth.

1914 Indian Combination, electric lighting outfi cover, all accessories, everything in perfe dition; owner gone to the front; price £55.— Mills Motors, Ltd., 4, Wood Side Parade, North ley. 'Phone: 1745 Fiachley.

1913 Special Tourist Trophy Racing Indian, single-cyl., 2 speeds, low, light, very fas used for T.T. race, purchased October 23rd, 191 Indian showrooms, as new; £35, near offer.—4, wark Park Rd., Bermondsey, London.

INDIANS.—Several standard 1914 models, speeds and free engine, cost £70, price ne £62 each to clear; also a good second-hand co tion, 1914, fitted with de luxe coachbuilt sidec —Wauchope's, 9, Shoe Lane, London.

1914 7h.p. Hendee Special and Gloria s electric equipment, speedometer, usual sories, little used, cost £103, accept £65; 191 T.T. Indian, F.E., speedometer, lamp, generat full tool kit, only run 2,000, accept £42/10.— Bambers, Liverpool Rd., Birkdale, Southport.

Indomitable.

INDOMITABLE, 3½h.p., water-tight Bosch, B., fast, good; £11.—Slater, 1, Wood's Lane,

Ivy.

1914 4¼h.p. Ivy-Precision, less than 2,000, a £32, close offer.—Breeze, 96, Victoria Rd., shot.

4h.p. Twin Ivy-Precision, Bosch mag., Dualop Brooks saddle, Stunmey-Archer 3-speed gear, horn, etc., purchased May, not used since July; joined forces; £29 cash.—Box L6,587, *The Moto* Offices, 20, Tudor St., E.C.

Ixion.

1914 Ixion, 2-stroke, 2½h.p. Villiers, braa offers.—Wigfall, Hillsbro, Sheffield.

James.

JAMES 1915 Models; earliest deliveries; ca change, or easy payments.—Best terms fro and Co., 15, Bishopsgate Av., Camomile St., E.C.

JAMES, 1914, 4¼h.p., and Canoelet sidecar, tion excellent, just overhauled by James Co. or near offer.—Gilburt, Audrey House, Ely Place don, E.C.

JAMES 3½h.p. T.T. Twin, July, 1914, done fast and powerful, Cowey, Klaxon, Lucas lene, accessories; owner going on military service or new T.T. Douglas and cash £4.—Hippisley Lodge, Sidcup, Kent.

J.A.P.

4h.p. J.A.P., overhead valves, Bosch, B. a Saxon forks, Chater frame, good order; £1 change considered.—Carter, 17, Webster St., heys, Manchester.

Clubs and Affiliation in War Time.

FOR some time we have expected that an announcement would be made by the Royal Automobile Club and the Auto Cycle Union with regard to the question of affiliation in 1915.

It is the experience of practically every club that its ranks have been seriously depleted by the call to arms of the King and country, that hardly any competitions are being held, that nobody is touring, and consequently the attractions and benefits to be derived from affiliation with the governing bodies are no longer an inducement to join. Special circumstances call for special arrangements to meet them, and we feel sure that the parent societies, the R.A.C. and the A.C.U., are just as much alive to the conditions obtaining in the motor world at the present moment as are the various constituent club executives, as each has so many individual members at the Front or undergoing military training. Quite apart from the fact that practically no club management would ever dream of exacting the yearly subscription from its members who are serving at the Front, there is also the fact that the membership of a club would be unlikely to be maintained while the war lasts.

But there is a much more serious side to the question than this. It is the experience of a number of clubs that a good many members who may not be serving their country are resigning membership evidently in the spirit of economy. This action may not be wholly attributed to the war, and, consequently, to prevent an extension of the resignations, it seems to us only right that the R.A.C. and A.C.U. should come forward with some new sympathetic scheme to tide over the period of hostilities.

Many clubs exist on the proceeds of successful competitions, but, in view of the fact that competitions are cancelled for the time being, a good many clubs without bank balances are being hard hit. We have already explained that the privileges of affiliation and associateship of the governing bodies no longer form an attraction, and, as the benefits to be derived from associateship are no longer needed, it would seem only right that an announcement should be forthcoming to relieve club executives of the anxieties of an inactive period beset with liabilities. The only alternative will be that clubs will be forced to cancel their affiliation with the governing bodies and release themselves from liabilities, and such an action would be deplorable from every point of view, as it would mean that the great federation of clubs which has been so carefully and laboriously built up would be destroyed or so weakened that recovery would be very difficult if not impossible.

Our Increasing Exports.

ONE of the most refreshing items of news to the motor cycle world in particular and the country generally is the great increase in the exports of British motor cycles and parts during November as compared with the corresponding month of 1913. The value of machines and parts exported in November, 1913, was £87,549 as compared with £95,233 for November, 1914. If anything were needed to indicate the present healthy state of the industry and Overseas markets, surely these figures would suffice.

EXPORTS OF MOTOR CYCLES AND PARTS.

July, 1914	£125,860
August, 1914	£77,121
September, 1914	£63,875
October, 1914	£84,474
November, 1914	£95,233

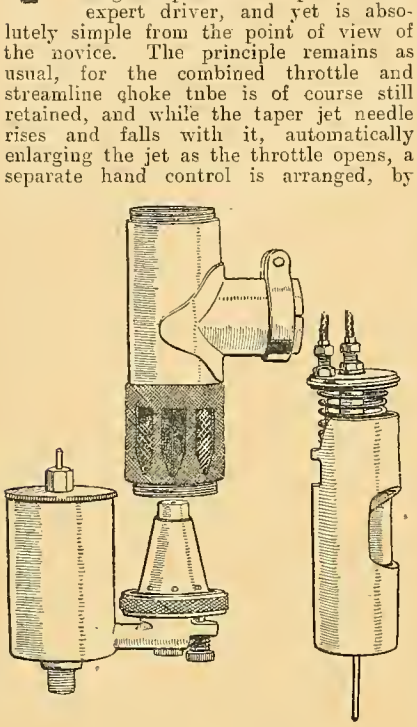
The steady recovery will not escape the observant.

In October trade generally brightened up; people were becoming used to war conditions, firms adopted the motto "carry on," and the motor trade showed a considerable improvement. Let us hope that it may continue to improve whatever the length of the war.

CARBURETTER DESIGN IN 1915.

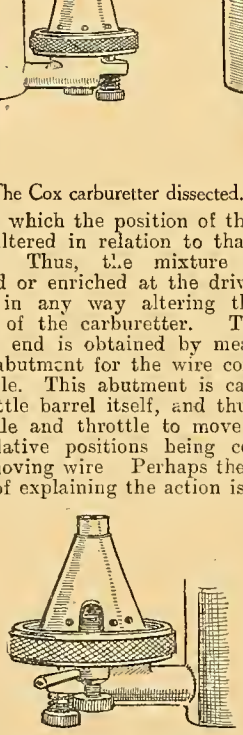
The Cox Streamline.

THE latest form of Cox streamline carburetter should give the largest possible scope to the expert driver, and yet is absolutely simple from the point of view of the novice. The principle remains as usual, for the combined throttle and streamline choke tube is of course still retained, and while the taper jet needle rises and falls with it, automatically enlarging the jet as the throttle opens, a separate hand control is arranged, by



The Cox carburetter dissected.

means of which the position of the needle can be altered in relation to that of the throttle. Thus, the mixture can be weakened or enriched at the driver's will without in any way altering the automaticity of the carburetter. This very desirable end is obtained by means of a moving abutment for the wire controlling the needle. This abutment is carried on the throttle barrel itself, and thus causes the needle and throttle to move as one, their relative positions being controlled by the moving wire. Perhaps the clearest method of explaining the action is to state



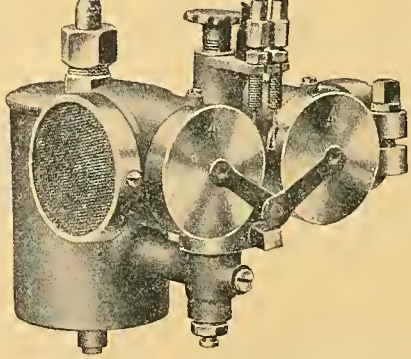
Air cone and throttle stop of Cox carburetter.

that though a movement of the throttle lever always controls the needle position, yet the needle may be moved by its control lever without affecting the throttle.

The main air holes consist of specially shaped slots around the body of the carburetter covered with a gauze sleeve, these slots being gradually uncovered by the rise of the throttle barrel. A refinement is introduced by the fitting of a small screw in the base, by means of which the throttle can be kept from shutting fully, so that the engine will remain just ticking over when running light. A second milled edge screw provides a very fine adjustment for the bottom air holes.

A New Model Everest Carburetter.

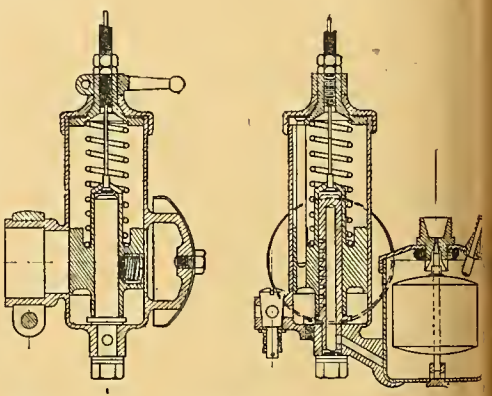
ONE of the first automatic motor cycle carburetters manufactured by Mr. Everest was offered to us for trial, and after being fitted and tuned up to a 6 h.p. single-geared motor cycle underwent a season's hard work on the road. So satisfied were we with the results, both as regards flexibility and petrol consumption, that our next machine (a three-speed twin with sidecar) was at once fitted with a similar device. The results were astonishing, for an engine that would either race or stop when running light was converted to a tractable power unit which would tick over or roar away at a touch of the single lever. All this was obtained without sacrificing petrol consumption; in fact, the best mileage we ever obtained from this particular mount was obtained with the carburetter in question. In its latest form the carburetter is modified in detail only, the action being similar. The throttle barrel and jet cover are now made in one piece, and the spring saddle which keeps the cover petrol-tight has been considerably simplified. The top of the body is now arranged so that it can only be replaced correctly, and a single pin, instead of two, connects the barrel with the air adjusting lever. Thus the whole mechanism has been simplified, and a very neat refinement, consisting of an additional fine air adjustment for slow running, has been added. This consists of a small tap at the base of the body, which can be clearly seen in the sectional drawing.



The B.S.A carburetter is one of the best known two lever devices. Among its many strong points are the quickly adjustable jet orifice, its top feed float chamber, and the special arrangement of throttle and air barrels which cause the incoming air to pass over the jet in the most efficient manner in every position of the levers

The float chamber now has a top feed and can be swung about the centre of the body so as to obtain the most suitable position. A very neat form of dust shield is attached to the body by a single screw. It is interesting to note that the jet outlets are drilled in a special manner, so as to prevent choking the actual jet, though small in diameter being so short that there is little chance of any obstruction lodging therein. Readers of *The Motor Cycle* will remember that the principle of the carburetter is very simple, for a movement of the single lever raises the combined throttle and air valve, and gradually uncovers a series of suitably spaced orifices in the central jet body.

The Everest Automatic Carburetter 12, Paradise Street, Coventry, are the makers of this instrument.

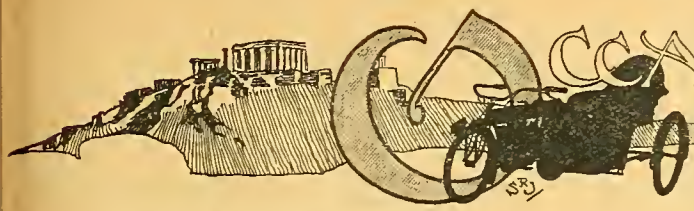


Sectional views of the Everest.

The Senspray with Pilot Jet.

THE Senspray carburetter has always been noted for its speed-giving properties, but, hitherto, some unskilled riders have found it difficult to get their engines to run really steadily at slow speeds. The new pilot jet arrangement, which we described on the 3rd inst., should prove a boon to such riders, and enable them to get that quiet tick over which is so useful.

New Senspray carburetter with pilot jet attachment. Below is an enlarged view of the pilot jet on which screws a cone for air adjustment.



OCCASIONAL COMMENTS

BY "IXION"

Graphite and Ball Bearings.

A good many riders are employing Oildag (which contains deflocculated graphite) for engines fitted with ball bearings, and many drivers of cycle cars are employing lubricants of, roughly, similar constituents for gear boxes with ball bearings. There is a persistent rumour abroad to the effect that graphite is utterly deleterious to ball bearings. I have tackled two or three technicians of my acquaintance without securing an authoritative verdict. Will Mr. Brooker or some other expert on lubrication kindly clear the air for us?

A Good Oilskin.

Some years ago I announced my complete conversion to the use of oilskins. I coquetted timidly with them during the reign of shapeless black jackets and yellow drain pipe trousers; but I fell an easy victim when I first encountered the light grey, green, and fawn oilies emanating from the house of Barbour at South Shields. Since when I have worn no others. I am now using a Barbour jacket which was purchased early in 1913 and is still stormproof. The original leggings, I regret to say, have gone the way of all waterproof leggings, *i.e.*, they caught on the corner of the rear number plate during a hurried mount inspired by a loose bull. If only some genius would invent an "oily" as unwearable as a rubber belt! In other respects, the Barbour stuff is absolutely "it."

Silence.

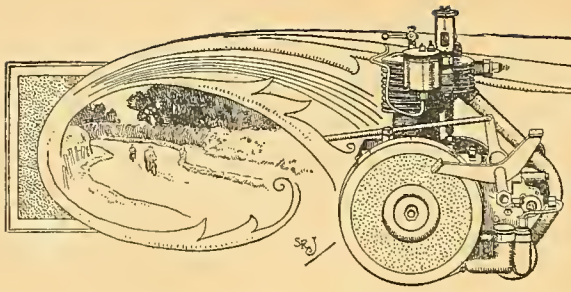
I see my old friend, B. H. Davies, is being sternly taken to task by some of our readers for omitting to press more efficient silencers on the trade. The omission is, if I remember rightly, prominent in each of his annual "letters to the trade," and I am probably at one with the bulk of our readers in commending the omission. Here and there one meets a rider who uses his machine mainly to increase the diameter of an area surrounding his home in which he can commune with Nature. Now and again the most hardened speed merchant resents the raucous rattle of his exhaust when he is traversing alone some gorgeous landscape which breathes a spirit of peace. Then the landscape seems to be wounded and insulted, not only by the clatter of an engine, but even by the smell of its exhaust, for honeysuckle and charred lubricant go ill together. One might even feel in a sensitive mood that the mere presence of a hard technical invention grated on the whole tone of a lovely valley in autumn; and in such moods men may sigh for the silent odourless polished nickel 30 lb. motor cyclettes of H. G. Wells. Contrariwise, most of us use our machines for comparatively utilitarian purposes, threading our irritated way through crowded cities, dodging stupid cattle, waking drowsy vanmen; and for the bulk of our riding we want a machine that can be heard as it comes. Beyond question the standardisation of perfectly silent motor bicycles would send the traffic casualty list soaring up to formidable figures, until the public had learnt to rely more on their eyes and less on their ears for judging the safety of the streets and roads. No doubt in time the public will undergo the required education, and all motors will become noiseless; but it is essential that the process should be gradual. Nevertheless, Mr. Davies might reasonably have complained of the frightful noise emanating from some of the modern baby two-strokes; their exhaust is positively ear-splitting, and makes even a hardened offender like myself glance upwards, expecting to see a 100 h.p. seven-cylinder Gnome aeroplane engine in full blast. I wonder if the silence of the Scott machines had anything to do with their being selected for the machine gun batteries? But there—as Charles Jarrott once retorted to S. F. Edge's eulogy of the six-cylinder—does the "silence" of the modern motor ever amount to more than "*continuous* noise"?

The New Lodge Plug.

Any unfortunate wight afflicted with a "plug-eating" engine should try the new Lodge mica pattern. This present season brought me a couple of engines afflicted with such a colossal appetite for r.p.m. that a hard spell of work on one of the lower gears usually cost me one or more sparking plugs. Further, one of them appeared to imagine that the real function of the lubricating oil was to cool the top of the cylinder head, so that, if it did not burst its plug's insulator, it carborised up the electrodes. The Lodge directors must have suffered untold things with sister engines; at any rate, their new mica plug appears to be very reasonably leak and soot proof, several thousand miles having failed to wring the faintest semblance of a misfire from my sample set.

A Sideslip Test.

Arising out of an argument anent the liability of various types of machine to sideslip, I made some interesting experiments the other day. The roads outside were covered with a half-dried film of peculiarly atrocious grease. My capacious shed chanced to house a baby two-stroke, a 3½ h.p. with hub gear and belt drive, a 3½ h.p. with chain-cum-belt drive and countershaft gear, and a 7 h.p. chain-driven twin with 3in. tyres. I performed various evolutions on the worst greasy corners in the neighbourhood, riding each machine in turn. The evidence obtained was hardly conclusive, for I am more at home on two of the machines than on the others, and the hub-geared 3½ h.p. had rather worn treads. But I have no doubt in asserting that the "baby" was by far the safest and most docile of the quartette under the conditions, and that the big-tyred heavyweight took the most managing. Of the two medium weights I fancied very definitely that the hub-geared machine was the hardest to keep erect. The big twin ran very slowly, balanced nicely, and steered beautifully; but its somewhat broad and flabby tyres evinced a marked tendency to "skate."



Detachable and Interchangeable Wheels.

ANCIENT AND MODERN.

Second and concluding instalment. By ERIC W. WALFORD.

WHEN we come to consider modern constructions of detachable wheels designed for motor cycle work, it is not surprising to find that most of the important features are common to the old constructions produced for pedal cycles.

Probably one of the earliest motor cycle designs is that of the Clyno shown in fig. 1. Here the hub A is mounted

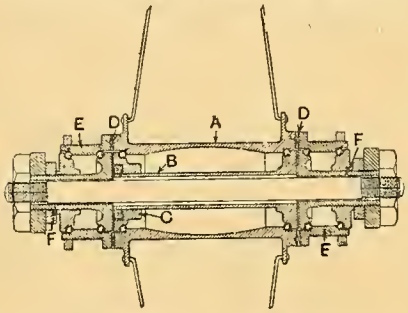


Fig. 1.—Lamb-Clyno.

upon bearings on a sleeve B. This is provided with a collar at the right-hand end which forms a ball cone, whilst an adjustable cone C screws on the other end. Each end of the hub is provided with dog clutch teeth or the equivalent at D, which gives it a driving connection with a short sleeve E. One of these sleeves carries the belt pulley, and the other the pedalling sprocket or brake drum. Each of these sleeves is mounted upon a small hollow spindle F, which resembles closely the part B. Passing through the parts F B F is a bolt, and by the removal of this the chain stays can be sprung slightly apart, disengaging the teeth at D and allowing the hub to drop out, leaving the two sleeves E supported, one from each fork end.

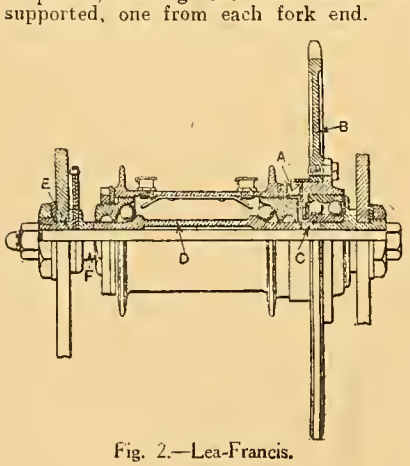

Fig. 2.—Lea-Francis.

The Lea and Francis construction, taken from their patent specification, is shown in fig. 2. Here again the hub shell is provided with dog clutch teeth at one end A, through which it receives its drive from the chain sprocket B. The sprocket is carried on bearings of its own on a short supporting hollow spindle C attached to the fork end; the hub bearings are mounted upon a sleeve D. Between this sleeve and a tubular nut E lies a distance piece F. Passing through the centre is a long bolt, and when this is removed the distance piece F can be withdrawn, allowing the hub to be moved to the left to disengage the clutch teeth A, which permits the hub to be removed. The distance piece F is attached to the nut E so that it cannot be lost, and is easily put into place.

One of the latest constructions is that of the Bradbury shown in fig. 3. The left hand end of the hub shell at A is formed of hexagon shape and fits into a corresponding hole in the centre of the chain sprocket, which provides the chain sprocket is carried on a short, hollow spindle B secured in the fork end by its own nut C. The hub bearings are

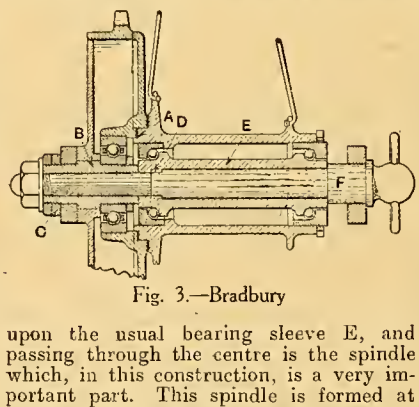

Fig. 3.—Bradbury

upon the usual bearing sleeve E, and passing through the centre is the spindle which, in this construction, is a very important part. This spindle is formed at D with flats which prevent rotation of the bearing sleeve E, and it is enlarged at F, this enlarged part performing somewhat the duties of the distance piece in the Lea and Francis construction. On unscrewing the spindle and drawing it out to the right the whole hub can be moved to the right to disengage the driving connection at A, when it is free to be removed, leaving the chain sprocket carried on the hollow spindle B.

In the A.J.S. construction, shown in fig. 4, a distance piece A is used as in the Lea and Francis, and also a bearing sleeve B, which carries the hub bearings. The spindle in this case is in two parts, the major part C, which is withdrawn when the hub is to be removed, and a minor part D, which remains in position and carries, on plain bearings, the chain sprocket. The driving connection between the sprocket and the hub shell consists of a number of pins E on the sprocket, which enter holes in the hub shell, whilst

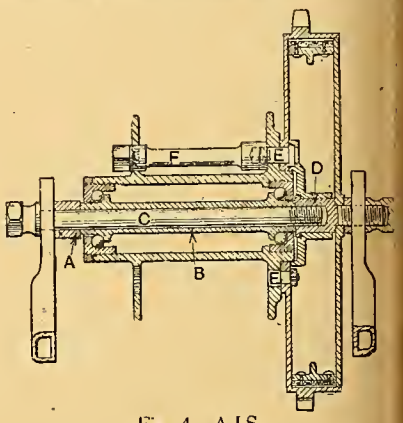

Fig. 4.—A.J.S.

one of the pins is screwed and is engaged by a long nut F, which, when screwed up, prevents any shake in the driving connection. In some of the other constructions some freedom of movement is purposely allowed in this driving connection to prevent binding in the bearings, which, in this instance, is prevented. One important point about this construction, in which a distance piece A is used is that on removing the spindle and the distance piece a space is left through which a tyre tube or cover can be passed so that it is not necessary to remove the wheel to change a tyre. The wheel at such times remains supported by the bolt F.

The Dene (fig. 5) also employs a two part spindle, the larger part A being re

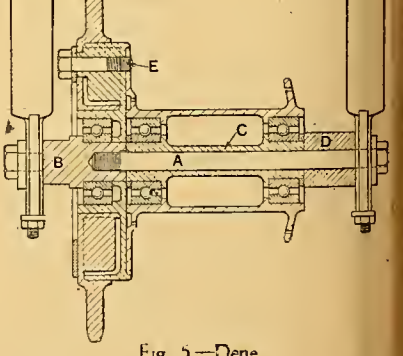

Fig. 5.—Dene.

tachable and Interchangeable Wheels.—
ovable and the smaller part B remain-
g in place. There is the usual bearing
eeve C and distance piece D. The
iving connection between the chain
rocket and the hub sbell is constituted
r the studs E which secure the chain
rocket. The chief feature of difference
tween this and other constructions is
at the bearings employed throughout
e of the "annular" type.

In the Humber system (fig. 6) the hub
ns on bearings on the usual bearing
eve A, and is connected with the chain
rocket by a dog clutch at B. At D
ere is a distance piece, and through
e centre passes the bolt E. By remov-
g this, and swinging the distance piece
ide, the hub can be drawn to the right
disengage the dog clutch teeth, and it
then removable. It will be noticed
at annular shields have been arranged
F to prevent lubricant being thrown
t through the space between the dog
tch teeth.

The Sunbeam construction (fig. 7) differs
m those previously described in employ-
g a spindle made up in three parts.
e right-hand part A carries on a pair
annular ball bearings the chain
rocket, the interior of which forms a
um for the expanding brake. This
llow spindle part is to all intents and
rposes a fixture. The centre spindle

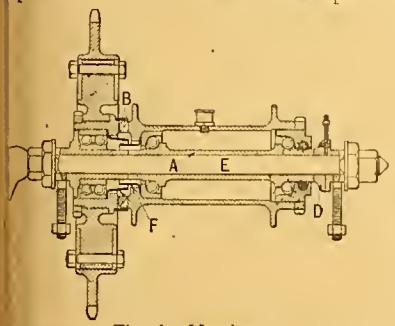

Fig. 6.—Humber.

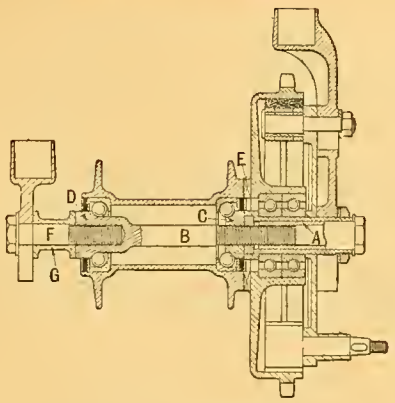

Fig. 7.—Sunbeam.

portion B screws into the hollow spindle. It carries at the right-hand end an adjustable cone C for the right-hand hub bearing, whilst the left-hand end is enlarged at D, and the outer surface is formed with a cone for the hub shell. This has a driving dog clutch connection at E with the sprocket. Screwing into the enlarged part D of the centre spindle is the left-hand spindle portion F, which is carried by the fork end. On this is a distance piece G. On removing the parts F and G a new cover or tube can be fitted without removing the wheel, whilst by removing the spindle parts B and F the wheel can be detached and interchanged with either the front or sidecar wheel.

In the Matchless construction (fig. 8) there are no loose parts beyond the spindle A. The hub shell is mounted on the usual bearing sleeve B, which is loose on the spindle. The chain sprocket runs on roller bearings C on a hollow spindle D attached to the left-hand fork end. The hub shell is connected with the chain sprocket through a dog clutch, the teeth of which are visible at E, and it will be clear that the hub shell must be moved to the right to disengage these clutch teeth. This is prevented by an enlargement F on the spindle, which corresponds in a sense to the distance piece used in the Lea and Francis construction, except that it is not loose, and to the enlarged spindle part in the Bradbury arrangement. The enlargement in this case is oblong, and when the left-hand spindle nut is removed and the spindle turned through a right angle by means of the short lever G the enlargement lies longitudinally with regard to the slotted fork end, and can pass through the fork and slots. Consequently, when the spindle is removed the distance piece F comes away attached to it. The hub shell is then moved to the right to disengage the clutch teeth, and is therefore detached without disturbing the chain wheel.

The shaft-driven F.N. has a special arrangement, which, after the brake and gear case have been partially disconnected, permits the wheel to be removed without touching the bearings.

It should be pointed out that the drawings of the Clyno, Lea and Francis, Bradbury, and A.J.S. constructions are taken from patent specifications and do not necessarily illustrate the actual constructions in use. It is quite possible that the latest constructions show improvements over the arrangements illustrated in the patent drawings.

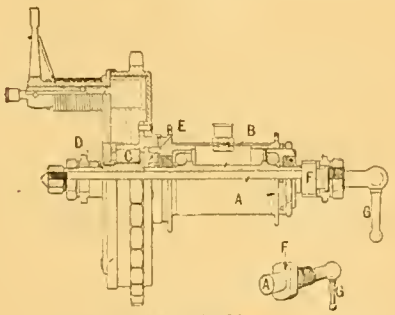

Fig. 8.—Matchless.

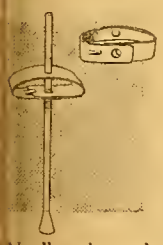
THE 1915 WALL AUTO-WHEEL.

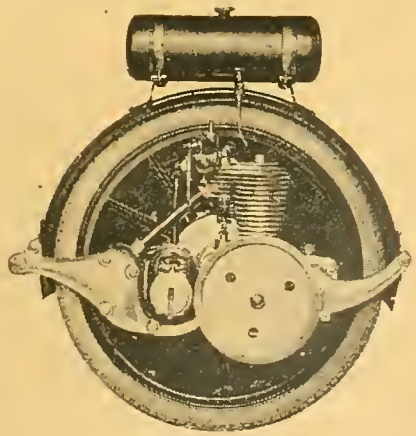
HE new Wall Auto-Wheel does not possess any startling improvements, but has been altered for the better in detail in one or two
itances. The lugs holding the crank
e on to the frame are now made of drop forgings instead of malleable iron, and greater strength is thereby obtained. A small but important improvement is shown in the accompanying illustration of the carburetter needle valve. In former models the float was kept in position by means of a split pin, which, however, did not allow of any adjustment in case of wear. Naturally, the needle valve wears its length of
ement is increased, and so the level of
petrol is altered. To overcome this
iculty a portion of the spindle of the needle is threaded, and over it there is a spring clip, consisting of a strip the ends of which are bent over and holes are drilled through. The holes in the bent-over portion are not concentric, and the spring tends to pull one piece against the other, thus forming a tight clamp, the threads, of course, serving to act as an anchorage.



Needle valve and
at chamber of the
ito-Wheel car-
retter.

We are enabled to illustrate the American Smith's motor wheel, which is manufactured in the United States under licence from the English Auto-Wheel Co. The device is fixed to the near side of the bicycle, is gear driven, and has a live axle, while it will be noticed that a disc wheel is fitted. There is no frame proper, the mudguards having supports attached to each end of the extremities of the base chamber, while the tank is fitted to the mudguard itself. The engine, like its English prototype, has an automatically operated inlet valve, but is provided with the well-known American Schebler carburetter.

It is interesting to note that a further improvement of the already ingenious system of lubrication in force in the Auto-Wheel will shortly be introduced, though the details are not ready to be made public at present.



Smith's motor wheel.

1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

THE LATEST RADCO MODEL.

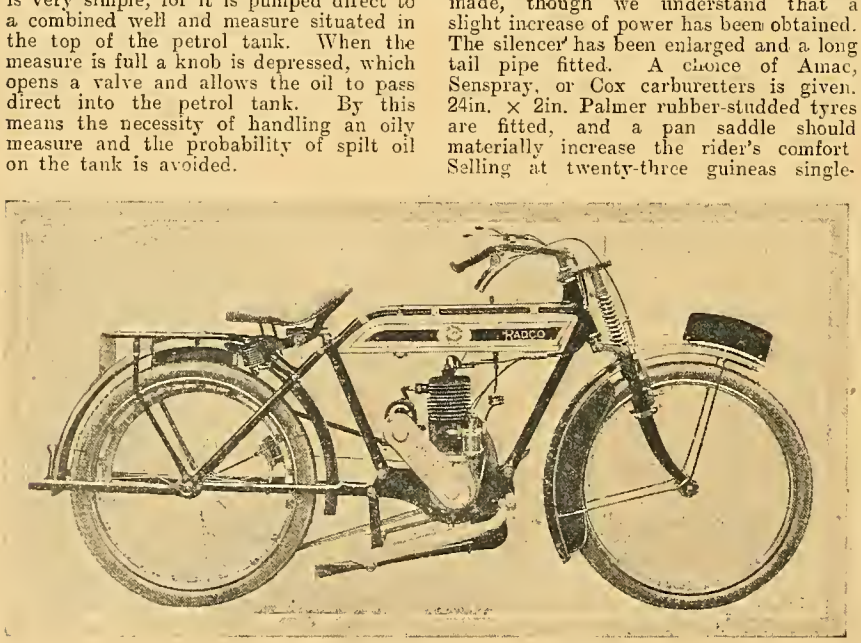
A GLANCE at the new 2¼ h.p. Radco is sufficient to show that considerable alterations have been made to the frame. Not only has the engine been dropped several inches, but a very much lower saddle position is obtained, partly by the dropped top tube, and partly by general design. The appearance has been improved by the change, and the machine is strikingly neat in its lines. The length of the head lug has been increased by one inch, which, besides affording easier steering, allows more motion in the spring forks. The forks are, of course, the Radco patent, giving an easy motion both vertically and horizontally. Frame fittings have been somewhat modified, the carrier being stronger, neater, and rigidly fixed to the rear guard. The number plate forms an additional point of attachment, and gives great rigidity. Besides this the rear stand clip has been improved, a very neat metal covered tool-bag fitted, and comfortable cast aluminium footboards can be supplied.

Injecting Oil into the Petrol.

The method of mixing the oil and petrol is very simple, for it is pumped direct to a combined well and measure situated in the top of the petrol tank. When the measure is full a knob is depressed, which opens a valve and allows the oil to pass direct into the petrol tank. By this means the necessity of handling an oily measure and the probability of spilt oil on the tank is avoided.

The engine has proved so satisfactory that practically no alterations have been made, though we understand that a slight increase of power has been obtained. The silencer has been enlarged and a long tail pipe fitted. A choice of Amac, Senspray, or Cox carburetters is given. 24in. × 2in. Palmer rubber-studded tyres are fitted, and a pan saddle should materially increase the rider's comfort. Selling at twenty-three guineas single-geared, or twenty-nine guineas if fitted with the Albion two-speed, the Radco is sure to attract an ever-increasing market, especially as the greasy roads and winter weather encourage a light handy type of machine, and such undoubtedly is the Radco.

Oiling arrangement on Radco, showing the plunger at the top of the oil measure.



The latest model 2¼ h.p. two-stroke Radco

EDITORIAL NOTE.

ALREADY many full descriptions of 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions were published:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Ahingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	22nd.	J.A.P. engines, Calthorpe, Lucas dynamo.
,,	29th.	Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2¼ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun Vitesse, and Levis.
,,	19th	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p. Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.
,,	26th.	Rudge, O.K. Junior, Wooler, New Imperial, J.H., Lady's Radco, Wulfruna, Bradbury, and Hazlewood.
Dec.	3rd.	Norton, Grandex, Connaught, Brown, Clyde, Brough, and Lady's Ivy.
,,	10th.	Allon two-stroke, Wulfruna, Premier two-stroke, O.K. two-stroke, A.J.S., and Velocette.

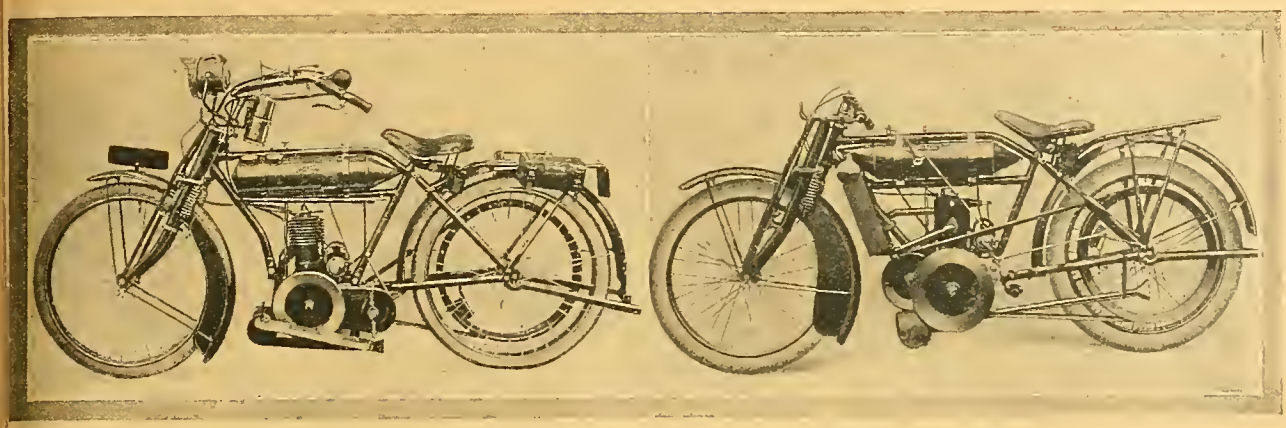
THE 1915 PARAGON.

THE Portway-Cooper Manufacturing Co. are a firm which pin their faith in the two-stroke engine. The machines are called the Paragon, and the first of the models to which we wish to draw attention is the 2¼ h.p. ladies' model, fitted with a Paragon two-stroke engine, 64 mm. × 70 mm. (= 235 c.c.). Lubrication is by the petroil system. The transmission is by combined belt and chain, the latter being adequately protected, while the two-speed gear box is attached to the counter-shaft. The pattern of the forks should be noted, since they are of the single type, and their design is somewhat of a departure from standard practice.

Another model is the 3 h.p. machine fitted with an engine of 73 mm. × 83 mm. (= 346 c.c.). Like the first-named, it is fitted with an outside flywheel. It will be noticed, however, that Druid sprung forks are provided. The gear is slightly different from that fitted to the ladies' model. It is of the double chain type operated by two gun metal expanding ring clutches, giving a direct drive on both gears. A kick-starter is also supplied.

A Water-cooled Two-stroke.

Then there is the 4 h.p. model, the engine of which is water-cooled; the cylinder dimensions are 84 mm. × 86 mm. (= 495 c.c.). It has an outside flywheel and is fitted with automatic lubrication



TYPICAL PARAGON TWO-STROKES. The 3 h.p. machine (left) and the 4 h.p. water-cooled model.

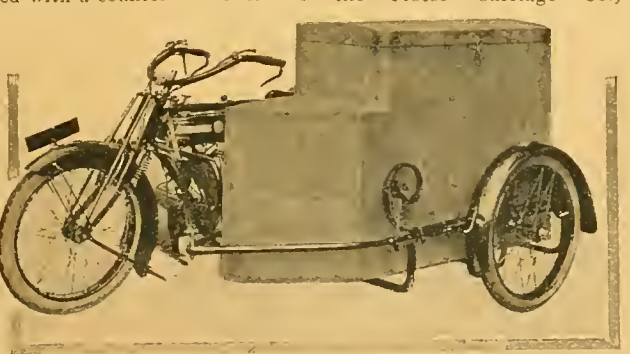
he oil being taken through suction from he sight feed lubricator to the side of the ylinder. A circular recess at the base f this distributes the oil on to the sur- ace of the piston, the surplus lubricant eing led through gutters to the main nd big end bearings. An auxiliary pump also fitted to give an extra supply of l when desired. The same type of two- peed gear is fitted as to the 3 h.p. achine, but the gear box is carried, in his case, in front of the engine instead f behind it. In every respect this model esembles the 3 h.p. machine, except, of ourse, as regards the fitting of water ooling. This is, as may be expected, ranged on thermo-syphon principle, a diator of the honeycomb type being nployed.

MODIFICATIONS ON THE NEW REX-JAPS.

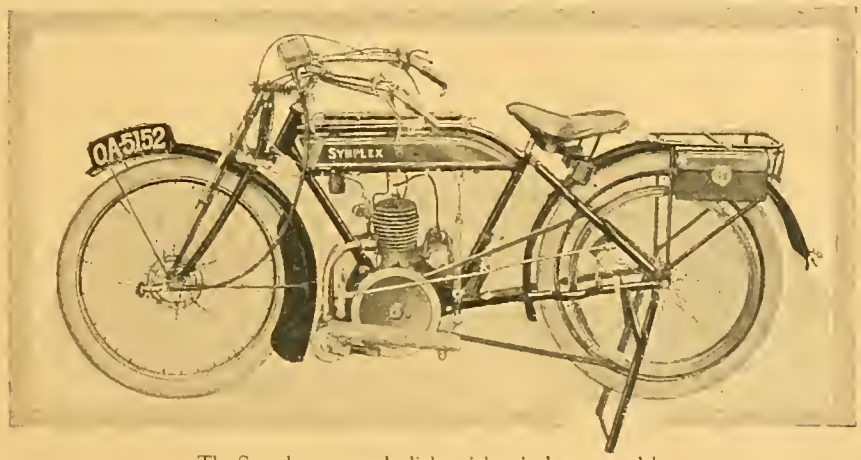
THE Premier Motor Co., Ltd., of Aston Road, Birmingham, are continuing, for 1915, the two models which they have listed ring the year now concluding. These e both twin-cylinder machines, being ted with 6 h.p. and 8 h.p. J.A.P. gines respectively. With the exception the engine both machines are abso- ely identical, and very few alterations ve been made, since the 1914 models ve given such satisfactory service.

Both machines are fitted with a counter- ft three-speed gear, closed chain drive, d kick starter. The r ratios are 4½, 8, d 13 to 1, but for commercial car- , which the manu- turers list, lower ios are recom- nded. The design the gear box cast- has been altered, that the kick rter is included in gear box instead working in a cket bolted to the me, as has hitherto n the practice fol- ed by the makers. other improvement connected with the change-speed is the operating lever, which now works in a gate with a positive stop for each gear. A larger plug for inserting oil is now fitted. Attention is also drawn to the strength of the steering head, which is made in one piece. Standard tyres are 650×65 Kempshalls, but 28in. × 3in. wheels are also fitted.

A commercial sidecarrier has been standardised. It has been made to the order of the Motor Carriage Co., Chichester Street, Belfast. The box body is 5ft. × 3ft. × 2ft., and is fitted with a lid on top and a door at the back.



One of a fleet of Rex-Jap commercial carriers for express delivery work in Belfast. Note how the body is cut away at the forward end to allow of free play for the handle-bars.



The Symplex two-stroke lightweight, single-gear model.

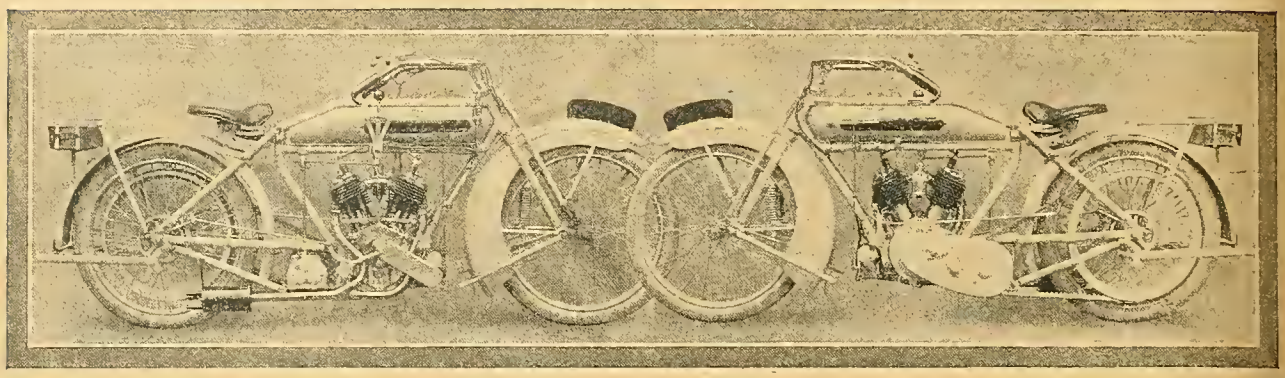
THE SYMPLEX LIGHT-WEIGHT.

THE Symplex two-stroke has many attractive features, and should prove a very popular model. The engine, which has a bore and stroke of 73×76 mm. (318 c.c.), is of the four-port type. The crankshaft is of large diameter (⅞in.), running in white metal bearings, and the piston is fitted with three rings. The U.H. magneto is placed on a platform cast with the crank case, and is chain driven. The lubrication is by the petroil system, or by direct feed to the cylinder wall, whence the oil runs to the main bearings. The spring forks are Brampton's Bi-flex. The tank is capable of holding one and a quarter gallons of petrol and two pints of oil. Hutchinson 26 × 2in. tyres are fitted, and a really comfortable saddle, viz., Brooks B180. The carburetter is an Amac.

The two-speed model is fitted with the Albion two-speed gear box, also, a three-speed gear and clutch can be supplied at an extra cost. The makers are the Symplex Motor Cycle Co., 150, Alma Street, Birmingham.

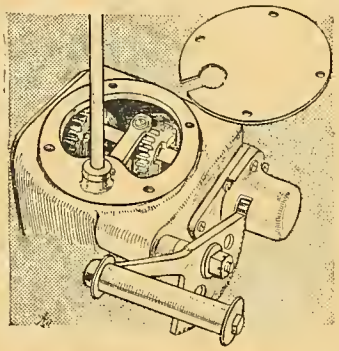
THE BAT IN 1915.

Machines of Handsome Appearance; Spring Frame Improvements.



Both sides of the new 4 h.p. twin-cylinder Bat. Drive is by chain to a three-speed countershaft gear and thence by belt.

WHILE there are no very startling changes in the 1915 Bat to record, there is progress noticeable which goes towards making, if possible, for greater comfort and reliability. There are three models, as follows: 4½-5 h.p., 70 mm. × 76 mm. (= 584 c.c.); 5-6 h.p., 76 mm. × 85 mm. (= 770 c.c.); and 7-8 h.p., 85 mm. × 85 mm. (= 964 c.c.) All have twin J.A.P. side-by-side valve engines. The two first models have chain and belt drive; the 7-8 h.p. is completely chain driven, the chains being enclosed.



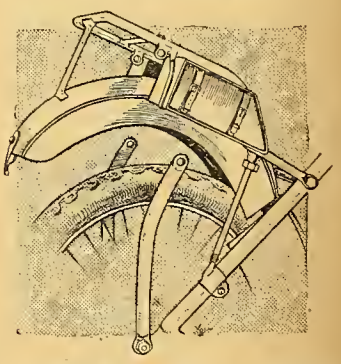
Bat three-speed gear box with cover removed. The location of the kick starter is also indicated.

The first point of interest in the two larger models is the spring frame, though the principle is one which has been in vogue for the past twelve years with the Bat Co. As now adapted, it gives a much easier movement, the saddle pillar moving as one with the footboards. The spring is fitted horizontally, one end fixed to the main frame, the other, by a lever, to the seat pillar, affording a lower saddle position. For a very heavy rider there are added two extra small springs from the top links to the frame.

Gear Improvements.

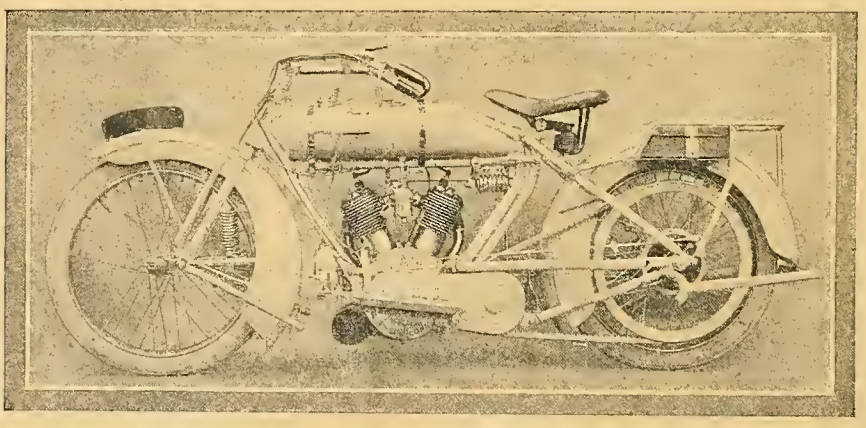
Another new feature is the adoption of a gate change for operating the three-speed gear. The gear is very substantial, being of the countershaft pattern. The gears of the first ratio are in mesh, the second slides on a square shaft, and the third is direct. The box is provided with a removable cover, which consists of a flat round plate secured by four screws. This is easily removed, and facilitates inspection when occasion arises for adjustment or alignment; thus the possibility of the wheels being only just in mesh (a fruitful cause of broken teeth) can easily be avoided by periodical examination.

The ratchet and quadrant kick starter is new; it actuates on the gear box shaft, with which it forms one unit.

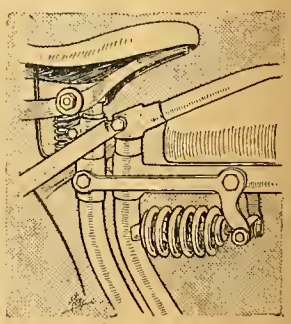


Mudguard and luggage carrier lifted up from tyre and held in position with bolt.

The efficient mudguarding of the back wheel—at the same time providing for ease of inspection of tyre and wheel—has been effectively accomplished by hingeing from the back stay the rear half of guard with which is combined the carrier. By the withdrawal of a bolt from the guard stays, the guard-carrier can be swung up clear of the wheel and dropped in such a position by



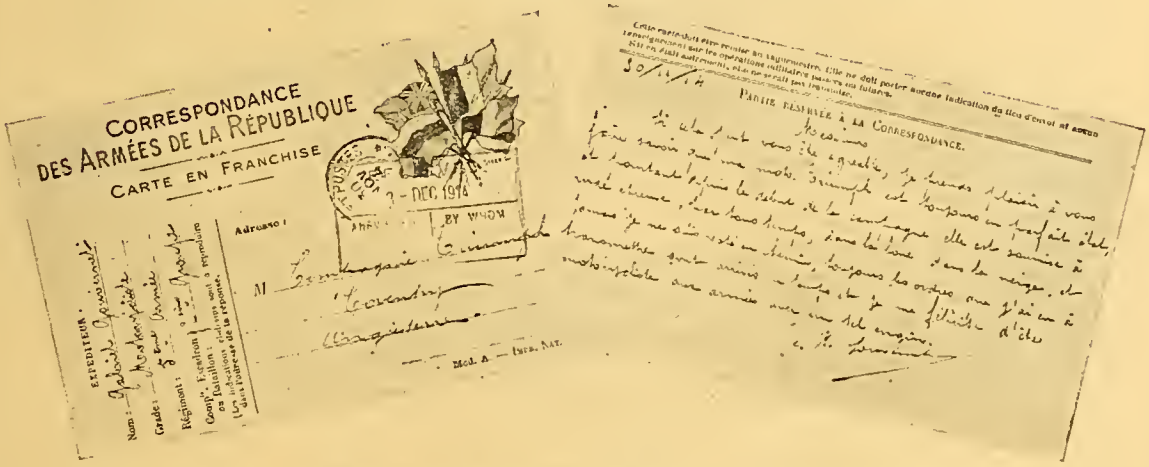
The 5-6 h.p. Bat showing springs fore and aft and chain-cum-belt drive through a three-speed countershaft gear.



New method of suspending seat pillar on the new Bat-Japs.

Always at the Front!

The Triumph "Four" does splendid work with our Allies



From the well-known French Competition Rider, M. Gabriel Gouvernet, now serving as Despatch Rider with the French Army.

"If it is agreeable to you, I have pleasure in letting you know that my Triumph motor is always in perfect condition, although since the beginning of the war it has been subjected to brutal tests in all weathers, in the mud and in the snow, and never have I been delayed on the road. I have been able to deliver all the despatches I have been called upon to carry in time, and I am happy to be a motor cyclist with the army with such an engine."

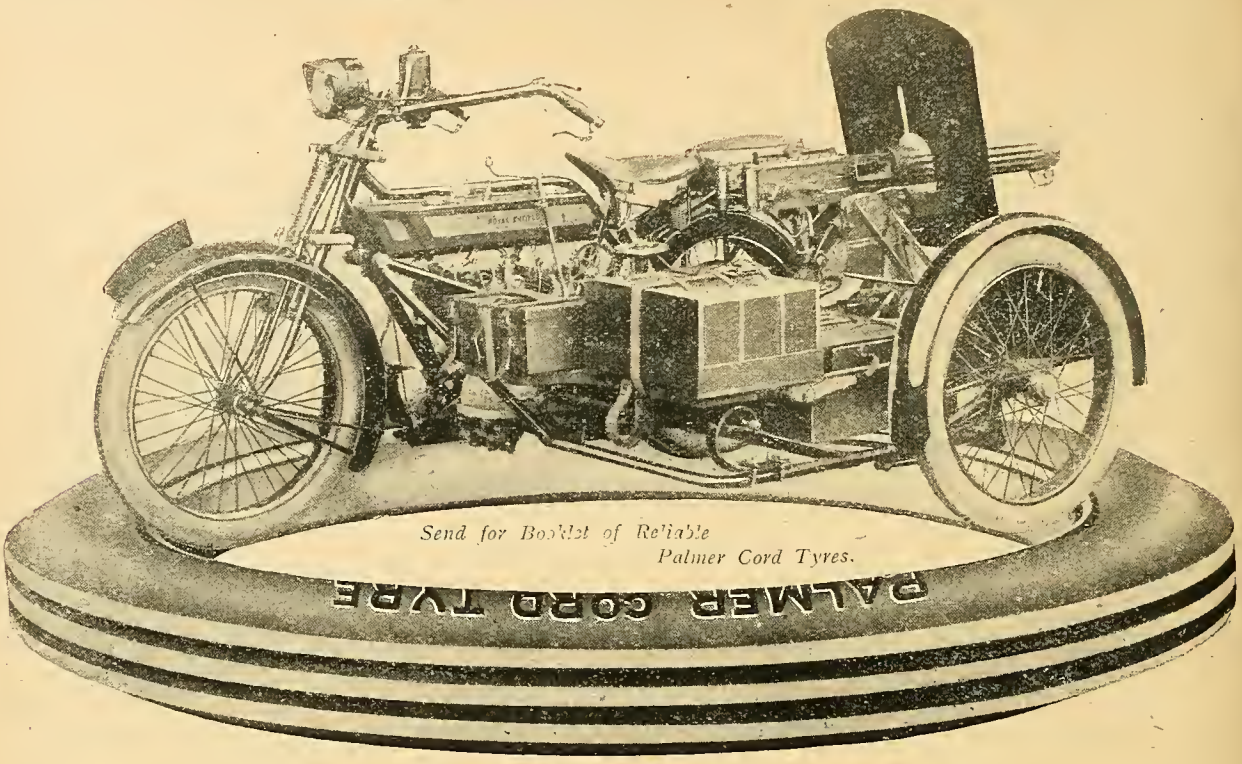
Another French Rider's Experience — M. Vormese.

"Where I am at present there is a large number of English, French, and Belgian motor cyclists, and notwithstanding the terrible paved roads my Triumph is going splendidly and without any trouble, after having covered some 25,000 kilometres (15,525 miles).

The speed gear acts admirably in spite of the bad treatment meted out to it. We follow the convoys at a speed of 3 to 9½ m.p.h., principally on low or middle gear."

Triumph Cycle Co., Ltd., Coventry.

TRIUMPH



THE Tyres for the Expeditionary Force.

THIS week we illustrate another Armoured Motor Cycle fitted with Palmer Cord Tyres.

This is one of a number of 6-8 h.p. machines supplied to the War Office, which are fitted with 26 x 3 in. Palmer Cord Tyres on the Back wheels, and 700 x 80 Palmer Cord Tyres on the Front and Sidecar wheels.

This is a war of petrol and rubber, and it is a distinct compliment to Palmers that they should have been selected above all other tyres for this strenuous work. If their performance under exacting competition tests, and their splendid behaviour at the Front are any criterion, Palmers should prove a valuable factor in bringing this war to a successful end.

PALMER

(ORIGINATORS OF THE THREE-RIB TREAD)

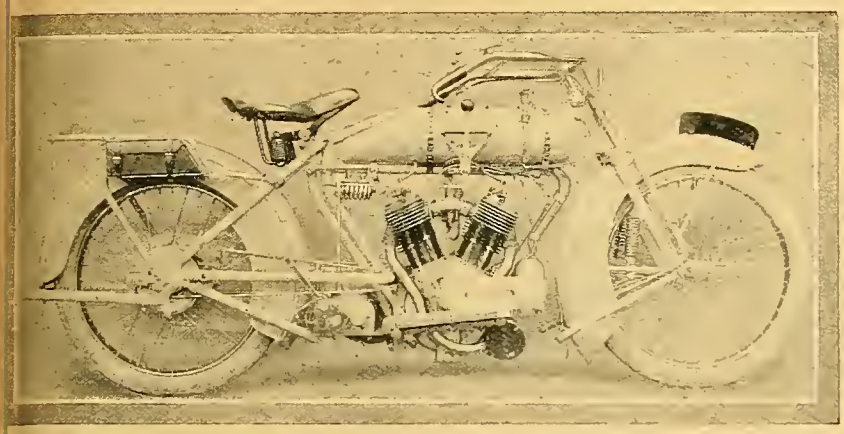
CORD TYRES

THE PALMER TYRE, LTD., 119, 121, 123, Shaftesbury Avenue, LONDON, W.C.

Motor Cycle Tyre and Repair Department—103, ST. JOHN STREET, CLERKENWELL, E.C.

'Phone: City 1485 and 1486 (2 lines). Telegrams: "Inwheeling, Smith, London."

In answering this advertisement it is desirable to mention "The Motor Cycle."



The big 8 h.p. twin-cylinder Bat. Like the 5-6 h.p. machine, both front and back are spring suspended. This model is chain driven throughout.

he bolt so removed being placed between arrier framework and back stay; thus o necessity arises for unloading the arrier when tyre repairs happen to be equired

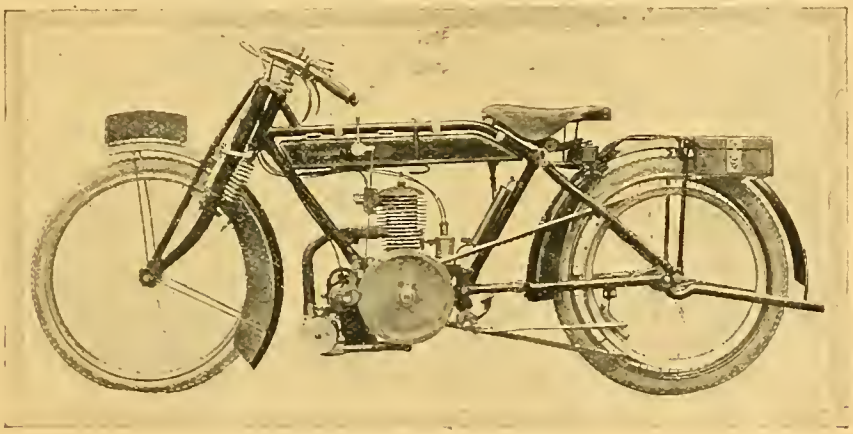
On each of 7-8 h.p. and 5-6 h.p. odels the back brake has been enlarged; herwise it is the same—external band nd internal expanding. The clutch is xpanding as formerly, *i.e.*, a phosphor ronze centre against hardened steel.

Amac carburetters and Kempshall yres are standard on all models.

It is interesting to recall that the akers of the Bat are one of the oldest anufacturing firms in the country, the at with the torpedo-shaped tank being s familiar to riders ten years ago as is to-day. What is of further interest, owever, is the fact that they have lways specialised on a spring frame, the esult being that what they do not know bout the suspension of motor cycles is ot worth knowing.

A NEW CONNAUGHT.

THE most striking feature of the 1915 Connaught programme is the introduction of a low-priced popular model, which is likely to ave a large sale owing to the excep- onal value offered. The bore and stroke emain as in previous and existing odels (73×70 mm.), but the engine is altered in many details. The cylinder fins are arranged to give the cylinder a pear-shaped appearance, and the inlet port is formed in the side of the cylinder instead of directly below the exhaust port, as is the usual Connaught practice.



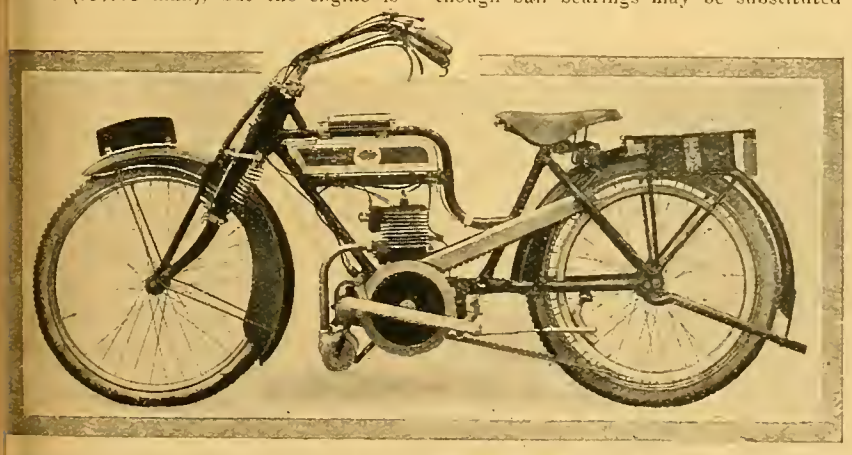
A new design Connaught sold at a low figure.

In addition to this, the transfer port leads from the crank case instead of through the piston. The crankshaft is fitted with phosphor bronze bearings, though ball bearings may be substituted at a slight extra charge. All models are now supplied with a cover to the release valve, which protects the rider from oily vapour.

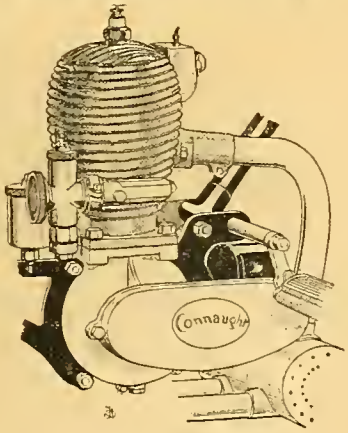
The engine is mounted in a frame having a dropped top tube, and this, in combination with the 24in. wheels, gives a very low saddle position. Girder forks are used, for, though the machine is light, it is not skimped, and is intended for a serious touring machine as well as for a runabout. A two-speed countershaft gear may be fitted as an extra, in which case a combination drive is employed, and a large oil measure is carried in a convenient position on the saddle tube. The new model sells at 25 guineas, and should command a large market among such as require a handy and reliable mount obtainable at a moderate outlay and capable of hard work.

A Ladies' Model.

Other Connaught models remain much on the lines of their predecessors. Ball bearings are fitted to the crankshaft, and a few detail improvements have been carried out which make the machines even more attractive. An improved heel brake has been arranged on all models, and a striking open frame type is now marketed for ladies' use. This is thoroughly well fitted up, and is a mount particularly adapted for the fair sex, having a belt guard and footplates.



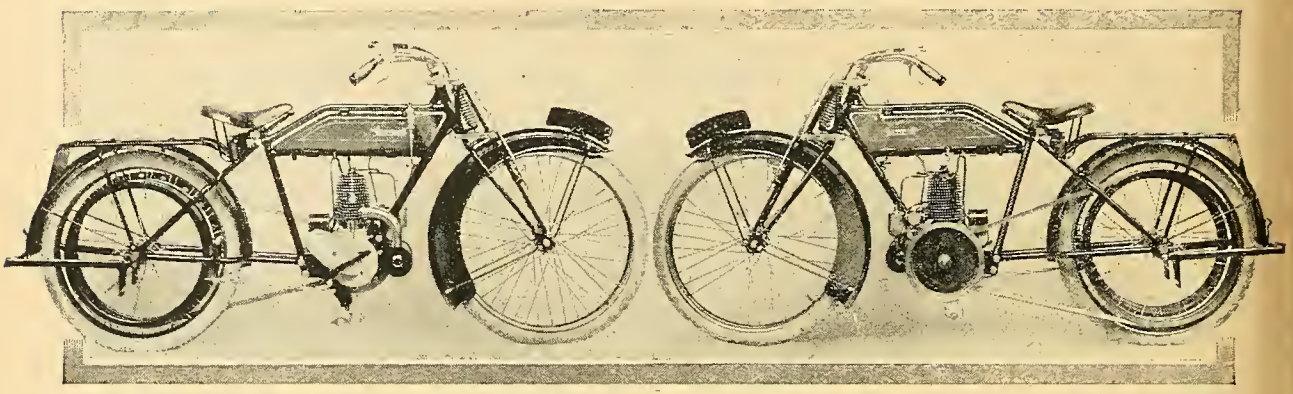
The lady's model Connaught, which, like all machines made by this firm, has a two-stroke engine.



Engine unit of new Connaught, showing position of ports.

A TWO-STROKE QUADRANT.

Long-stroke and a Mechanical Exhaust Valve.

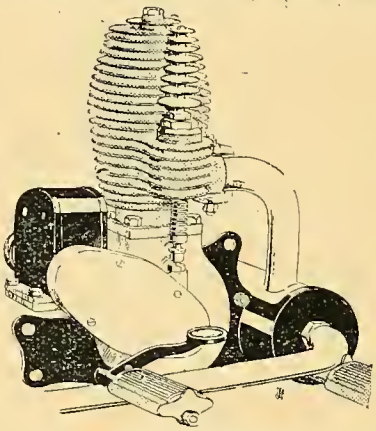


Both sides of the new two-stroke Quadrant.

THE name af Quadrant has of recent years been associated chiefly with machines of considerable size, the big 4½ h.p. single having earned a particularly good name for sidecar work. Consequently, it is interesting to note that the latest model to be added to the Quadrant list is a comparatively light two-stroke. The engine incorporates two unusual features, for its long stroke of 100 mm. against a bore of 70 mm. is distinctly uncommon in two-stroke design; while the most striking departure from standard practice is the fitting of a mechanically operated exhaust valve, which is timed to close at such a period as will prevent the escape of the incoming charge by way of the exhaust port.

In construction, the engine is somewhat similar to the usual type of three-port two-stroke, except that the exhaust port is set relatively high up as regards the piston travel. After passing through the usual port, the exhaust gases are controlled by the action of a mushroom exhaust valve operated by a cam on the crankshaft; thus on the upstroke the valve is timed to close before the incoming charge has time to pass out and so be wasted.

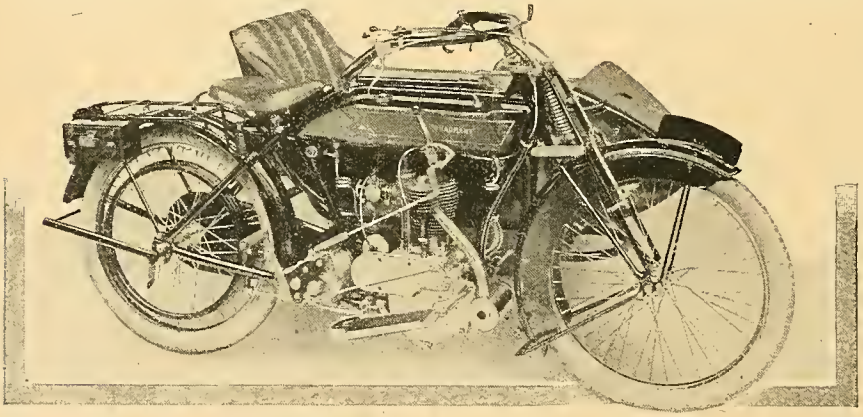
The lubrication is on the well principle, oil being fed from a sight feed drip to a well formed in the top of the crank case casting. Into this well the piston dips at the bottom of the stroke and carries oil up the cylinder walls. The surplus flows through ducts to the main shaft bearings, and thence through the drilled crankshaft to the big end. All bearings are plain, except for an additional ball race on the driving side. Behind the crank case a Dixie magneto is mounted and driven by a train of gears from the crankshaft. The arrangement of cylinder fins gives a distinctive appearance to the engine, and the exhaust valve cap is fitted with a copper cooling device, though experiments are being carried out with water-cooling for the exhaust port, as it is believed that this may increase the efficiency of the engine. The frame is a sound straightforward piece of work, and the fittings, which include Quadrant spring forks, excellent mudguards, and stout stand and carrier, are well carried out. 26in. × 2in. wheels are fitted.



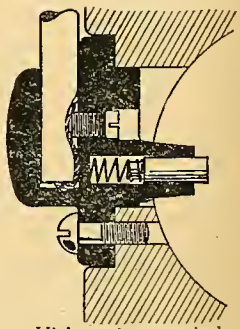
The Quadrant two-stroke engine. The exhaust valve and its special heat radiating cap will be noted.

The Big Single.

The big 4½ h.p. single-cylinder engine remains much as before, but the cycle to which it is fitted now carries a B.S.A. three-speed counter-shaft gear, and the chain drive is thoroughly enclosed throughout. The black finish of the machine is very handsome, and, with a comfortable sidecar, forms a most attractive proposition at a strictly moderate price.



The new single-cylinder Quadrant sidecar machine, the chief feature of which is the all enclosed chain-drive. It is a particularly well finished turn out.



High-tension terminal and carbon brush of the Thomson-Bennett twin-cylinder magneto.

THE 6 h.p. BRADBURY.

The makers of the Bradbury motor cycle inform us that when sending us particulars of their 1915 models for the Buyers' Guide they gave the wrong price for the 6 h.p. twin-cylinder. It should be seventy guineas.

Unequalled.

By Appointment.

ANGLO - AMERICAN
OIL COMPANY, Ltd.,
36-38, Queen Anne's Gate,
WESTMINSTER, S.W.

AGAIN! AND YET AGAIN!!

The success of the Sunbeam Chain Drive, which combines all the advantages of Belt or Chain Transmission, without the disadvantages of either, has again been demonstrated.

In the WEST AUSTRALIAN TOURIST TROPHY RACE
(October, 1914),

TWO SUNBEAMS STARTED

THEY FINISHED

FIRST AND SECOND

(out of a field of **26**)

Making FASTEST TIME and RECORD FOR THE COURSE (150 miles).

This, following the Team Prize in the 1914 English Tourist Trophy Race and many other victories, certifies to the Supremacy of the Sunbeam Transmission, and of every detail of the complete machine.

For Speed, Durability, Ease of Control, and Satisfaction under all conditions, nothing even approaches the Sunbeam.

Preliminary leaflet, giving detailed specification, will shortly be ready, and sent on application to

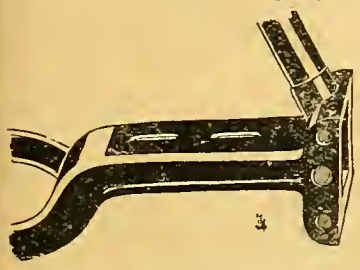
J. Marston, Ltd., 11, Sunbeamland, Wolverhampton.

London Showrooms—57, Holborn Viaduct, E.C., and 157-158, Sloane Street (close by Sloane Square), S.W.

A BIG TWIN EXCELSIOR.

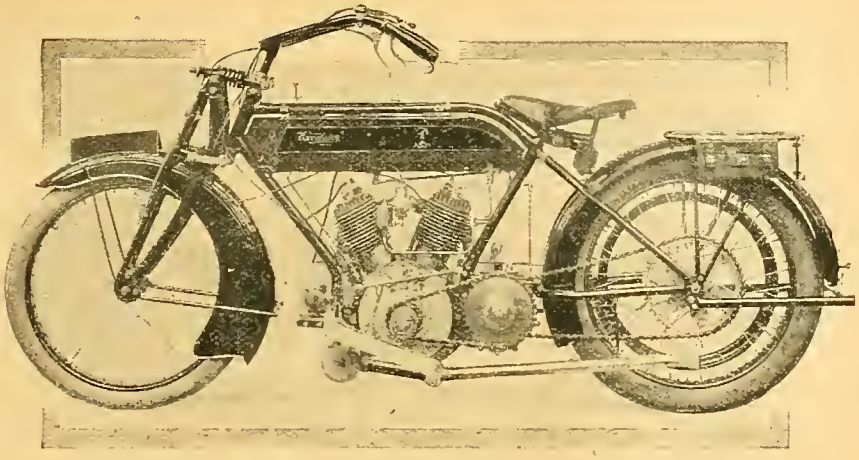
MESSRS. BAYLISS, THOMAS and Co., the producers of the well-known Excelsior, have become famous for their big single, but for 1915 they propose to market an 8 h.p. twin as an additional model. The general lines of the machine do not depart radically from the previous single-cylinder models; in fact, the frame is exactly the same, but a twin 85.5 × 85 side-by-side valve J.A.P. engine supplies the motive power. The drive throughout is by chain, the front chain being totally enclosed while the rear chain is amply protected by metal shields. The three-speed counter-shaft Jardine gear is well fitted to a steut bottom bracket, and the holding-down nuts are easily accessible for chain adjustment. This type of Jardine gear comprises an enclosed kick-starter and a large diameter cork insert clutch, while a shock absorber is fitted on the engine-shaft.

The engine is fed by an Everest automatic carburetter, which has been adopted after a year's trial on a single-cylinder



The powerfully constructed bottom bracket lug of the big twin Excelsior.

model, and oil is supplied through a Best and Lloyd semi-automatic drip feed lubricator. Not the least important item on a big twin is the tank capacity, and the Excelsior boasts a two-gallon petrol tank, with provision for half-a-gallon of lubricating oil, while a reliable petrol gauge is fitted in the top. Mudguards with deep and full valances are used, and, in combination with foot boards shielded in front and below by a neat underscreen, should keep the rider dry and clean.



Transmission side of the big twin-cylinder Excelsior. The chain cases are removed to show details of the drive.

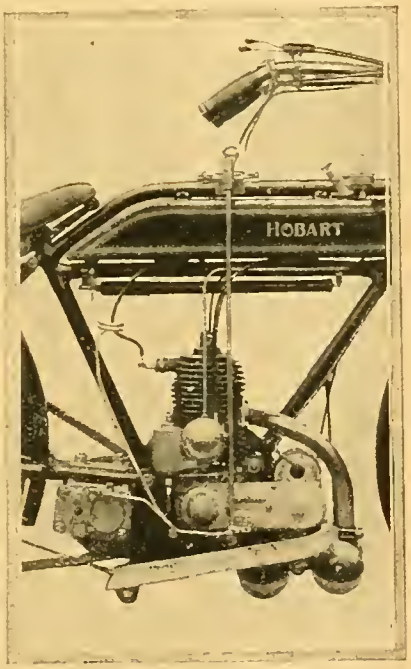
Sound Wheel Construction.

Brampton spring forks are included, and the rear brake acts on the internal V of a dummy brake rim so as to facilitate wheel removal.

The wheels themselves are fine pieces of work. Cycle car rims are used capable of taking either 2½in. or 3in. tyres, and ten-gauge spokes employed to attach them to the hubs, which are oil retaining and mud proof, and run on very large diameter ball races. The Splitdorf magneto will be carried in front of the engine, but protected by the footboard screen. Throughout, the fittings are very sturdy, and the machine looks a first-class heavy passenger vehicle and should make a good showing when trials once more come into vogue.

TWO-STROKE HOBART.

THE latest model Hobart two-stroke is a very much more complete machine than the previous baby lightweight, and is neat in appearance and workmanlike in design. The company has undergone some modification, and Mr. F. Starr, the present manager, is an enthusiastic motor cyclist, and one of the type who regularly uses the firm's products as well as undertaking the business part of the proposition. The new machine is fitted with the latest type of Villiers 70×70 mm. two-stroke engine, which drives through the medium



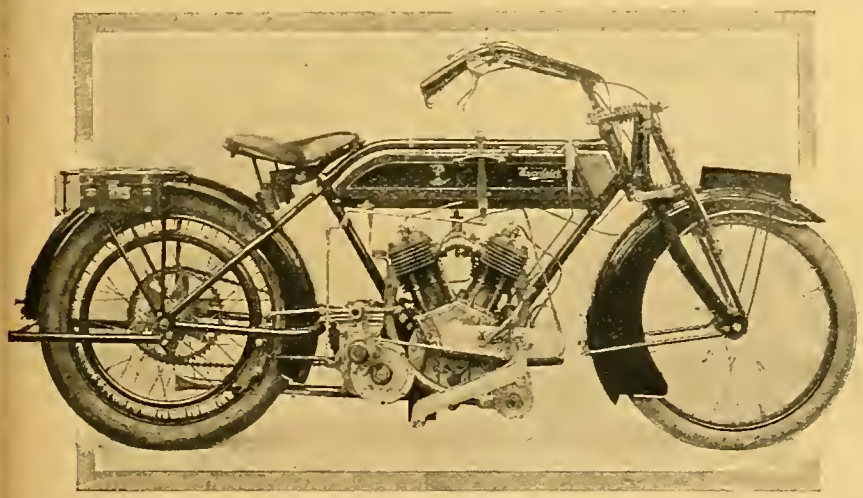
Power unit of the new two-stroke Hobart.

of a chain, and a Roc two-speed counter-shaft gear, though a single-geared model is obtainable.

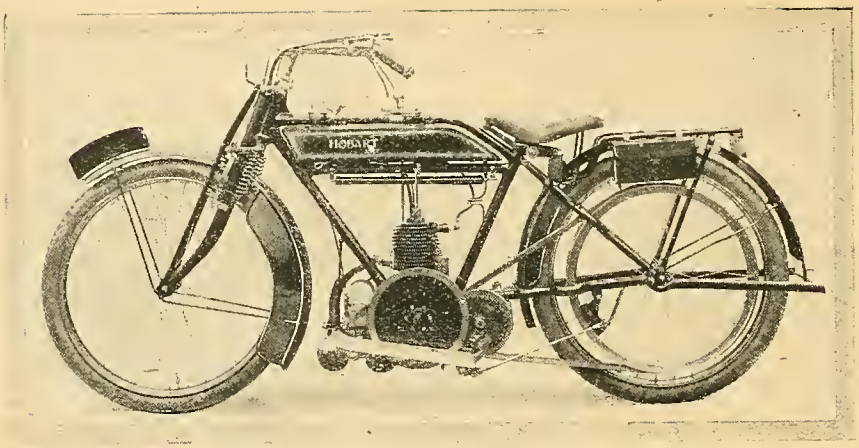
The engine is lubricated through a lead to the inlet pipe between the engine and the carburetter, the oil being fed by means of the latest pattern of Benton and Stone sight feed drip, which is fitted with a special device allowing a free flow of oil if desired.

Strong and Neat.

A very neat and substantial frame contains the power unit, and weight has not been cut down where strength is



First example of the new 8 h.p. twin-cylinder Excelsior.



The new two-stroke 1915 pattern Hobart from the transmission side, showing large flywheel and combination drive.

necessary, though the complete article scales well under 150 lb. Comfort has been carefully studied, and the pan saddle fitted is the result of practical experience, which proves that light machines are even more in need of such a device than heavy types. 26×2in. tyres are employed, and each mudguard is fitted with short side valances, the rider's feet being accommodated by long aluminium footboards. It is probable that an Everest carburetter will be standardised, as exceptional economy is claimed with this device, but at the time of writing the question has not been decided. Finished in black with a wide gold line on the tank, the machine is pleasing to the eye, and with an excellent equipment, including metal enclosed pannier tool bags, it is good value at 32 guineas. The single-geared model is listed at 27 guineas.

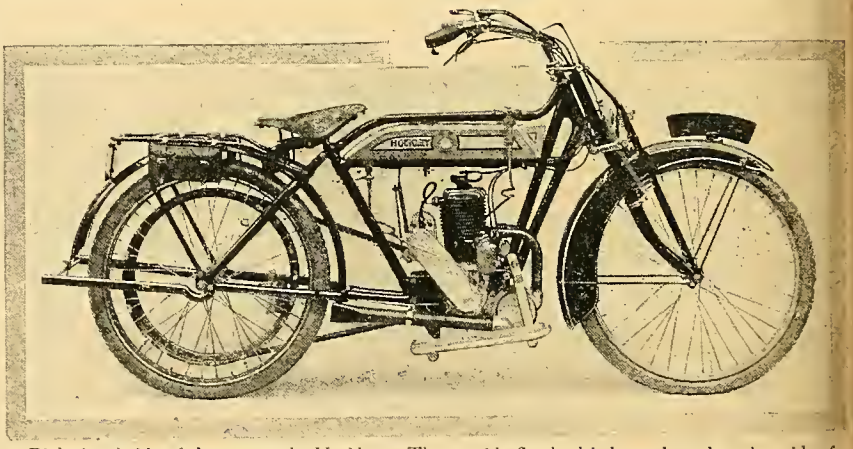
THE HOCKLEY TWO-STROKE.

YET another addition to the ranks of two-stroke manufacturers is the Hockley Motor Manufacturing Co., of Bar Street, Birmingham. The machine which this firm is producing is expressly designed for overseas work, though it is intended to market it in this country as well.

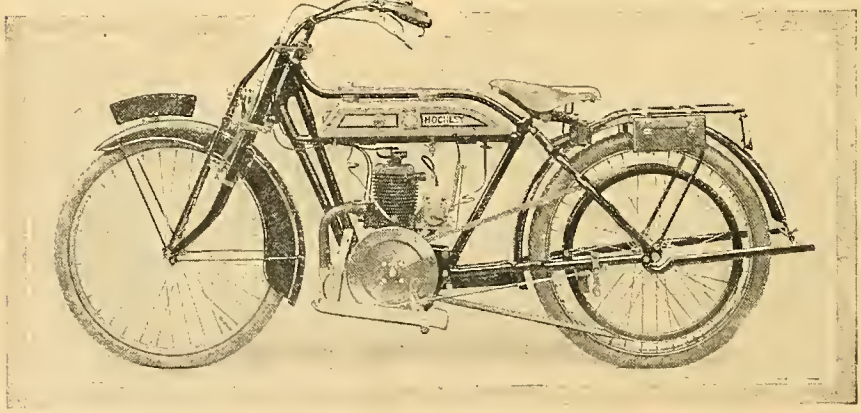
The most striking feature is the frame design, which is claimed to give such a powerful construction that it is unbreakable even when used over the worst Colonial tracks. The chief point in this construction is the arrangement of two down tubes, one from the top and the other from the bottom of the head lug, which meet at the engine carrying lug and thus strengthen the most vital part of the frame. Throughout, the machine is constructed on commonsense lines, and the big ground clearance and large tank capacity are peculiarly adapted for rough travel in countries where garages are few and far between. Saxon forks and a sturdy and sensible equipment with good mudguards help to give the impression of solidity without undue weight, and the engine is a simple and reliable unit with the magneto carried high up behind the cylinder, well out of the way of water splashes, mud, and grit. The magneto is chain-driven from the crankshaft, and the whole platform slides in a line with the drive for chain adjustment.

The Engine.

The bore and stroke are 70×70 mm., and the cooling ribs run down to the base of the cylinder casting, being neatly arranged to give the maximum cooling effect in combination with good looks. All bearings are of special phosphor bronze, and lubrication is by a sight feed drip oiler. The flywheel is outside and of large diameter, and the machine may be obtained either single-geared or with a two-speed counter-shaft gear and chain and belt drive. Twenty-six inch wheels are used, and the brake gear in particular is well carried out. Altogether, the Hockley Motor Mfg. Co. may be proud of a machine which is eminently suited to the purpose for which it was designed.



Right hand side of the two-stroke Hockley. The outside flywheel is located on the other side of the engine. A feature is the double front tube.



Flywheel side of the new two-stroke Hockley, which has been designed mainly for use overseas.

Rings Sticking in Two-strokes.

Sir,—I notice that manufacturers of two-stroke motors, ven appealed to for information on the subject of stuck up ston rings, generally advise, as a remedy, a reduction in e quantity of oil used. As the owner of a two-stroke, I ve followed this advice, but the sticking up of the rings ems to become more frequent as the oil is reduced.

On consideration, I am wondering whether the advice nerally given is not based on a fallacy. I suggest that e cause of the rings sticking up is primarily due to the gine overheating. The less oil used, the more the engine erheats, with the consequence that the liability for the gs to be stuck up becomes increased.

When I take my cylinder off, I find that the rings are nt hard in their grooves. The rings and the piston are lded together, and paraffin is useless.

n the circumstances, I think that the real remedy may in increasing the quantity of oil instead of reducing it.

The above, of course, refers to the petroil system of rication. W. HILL.

The Institute of Inventors.

Sir,—In connection with the establishment in this country industries hitherto carried on in Germany and Austria, e of the most important points is to obtain accurate formation on the technical problems involved. The best ilable source of such knowledge in this country is the cellent library of the Patent Office, where the easy acces-ility of the books is a constant source of pleasure to readers. Soon after the outbreak of the war, the mptroller found it necessary to close the library in the ening, which prevented inventors and manufacturers, who engaged in the daytime, from visiting it. It will, no ubt, interest many of your readers to know that, at the uest of this institute, the Comptroller has now informed that he has made arrangements to keep the library open til 6 p.m. on Saturdays. Those who wish to profit by s concession may obtain permission from the librarian.

May I take the opportunity of informing British inventors, ho evidently form a considerable proportion of your readers, t the letter which you were good enough to publish me time ago inviting suggestions from inventors, with gard to the proposed amendment of the Patent Law, ught in so many useful and important replies that our rliamentary Committee is now in a position to deal with matter when the nation can again turn its attention home affairs. WALTER F. REID,

Chairman, Institute of Inventors.

The Conviction of A. G. Cocks.

Sir,—You will probably be aware that on Saturday, ember 5th, Mr. A. G. Cocks, the well-known Clyno rider, s tried by court martial at Hull for having in his possession Filey "component parts of wireless apparatus contrary to Defence of the Realm Act."

The President of the Court stated: (a) That no charge of mmunication or attempted communication with the enemy s being brought forward; (b) that Mr. Cocks's character s not doubted, and that no evidence as to it need be ught.

The G.P.O. witness read a letter to the court from the stmaster General stating that, as the accused was a British bject, he had no desire to press the case. The same witness a stated that the portable set in question was only capable en connected with the necessary aerial, and in its present ndition, of transmitting for one mile. The necessary aerial and station in general were, of course, dismantled in the ordinary way by the G.P.O. people at an earlier date, when all amateur wireless stations were similarly treated. The station, therefore, was "reasonably incapable of being worked." The President also stated that no importance was attached to the Morse code charts, etc., found on the premises. Mr. Cocks had only committed a small technical offence. Nothing was secret, and he had had correspondence with the G.P.O. regarding his licence for this actual set. The sentence was six months' imprisonment—four months of which was remitted owing to his already having been seven weeks in custody, thus leaving two months to be served.

The severity of Mr. Cocks's sentence is apparent also from the following facts:

A short time ago a German was sentenced to three months detention without hard labour for having a wireless station on the Essex (!) coast. The German referred to was an unregistered alien. His apparatus was connected to the mains, and was capable of sending over 100 miles. I believe also the following facts were established: The station was unlicensed (Mr. Cocks has held a licence for wireless telegraphy for several years) and had been in constant use.

J. B. TUCKER.

Why an Engine Konks.

Sir,—I am sorry again to trouble you on this subject, but I would like to answer one or two remarks made by Mr Gatehouse. This gentleman tells us that he had an engine that would not konk. This is quite possible, and can be accounted for by the ignition not being sufficiently far advanced, or either through inefficient carburation, whereby the full power was not possible. Mr. Gatehouse also mentions that he has had engines with tight pistons that would konk, and he states that they were bad engines for konking. They may have had only a very small clearance when the pistons and cylinders were callipered; but lots of cylinders are not of the same dimensions when hot—some of them take most peculiar shapes, and no doubt Mr. Gatehouse's engines that were given to konking with tight pistons had *very* loose pistons *when they were warmed up.*

Mr. Gatehouse mentions in his last paragraph that cylinder distortion may cause a konk. I should very much like to know what it is the cylinder distorts against to make such a noise, or perhaps this gentleman means that when the cylinder distorts, there is a lot of piston clearance. In that case he agrees with my ideas that it is only piston clearance that causes konking. OSBORNE DE LISSA.

Sir.—If you can spare any more space in your columns for the fruitful topic of "konking," I should like to state my experience, although I am afraid my letter will tend rather to disprove some of your correspondents' suggestions than to offer any new theory. *Re* the "pocket" theory, I had a 3½ h.p. single-cylinder machine with overhead valves opening directly into the combustion chamber, and without pockets of any kind. This was the worst offender in respect of "konking" of any machine I have ever met with—it would konk at any time, hot or cold, on the slightest pretext, although I cleaned it out at least every three hundred miles. It was a fast machine with considerable valve overlap, and ignition rather advanced though not abnormal. Your correspondent Mr. Gatehouse suggests that engines with detachable heads are practically immune from konking. This engine had a detachable phosphor bronze cylinder head. ALFRED W. TUTT.

Flywheels.

Sir,—There seems to be considerable disagreement amongst manufacturers as to whether the flywheel should be inside or outside. For instance, on November 12th you describe a new Levis with an inside flywheel, and, on the other hand, a new Humber with an outside one. In this diversity of practice regard should be had to theoretical considerations. The moment of inertia, *i.e.*, the measure of the equalising power of a flywheel, is given by the formula $I=MR^2$, where M is the mass and R the radius. Therefore, given the weight as constant, the larger the radius, consistent with strength, the greater the moment of inertia. Now it appears to be pretty obvious that, with the limited space available for machinery on a motor bicycle, a larger flywheel for a given strength can be fitted outside than inside the engine. Hitherto, outside flywheels have mostly been confined to two-strokes, but I am confident they would improve the running of four-strokes, especially the big single-cylinder variety. The success of a very popular twin four-stroke is, I believe, largely due to the fact that it has an outside flywheel. H.L.L.

Artistic Appearance.

Sir,—I hope you will allow me to express my regrets through your columns at the modern trend of motor cycle design, whereby appearance and symmetry are sacrificed (sometimes needlessly) to what is not always utility. I refer to the sloping tube.

Artists tell us that a curve is the line of beauty, but if a curve implies a real weakness there must have been many broken frames, especially Indians, whose engine rests in a curved cradle. I may say I have never heard of these frames breaking. Why, then, sacrifice beauty?

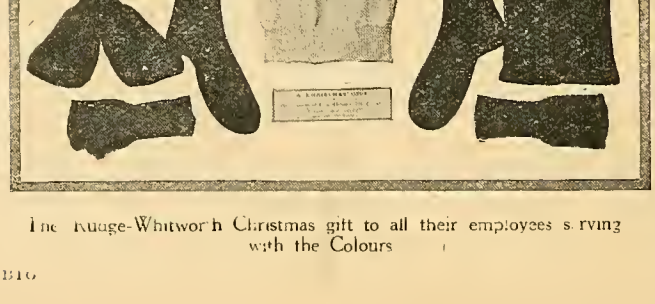
Lastly, though opportunities present themselves, why do not the majority of motor cycle makers adopt the theoretically correct position for the magneto, viz., to the rear of the engine? VULCAN.

Rudge Tommies Remembered.

Sir,—It will be remembered that a few weeks ago the Rudge-Whitworth employees sent to their *confrères* who are serving with the 7th Battalion Royal Warwickshire Regiment a number of warm garments, which were acknowledged by their Company Captain F. S. Hanson, who stated that each member of the company had had at least one garment, many of them two, and that they were keenly appreciated.

A further set of presents is now being sent. This will consist in each case of a knitted helmet, muffler, pair of socks, body belt, and pair of mittens, together with a cigarette case filled with cigarettes.

The girls, both in the offices and works, have been exceedingly busy for some weeks past with the knitting needles, and 150 Tommies will receive this little remembrance, including three who have been unfortunate enough to be interned in Germany. RUDGE-WHITWORTH, LTD.



The Rudge-Whitworth Christmas gift to all their employees serving with the Colours

Small Bushes and Drip Oiling.

Sir,—Under this heading, in your issue of December 10th, "Ixion" writes: "I learn that at least one big firm has definitely instructed its customers to open the drip valve fully, and use the pump as if no drip were fitted."

This is quite true, and can only refer to one firm, whom we will not name. For those "in the know," may we venture a friendly comment, which is that, in the particular engine referred to, no oil ducts are provided by the makers, who, we understand, do not believe in them, though nearly all the latest motor cycle engines are designed with suitable oil ways for the main bearing parts—in our opinion, an obvious advantage; but in spite of the consequent need of freely oiling, we still maintain, and the trade generally would appear to agree, that drip is much better than dumping. BEST AND LLOYD, LTD.,

JOHN H. COCHRANE, Sales Manager.

Plugs in Two-stroke Engines.

Sir,—I was much interested in the Comment headed "Thick and Thin Electrodes" by "Ixion," as this is a subject in which I have had a lot of experience, particularly with two-stroke engines, as plugs give more trouble with this type of engine than with any other.

I quite agree that a multiple-point plug, in which the points are thin, will give trouble in a "dry" engine. This is very noticeable with a two-stroke engine lubricated by the petroil system, and anyone using this type of plug will find that, after a few miles hard running, as soon as a hill has to be climbed, a peculiar trouble will make itself manifest. The machine which has been running splendidly will, when about half-way up the hill, without any warning, pull up as if the engine had seized, but after a few moments' stop will start off and run perfectly again. Now this is all caused by the engine requiring more oil than it is getting, and therefore none is left to get up *viâ* the transfer port to the cylinder head, where a quantity would get on the plug points and help to cool them. The points, therefore, get incandescent, with the result mentioned above.

While experimenting with a well-known two-stroke employing petroil lubrication on Brooklands, I had much trouble with plugs, as I was using rather a high compression, and after trying nearly all the best-known plugs on the market, found that the only one which would stand up to more than two laps "all out" was a well-known single-point plug of, I am sorry to say, German manufacture, but I have since tried and found the Lodge single-point plug quite equal. Now, suspecting the lubrication to be insufficient for racing speeds, I fitted an oil pipe from a hand pump to the crank case, and found that by giving oil in this way, so as to keep the engine smoking well, I could use several multiple-point plugs and still do the same lap speeds without "drying up" the engine. Of course, as was to be expected, on taking off the cylinder the head and plug points were covered with a film of oil, whereas, when only using petroil, the cylinder head was dry. I also tried a plug which gives perfect results on Scott machines, which may rightly be termed to have a "wet" engine, and found it would dry up after one lap with petroil lubrication, owing to it causing the engine to be too "dry," which also helps to prove "Ixion's" argument.

I think the above goes to prove that a single-point plug is the best for a "dry" engine, and this theory is pretty well upheld by the fact that I used the same Lodge single-point plug in my Clyno two-stroke right through the Scottish Six Days Trial, and never had the slightest trouble with it, though I repeatedly asked for trouble from that quarter by driving the engine all out for long distances or some of the worst hills on low gear.

In conclusion, I would like to advise your correspondent Mr. W. Edner, to fit a magneto handle-bar cut-out on his Connaught two-stroke, as I always used one on my machine of this make; he can then cut off the ignition and coast down hills with the throttle open. He will find that by doing this he will cool his engine, and at the same time let a quantity of oil into it. An alternative is to fit a two-way tap under the oil pump, and then put an oil pipe with an adapter screwed into the drain plug hole in the crank case; he can then give a charge of oil when running down hill and also when faced with a stiff hill. This pipe he will find, is a great advantage, and will make his machine a better hill-climber, though naturally he will use a little more oil per year. ARCHIE G. COCKS.

THE NEW TRIUMPHS.

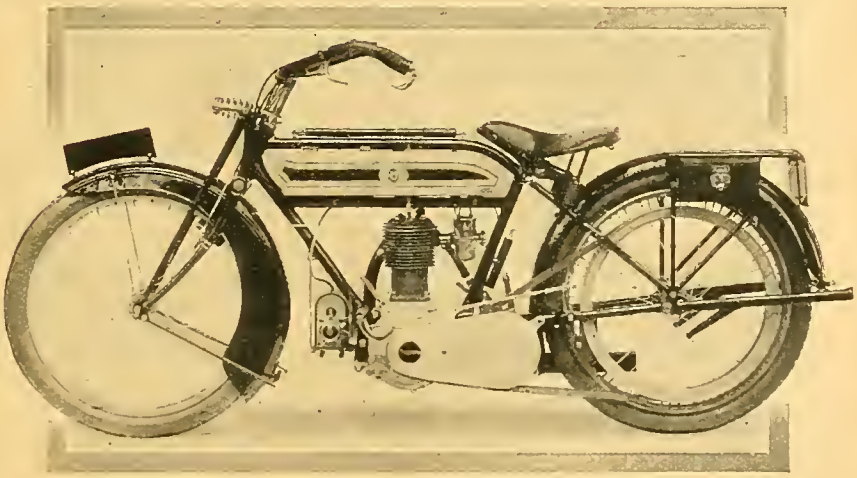
An entirely Re-designed 4 h.p. Model for 1915. Improvements to Two-stroke.

WE have already announced the fact that the 1915 Triumphs would be a considerable departure from usual Triumph practice. Our announcement occasioned a good deal of interest, as is shown by the communications we have received on the subject. It can be said that for ten years the Triumph machine has undergone but detail improvement. Year after year the little weaknesses have been eliminated and improvements embodied, all of which have helped to build up the proud position which the trusty Triumph holds. Last year a 4 h.p. machine and the introduction of a two-stroke lightweight mount were the most notable departures in the Triumph programme; but 1915 marks the appearance of an entirely new design of engine, a three-speed countershaft gear in the bottom bracket, and the increasingly popular chain-cum-belt transmission.

We will deal with the 4 h.p. model first, as more alterations are notable in the design of this machine.

The bore and stroke are 85 × 97 mm. (550 c.c.). The timing gear is of the simplest possible description. There are but two wheels, the main driving wheel and the half-time wheel, with which latter three cams are formed from the solid, viz., the decompressor cam together with the exhaust cam and the inlet cam. The horizontal rockers lap over the cams so that a direct lift is obtained.

The cylinder casting is quite new, having ample air spaces between the cylinder and the valve pockets, which is bound to result in much improved cooling. The valves on the 1915 model are of 1⅝in diameter (compared with 1 7/16in. in 1914), and have flat tops. Next year's timing gear case is circular in shape, and the cover is fixed with a spigot joint and internal lugs, resulting in a smooth exterior, rendering the cleaning process much easier



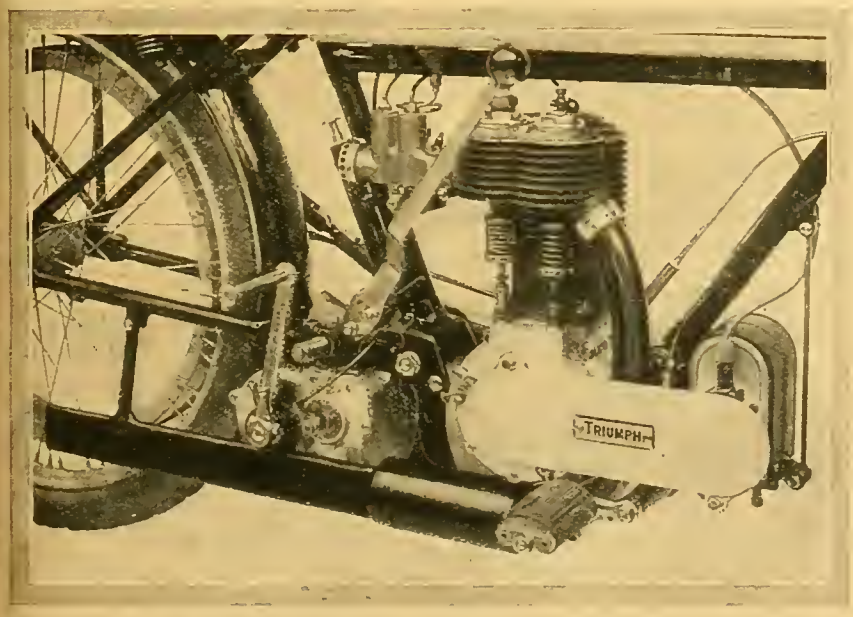
Transmission side of the new 4 h.p. Triumph—a completely new design of machine. Chain-cum-belt drive is employed.

The piston is of the flat top variety and fitted with three rings, two of small depth with diagonal slots at the top, and a deeper step cut ring at the bottom.

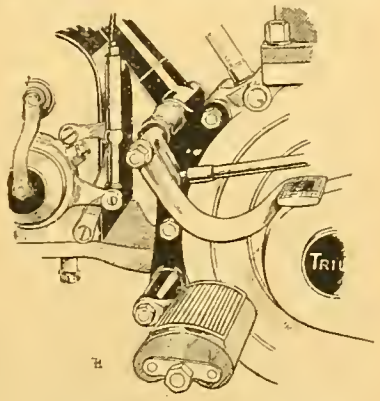
The silencing arrangement, too, has been entirely re-designed. Instead of the bracket which has usually formed the end plates for the silencer and a platform for the magneto, it will be noticed that the silencer is arranged immediately under the timing gear case, and thereafter a flat pipe conveys the gases to the rear.

To adjust the magneto driving chain a feather is formed on the platform and a corresponding keyway in the base of the instrument. Thus, it is impossible to fix in position out of alignment. The magneto, too, is 1⅛in. higher than on the current year's model.

The carburetter is of a new design, having the jet between the air and throttle barrels. It is practically automatic in action. One starts the engine with the air lever wide open, and it is only on very severe hills that it requires closing off.



Power plant and countershaft gear box of the 1915 4 h.p. Triumph, showing car type change speed lever, kick starter, and new silencer and exhaust pipe.

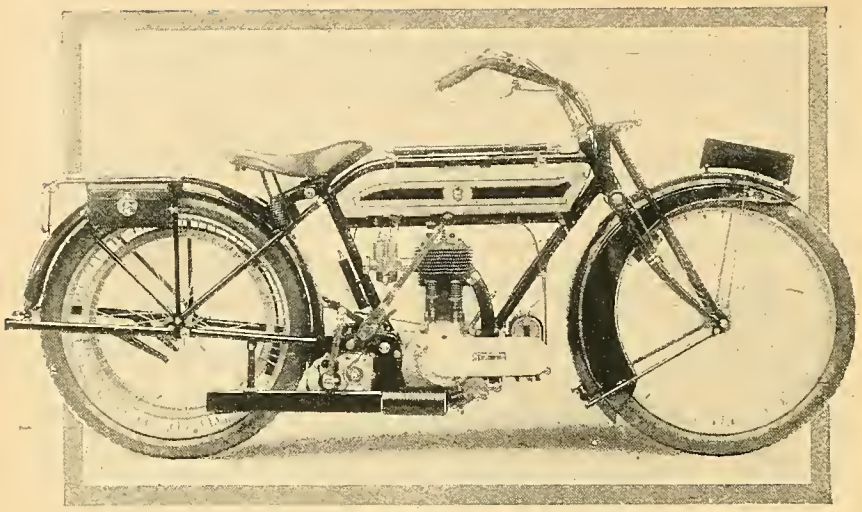


Foot-brake pedal, magneto control, and footrest of 1915 pattern Triumph

Gear and Transmission

The countershaft gear is the Sturmey-Archer three-speed, which is highly spoken of on all hands. It is of the sliding dog clutch type, the changes being effected by a round lever, and we feel sure that the operation of changing up or down will possess not the slightest difficulty even to a person experiencing his first run.

For the first time on record, the standard Triumph has a hand-operated



The 1915 model 4 h.p. Triumph, which has been entirely re-designed.

cork insert clutch controlled by a lever situated immediately in front of the valve lifter. This departure will, we feel sure, be commended by all practical motor cyclists.

A neat kick starter is embodied with the gear, the mechanism of which is entirely enclosed. The adoption of a countershaft gear and a kick starter, of course, leaves the back wheel simple and plain, and therefore readily removable. To simplify the removal process, a new type of brake has been adopted, the fibre block operating inside the groove of the belt pulley. It is just as powerful in this position as ever, which is saying much, as it will be agreed that the braking power of Triumphs has always been well studied.

The frame is similar to that in use in 1914, with a dropped top tube, but, of course, the bottom bracket has necessarily been re-designed to accommodate the countershaft type of gear. The front mudguard, too, it will be noticed, is practically the same as that used in 1913, as it has been found after extensive trial to be the most effective design.

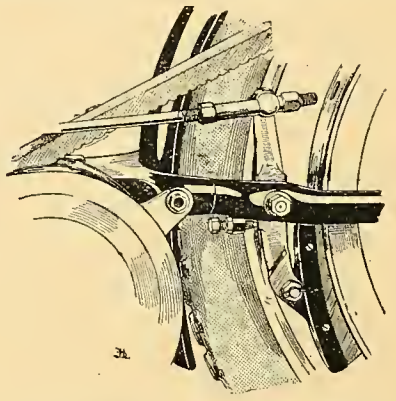
The tank now holds one and a half gallons of petrol, an ordinary enclosed lubricating pump is resorted to, and another refinement we noticed were wings fitted to the rear guard below the carrier.

We enjoyed a short spin on the new Triumph, and found it extremely controllable. It started at the first kick with the decompressor in action, and would throttle down to very low speeds even on full compression. It accelerated in remarkable fashion, and, thanks to the handle-bar controlled clutch and an easy changing gear, we at once felt quite at home on the machine.

The latest Triumph has undergone exhaustive tests for 6,000 to 7,000 miles, and has proved superior to any production of the Triumph Works. In particular it will stand hard driving for prolonged periods without a tendency to "dry up."

The Two-stroke Model.

To turn to the two-stroke, this mount for 1915 has undergone very little change, and it is interesting to observe that the main alteration is in connection with equipment, which formed the subject of criticism in a recent issue of *The Motor Cycle*. 2¼in. tyres have been standardised on this little machine, and a Brooks saddle of large size.



Showing action of rear brake on latest Triumph. It operates inside the groove.

Except for a new type carburetter with top feed and separate chambers for the air and throttle slides, the 1915 two-stroke Triumph is unaltered. The bore and stroke of this mount are 64 × 70 mm. (250 c.c.)

HEROIC DESPATCH RIDER'S DEATH.

At his father's residence, near Colchester, Essex, Corporal Eric Goodheart, who was one of the first motor cyclists to see active service as a despatch rider, has died of typhoid fever. Corporal Goodheart was mentioned in despatches by General Sir John French, and was subsequently awarded the Medal for Distinguished Conduct in the Field. He was home on short furlough.

MOTOR CYCLIST RESERVE COMMITTEE.

We are constantly asked by our readers to whom they should apply to obtain positions as motor cyclist despatch riders, and in consequence we give below a list of the secretaries of Motor Cyclist Reserve Committees in the various divisional areas.

EASTERN COMMAND—

HOME COUNTIES DIVISIONAL AREA.—Rev. F. W. Hassard-Short, Chaplain Kent Cycle Battalion, 2, Castle Street, Canterbury.

EAST ANGLIAN DIVISIONAL AREA.—Major E. Evans, D.S.O., D.A.A., and Q.M.G., 13, Northgate Street, Bury St. Edmunds.

SCOTTISH COMMAND—

HIGHLAND DIVISIONAL AREA.—Mr. J. H. Thomas, 52, Tay Street, Perth.

LOWLAND DIVISIONAL AREA.—Captain J. H. Barrie, R.E. (T.), 21, Jardine Street, Glasgow; and Lieut. J. B. Mayor, 1st Highland Field Company, R.E. (with the Scottish Army Troops Signal Company), 21, Jardine Street, Glasgow.

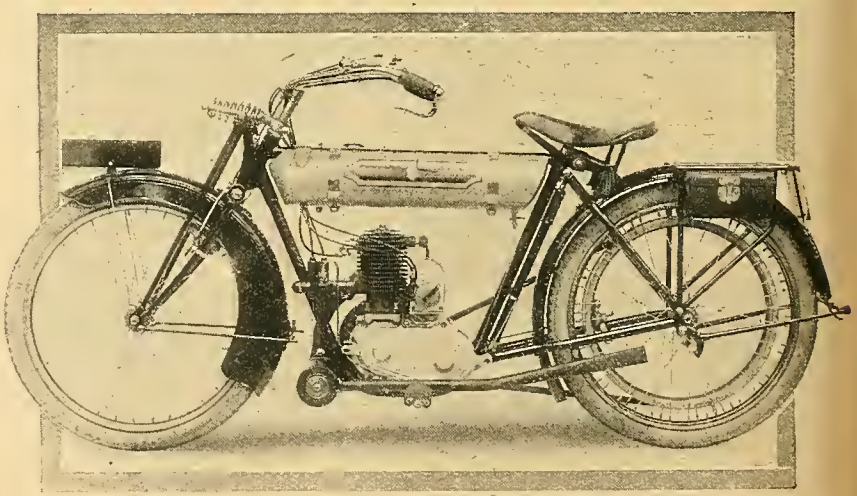
SOUTHERN COMMAND—

SOUTH MIDLAND DIVISIONAL AREA.—Mr. P. Grout, The Avenue, Keynsham, Bristol.

WESSEX DIVISIONAL AREA.—Colonel the Rt. Hon. Lord Montagu of Beaulieu, Beaulieu, Hampshire; and Lieut. W. McD. Allardice, Army Inspectors' Dept., Small Heath, Birmingham.

LONDON DISTRICT COMMAND—

Mr. T. W. Loughborough (Secretary Auto Cycle Union), Royal Automobile Club, 83-89, Pall Mall, London, S.W.



The two-stroke Triumph as it takes the road in 1915. It has 2¼in. tyres

The M.C.C. Bohemian Smoking Concert.

ON Friday last a most successful Bohemian smoking concert, organised by the Motor Cycling Club, was held at the Café Monico in aid of the Belgian Relief Fund. The burden of the organisation, which was particularly well carried out, fell upon the shoulders of Mr. W. H. Wells. The large room available for the concert was packed with people, and late arrivals had difficulty in finding seats.

The programme, from start to finish, was of the very best, and the turns, one and all, were excellent. During the interval Mr. Robert Head, the chairman, stated that he hoped that the proceeds, which would be handed over to the *Daily Telegraph* Belgian Relief Fund, would be between £50 and £60. Speaking of the club, he stated that of a membership of between five and six hundred, one hundred and sixty had joined the Colours. He made special mention of the honour conferred upon Corporal B. J. Hallowes, to whose doings we referred in the last issue of this journal, and to A. J. Sproston, the plucky rider who was mentioned in despatches. The latter had sent a message to the chairman saying that he was with them in spirit that evening, mentioning how the sporting competitions, in which he had been engaged, had contributed to his success while on active service. In conclusion, Mr. Head said that those present owed a big debt of gratitude to those of their members who were fighting for them at the present time. The health of those members of the Motor Cycling Club, who were fighting for their country was then drunk with musical honours. Among those who have been abroad we noticed Corporal F. L. Bassett, R.E., who is shortly to receive a commission in an infantry regiment, and Vernon Taylor, who has been serving with the French Army near Soissons.

On another occasion during the evening, Mr. Head rose and stated that he had been requested by the Belgian Ambassador to allow certain ladies, representing the Society for the Relief of Belgian Refugees, to make a collection that evening. These ladies then made a tour of the hall collecting contributions and selling small medals commemorating the bravery at Liège.

Almost at the conclusion of the concert, Mr. Gelder, of the F.N. Co., suggested that the accompanist should play the Belgian National Anthem. This was then played, with the whole company standing, while later the artiste, who was also an expert with the concertina, played the Marseillaise and the Russian National Anthem.

COVENTRY & WARWICKSHIRE M.C.

The roll of honour of the Coventry and Warwickshire M.C. contains many names well known to motor cyclists. This list is as follows:

MEMBERS.

G. E. Cyffe (Despatch rider)
G. I. Francis (Despatch rider)
T. E. Newsome (Motor Transport)
A. Hill (Red Cross)
E. Rotherham (Capt. 7th Royal Warwickshire Regiment)
S. A. Rowlandson (Motor Transport)
A. P. Smith (Major 7th Royal Warwickshire Regiment)
H. Trepass (Despatch rider)
C. T. Newsome (Despatch rider)
W. A. Davenport (Motor Machine Gun Battery)
J. H. Pountney (Motor Machine Gun Battery)
R. B. Ewens (Motor Transport)
J. M. Hillyard
A. Walsgrove
J. C. Humphries (Lieut. 7th Batt. Royal Worcestershire Regiment)
J. Gibson
P. W. Johnson
W. Maughan
W. F. Newsome (Motor Transport)
B. W. Shilson
W. G. Tuck
W. D. Wartnaby

OLD MEMBERS.

Capt. Mortimore
C. S. Burney (Despatch rider)
V. Taylor (Motor Ambulance)
R. W. Walker

EDWARDS CUP TRIAL.

The fourth round of the Edwards Cup reliability trials was run off on Thursday, December 3rd. All competitors made non-stop runs, and the winners were as follow: 1, F. Tustin (Triumph sc.), time error 1m. 56s.; 2, F. Thorn (Clyno sc.), 2m. 1s.; 3, H. J. Woodgate (2¾ Douglas), 3m. 15s. The best performance in the four trials was made, for the second time, by H. Petty, who will hold the cup for one year. W. H. Chapman (A.J.S.) made the second best performance in the four trials. Both have done four non-stop runs.

BRISTOL OPEN TWENTY-FOUR HOURS TRIAL.

The Bristol Motor Cycle Club has applied for a permit to hold an open twenty-four-hour trial on Friday and Saturday, January 1st and 2nd, 1915, for solo machines, sidecars, and cycle cars. The course will be Bristol, Exeter, Okehampton, Launceston, Bodmin, Penzance, Land's End, and home *viâ* Tavistock, Two Bridges, Exeter, Taunton, etc.; distance, about four hundred miles. The trial will be run whatever climatic conditions prevail.

Awards will be gold, silver, and bronze medals, with additional prizes of silver cups for the three classes of entrants, for the best performance in each class, provided a bronze medal *at least* is won.

Entry forms can be obtained from the hon. secretary of the trial, Mr. F. C. Wasley, 9, Victoria Street, Bristol. The latest date for receiving entries is Saturday, December 26th.

A group of motor cyclist despatch riders known as No. 1 Section, at present stationed at Aldershot, who will shortly leave for the front. The machines are Rudges, Triumphs, and Zeniths.

Latest London Lighting Regulations.

The Secretary of State's Order for the Metropolitan police district and the City of London, which would have expired at the end of this month, has been superseded by a fresh order. The only new provision that affects road users is that requiring all vehicles to show a red lamp to the rear.

Reflex Lights not Sufficient.

Motor bicycles, push cycles, and band carts—in fact, road vehicles of all types—will have to carry a red tail lamp, and it is important to note that the red glass reflectors will not be considered sufficient.

To Avoid End-on Collisions.

This new lighting regulation has been brought about by the numerous end-on collisions which have occurred since the London streets have been in darkness at night. Although it only applies to London, motor cyclists in the provinces, who are in the habit of motoring to town, should at once see that their lighting outfits comply with the new regulations, which, presumably, will come into force on January 1st.

No Vacancies at Present.

The officer commanding the Second London Divisional Engineers, Duke of York's Headquarters, Chelsea, informs us that all vacancies for motor cyclists are now filled up. Those applicants who have not been successful in obtaining employment should understand that their names and addresses have been noted, and that they will be communicated with in the event of any vacancies occurring.

Drivers for the Motor Machine Gun Battery.

The short paragraph in last week's issue asking for recruits for the 5th Motor Machine Gun Battery brought in such a large batch of replies that it was quite impossible to enlist all the applicants in the positions which were vacant at the moment. All the letters have, however, been sent to the Commanding Officer of the Battery, and, as openings occur, the writers will be communicated with in due course.

We have been informed that more batteries will be raised, and more experienced motor cyclists will be required later on, preferably men having had some military experience. At the moment motor cyclists particularly wanted are those who know the Scott motor cycle thoroughly, and who, in addition, have done some soldiering. A few mechanics are also desired who are conversant with the Scott machine, and who are prepared to accompany the sidecar machine gun batteries to the Front.

Applications should be addressed to Mr. Geoffrey Smith, *The Motor Cycle*, 19, Hertford Street, Coventry.

Prize Winners Wanted.

Will Messrs. Moore and Williams, of Cardiff, who took part in the Weston-super-Mare speed trials last June, communicate with Mr. Philip Grout, Keynsham, near Bristol? Mr. Grout is the late hon. sec. of the Bristol Motor Cycle Club, and he is now sending out prizes won during club competitions.

Motor Cyclists Required in Yorkshire.

The Auto Cycle Union informs us that a number of motor cyclists are required for carrying out special work in the East Riding of Yorkshire. Motor cyclists resident in this district should communicate in writing with Mr. J. R. Proctor, Clerk to the Lieutenancy, Lieutenancy Office, East Riding, Beverley.

Across London on Armoured Sidecars.

Last week a party of motor cyclists, now in training at Bisley, were sent to Woolwich to fetch to the camp eighteen Scott sidecars with quick-firing guns, such as we have illustrated.

The procession of so many armoured sidecars through the suburbs of London naturally caused a sensation. The journey was successfully accomplished, though several of the motor cyclists had never handled a Scott before. One managed to bowl a dustman over.

How the War Funds Stand

The principal war funds amounted to the following figures on Tuesday last:

	£	s.	d.
H.R.H. Prince of Wales's National Relief Fund ...	4,122,000	0	0
H.R.H. Princess Mary's Fund to provide Christmas Gifts for Soldiers and Sailors	139,189	0	0
The Queen's Work for Women Fund	97,063	0	0
The Times Fund for Sick and Wounded	760,812	15	1
The Daily Telegraph Belgian Relief Fund ...	88,130	5	7
Indian Soldiers' Fund ...	102,731	0	0

A MILITARY MOTOR CYCLE WEDDING.

On Sunday last an interesting wedding took place at the Old Parish Church, Greenwich, the bride and a lady friend riding to the church on motor cycles. The bride was preceded by the bridegroom—who is in the 1st Company Sportsmen's Battalion—on a sidecar machine, and our picture shows the pair leaving the church.

Tales from the Front.

"The Tales that Motor Cyclists Tell," runs the headline to certain despatch riders' experiences. Yes, indeed!

British Motor Cyclists in Russia.

News has been received by *The Motor Cycle* from the British motor cyclists who accompanied the big batch of motor cycles supplied for the use of the Russian Army. Of 150 machines uncrated at the time the letter was despatched, not one gave trouble in starting up, despite the cold weather. There are fourteen riders in all.

Wireless Apparatus Illegal.

A. G. Cocks, a well-known competition rider, was tried by court martial on the 5th inst. on the charge of having in his possession at Filey a wireless apparatus in contravention of the Defence of the Realm Act. Cocks explained that he was a British subject, and had a wireless licence in Birmingham, and had applied to have it transferred to Filey. The purpose of the installation was to demonstrate and lecture to boy scouts.

Counsel for the defence submitted that the offence was a technical one. Cocks was, however, sentenced to two months' imprisonment.

Winter Trial in the West.

Manufacturers and those sporting motor cyclists who enjoy winter riding are not, after all, to be robbed of an important annual winter run, the Bristol Motor Cycle Club having decided to fill the breach by arranging a run to Land's End and back on January 1st and 2nd. This enterprising body is endeavouring to carry out the motto of "Business as usual," but it has, at the same time, by no means overlooked the patriotic side of the question, for not only has it contributed £10 10s. to the Princess Mary Fund, £10 5s. to the Prince of Wales's National Relief Fund, and £30 to *The Weekly Despatch* Tobacco Fund, but prominent officials of the club are, and have been, engaged in recruiting despatch riders since the beginning of the war, and have, moreover, arranged trips for wounded soldiers.

The Bristol M.C.C. is looking forward to a representative entry for the New Year winter run, and, in view of the fact that practically every manufacturer has produced a 1915 model, and that prospective buyers are waiting to note their performances on the road, the Bristol trial offers an excellent opportunity.

S. W. Carty, a prominent Mersey motor cyclist, was presented by a number of Liverpool and district motor cyclists with a sword, revolver, and glasses, upon obtaining a commission in the A.S.C. The photograph was taken at a smoking concert specially arranged for the occasion on Thursday of last week.

Early Road Races.

Just ten years ago there was run off a race in France at St. Arnouet, some forty miles from Paris, in which a mere handful of competitors took part, but which was destined to be the origin of properly organised international road racing, and a direct forerunner of the Tourist Trophy Race. This was the International Cup race, which was competed for by five nations—England, Germany, France, Denmark, and Austria—eleven riders in all. Rignold, Hodgkinson, and Silver formed the British team, and any chance they had of winning was destroyed by frightful tyre troubles. In fact, the race roused a regular hub-bub owing to the alleged malicious strewing of nails on the course to the detriment of the riders. As certain of the home riders escaped scot-free, rather pointed remarks were made that they were cognisant of the presence of the nails. The race was won by France, the actual winner being Demester, who rode a Griffon, then one of the most famous machines on the market. The next year an Austrian won, and after that Continental racing fell rather flat, and the Marquis de St. Mars set the ball rolling again with the Tourist Trophy. From that day onward British motor cycles have been supreme both at home and on the Continent except for one American victory. Viewing the sweeping successes of English machines of late years on the Continent, it is curious to look back a decade and see with what reverence we regarded our present day Allies as motor cycle designers and makers. But whereas French makers developed their machines along the lines of speed, our manufacturers rather sought reliability, and time has proved the soundness of their methods and the success attending them.

Sidecars are being put to a variety of uses in the war. Many, for example, are being used by our French allies for transport purposes, and this illustration shows a group of such machines. The sidecars are a few of a large order completed by the Gloria Company for the French War office, the photograph being taken at the Grand Parc d'Artillerie de Reserve, Montluçon (Allier). The bicycles to which they are attached are Triumphs.

MILITARY NOTES.

The Design of Military Cycles.

Maurice Greenwood, who is at present driving a Daimler lorry with the Expeditionary Force, writes endorsing Vernon Busby's views on the ideal machine for military work; the latter's experiences and views were published in *The Motor Cycle* of September 24th. Greenwood maintains that what is required are bigger tyres, stronger frames, wheels and spokes, larger carriers, and counter-shaft change speed gears. With his company there are eight motor cycles—seven Triumphs and a B.S.A.

Fur Clothing for Despatch Riders.

Now that nearly everybody at home is sending warm clothing to friends at the Front, it is interesting to note that Messrs. Peter Spicer and Sons, of Leamington, have acquired 500,000 Australasian coney skins for making into waistcoats, coat linings, fur-lined overalls, moccasins, sleeping bags, etc. Prices range from 12s. 6d. to 30s. The makers' efforts are to produce really warm, serviceable, and moderately-priced winter outfits. It would be difficult to imagine a more suitable Christmas present for a despatch rider than one of the many kinds of fur-skinned clothing sold by Messrs. Spicer and Sons.

Fur-lined waistcoat made by Peter Spicer and Sons of Leamington, from Australasian coney skin. A more suitable gift for a despatch rider could scarcely be imagined.

F. C. North Going Strong.

We have seen a letter written by F. C. North, the Ariel rider, to Mr. J. S. Hubbard, of Components, Ltd. North is a despatch rider with the British Expeditionary Force, and, judging by his letter, he is having a very exciting and strenuous time. He is evidently in the best of spirits, and says that his machine is going splendidly and not giving any trouble.

Well-known Riders in Russia.

We have had a letter from J. Oliphant, who, together with several other riders, is at Petrograd looking after the English-built motor cycles which have been supplied to the Russian Government. At the time of his letter only 150 machines had been unpacked, but not one had given the slightest trouble, all starting quite easily. While waiting for the arrival of their machines the Russian authorities asked them to assist in preparing some Crossley ambulances for the road, which were urgently needed at the Front. All worked on the cars with a will, not stopping for rest on Sundays. The party consists of fourteen, including Graham Dixon, L. Cushman, V. Harrison, and others, as shown in the photograph which we reproduce, and which Mr. Oliphant kindly enclosed in his letter. They expect to be in Petrograd for another two months from the time of writing, by which time their work in the Russian capital should be complete.

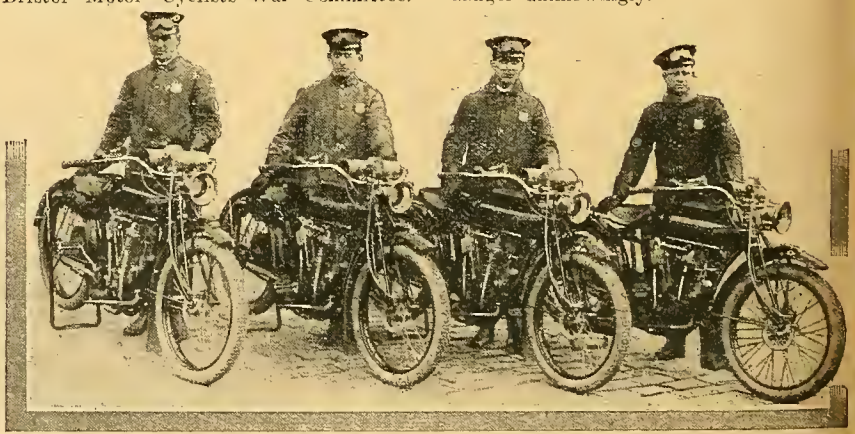
British motor cyclists who are looking after the Russian army motor cycles. Top row left to right: L. Cushman (Premier) and C. Guise (Enfield). Bottom row: R. Brook (Humber), J. Oliphant (Premier), and Eldridge (B.S.A.)

Army Airmen.

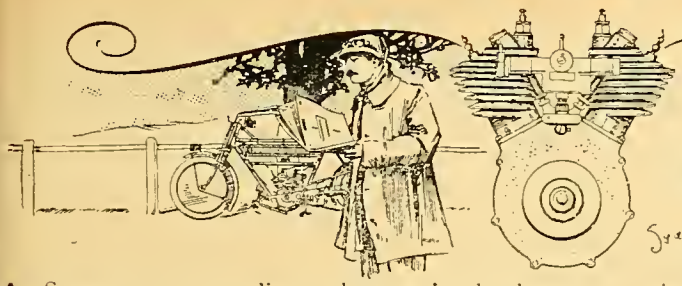
Corporal T. M. Davies was one of the despatch riders who enlisted through the Bristol Motor Cyclists War Committee. He is now serving in the 1st Signal Section of the 1st Cavalry Division, and has written a long letter, dated October 28th, to the committee, from which we give a couple of extracts:

"We have now been pushing forward for about twenty days, fighting hard practically all the time. Our men have many victories, and so far casualties have been small. Our artillery are simply great, having done much damage to the enemy during the last few days. The airmen assist them by giving position, etc., by different signs, which I cannot explain here. It is a sight to see them; one we call 'Dreadnought' is a marvel—simply hovers over the enemy's guns. Two days ago I saw eight shells (which were fired direct at him) burst all round him, luckily without a hit. Yesterday he, together with another airman, brought down a German machine to earth with a crash. I have not heard if the pilot was killed, though it seemed certain death.

"Despatch riding is somewhat exciting at times; the roads are awful, and sometimes lined with troops for miles—it is all thrills. One night I had to pass four times between several batteries of artillery in action, when we saw lots of scenes, some indescribable. One cannot imagine what actual war is like. Old soldiers say South Africa was a picnic to this. However, we have lots to be thankful for, and we are sure to win in the end, and all will be glad when it is finished. We have had many strange billets—schools, convents, farmhouses, mills, and balcony in theatre. One night I slept in a cart with artillery in action less than two hundred yards away, yet I slept well; in fact, we can sleep under any circumstances almost. Night duty is more difficult than day duty. One never knows exactly the movements of troops, and it is quite easy to run into danger unknowingly."



A motor cycle police squad forming part of the well equipped force of Springfield, Mass. The machines are twin Indians furnished with speedometers and dissolved acetylene cylinders.



THE PURCHASE OF A SECOND-HAND MACHINE

Hints to Beginners.

As many motor cyclists, who are in the happy position of having a sufficiency of cash, buy a new machine every year, it always happens that there are many excellent bargains to be picked up in the autumn and spring, especially the former, for these consist largely of machines which have only been used during the summer months, well taken care of, and possibly have only a very moderate mileage to their credit. These machines are consequently to all intents and purposes as good as new, probably much better than a new second-class article, but, because they are slightly out of date and some men will only have the latest models of everything, they are often to be purchased complete with accessories at a very fair reduction off the list price, especially in the case of models which have been much altered by the makers for the ensuing year.

A beginner usually wishes to start his motor cycling with a second-hand, purchasing a new machine when he has become more or less proficient. This is quite a sound plan, for an inexperienced rider is much less likely to damage a machine that has been run in than a new one, which requires somewhat delicate handling for the first few hundred miles. But in the purchase of this second-hand machine he may be misled and disappointed, unless he has an expert friend to guide him or has been advised as to what points to look to when examining the proposed purchase. It is to help the inexperienced rider or prospective rider that these notes are penned.

What to Examine.

Of course, the safest method is to have the motor cycle in question taken to pieces, examined, and reported upon by an expert engineer at a fee (there are several men who undertake this work); but we will suppose that such an examination is out of the question for some reason or other and proceed to give the novice a few easily followed hints for his guidance—the expert will find nothing new in what follows.

In the first place, it is not advisable to place too much reliance on general appearance, though this, if good, certainly points to careful usage; but unless one happens to know that the owner is an expert it does not guarantee the internal and more important condition. Some riders take very little trouble in keeping the exterior smart, while they are careful to keep the working parts in excellent trim.

The cycle parts should be examined for marks of ill-usage or accident. The bearings of the wheels and head should be tested for adjustment and freedom. There should be no perceptible rock at these points, but, at the same time, the bearings should be perfectly free, the weight of the valve being sufficient to turn the wheel (of course, with belt or chain removed). In the case of a chain-driven machine the amount of chain adjustment taken up will give some indication of the stretch of the chain. The chain connections should be examined. If a belt is fitted, take note of the condition of the sides, note whether the rubber is cracked or not, and, most important, look to the part where the fastener is attached and feel the inside of the pulley to ascertain if it has worn to a shoulder—the sides should be flat.

A test on the road should be insisted upon. The machine should be run both fast and slow and up the steepest hill available. At the same time ease of starting or otherwise should be noted, making some allowance for a frosty morning, if necessary, for any machine will start more easily in warm weather, as the fuel is more quickly vaporised.

The Engine.

The most important part, namely, the engine, has been left till last. The purchaser should not be persuaded to be satisfied to make a test of the compression or bearings while the engine is cold. A test when the engine is warm may reveal quite a different state of affairs, for the congealed oil will often make a bearing seem quite tight which is distinctly loose under running conditions, and a stiffness in the piston may easily be mistaken for good compression. The crank bearings should be tested by attempting to move the pulley up and down; it should be quite rigid in this direction, though a little lateral play is usual. The big and small end bearings can be tested to some extent by turning the wheel backwards and forwards and noting any play.

Another important point to examine is the lift of the valves, as, provided the tappets are correctly adjusted, which also should be noticed, an insufficient lift is caused by worn cams, and new cams are the only remedy. This is a serious matter, but tappets are easily adjusted or replaced. If the compression is really good—this can be tested by pushing the machine along on top gear, when the back wheel should glide rather than revolve—it may be taken for granted that the piston rings and valves are in good condition, but poor compression may only mean leakage at the valve caps, compression tap, or plug—these points can be tested by being smeared with oil, when bubbles will at once show a leak—and new washers will probably effect a cure.

If the machine was new during the current year, it is unlikely that the magneto will be in poor condition, but it is as well to examine the platinum points for wear.

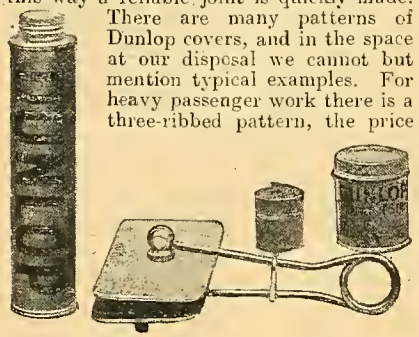
The condition of the tyres—and the tubes—will, of course, be noted. Grip the mudguards and other parts with the hand and test for solidity. Run the fingers along the underside of the petrol tank for moisture to detect any leakage, and do not forget that a smearing of soap will stop a leak for some time.

SOME INTERESTING ACCESSORIES.

Addenda to the Equipment Number published Last Week.

Dunlop Tyres and Accessories.

Glancing through the long list of Dunlop accessories—apart from tyres—one is taken with the Dunlop patch fixer, which is of great assistance when repairing tubes. The patched tube is gripped between the plates, pressure is applied by forcing the ring up the arms, and all air is expelled from under the patch. In this way a reliable joint is quickly made.



There are many patterns of Dunlop covers, and in the space at our disposal we cannot but mention typical examples. For heavy passenger work there is a three-ribbed pattern, the price of the cover in 650 mm. × 65 mm. size being £1 12s. 6d. Then there is the light rubber-studded moulded pattern, a 26in. × 1¾in. size costing 19s. That Dunlop tyres give good service is shown by the service given by tyres of this make fitted to a despatch rider's machine with the Expeditionary Force. The rider in question covered over 2,000 miles with only one puncture over roads and tracks the state of which defied description.

Reliable Tube Repairs.

Motor cyclists who have trouble when effecting repairs to inner tubes through the patches not remaining in place, or a puncture appearing elsewhere, etc., should invest in some of the various special kind of patches which greatly minimise, if they do not entirely do away with, such troubles. The best known are the "Patchquick," made by Woodgates Bros., of Tiverton, and the "Holdtite," made by R. Surridge, of 58, Lomond Grove, Camberwell, S.E.

J. Barbour and Sons' Clothing.

It would be difficult to find a more attractive and comprehensive range of clothing for outdoor wear—and in particular for wear in bad weather—than that sold by J Barbour and Sons, of South Shields. Everybody is catered for, and the motor cyclist will find plenty to interest him in the latest Beacon catalogue of oilskins and sou'-westers

The Searle Tube.

The Searle Unburstable inner tube is constructed with a canvas insertion embedded in the rubber of the tube. To allow a certain amount of elasticity so that the cover may be entirely filled, an internal projection runs round inside the tread, and the canvas follows the inner contour. This enables the tube to conform to some extent to the dimensions of the cover, but, at the same time, the canvas prevents the tube from coming out through a cut in the cover and from bursting, even if inflated without a cover. These tubes are, therefore, most excellent for use with old covers, which would be quite unsafe with an ordinary tube. In case of a puncture, which is unlikely owing to the great thickness of the tread, a special repair outfit is sold by the Searle Unburstable Tube Co., 6, Livery Street, Birmingham.

A Waterproof Suit.

There are not many garments other than oilskins, which can be guaranteed to keep the rider absolutely dry in the very worst weather, but the other day we had the opportunity of seeing what is known as a black, shiny-proof combination suit. As its name implies, the coat and trousers are in one, and it is very similar in shape to the ordinary boiler suit. The front is provided with a storm flap, and the collar is lined with wool. The sou'-wester is so designed that it can be buttoned on to the back of the collar.

Express Rubber Company, 1, Worship Street, E.C.

Self-vulcanising Patches.

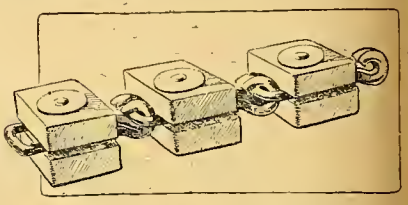
We have received some samples of the Harris security self-vulcanising patches for repairing inner tubes. Of these patches one surface is of rubber and the other of a special preparation which is a bright scarlet in colour. To use the patch the tube is cleaned with petrol, the red cloth on the front of the patch is removed, and the exposed surface is also moistened with motor spirit. The patch is immediately placed over the puncture and firmly pressed down. The tube is at once ready to be replaced in the cover. It is claimed that heat generated on the tyre by running vulcanises the patch to the tube and makes a permanent repair. The makers are Messrs. Harris and Sons, 10-12, Great Chapel Street, Oxford Street, W.

The Stewart Magnetic Speedometer.

Some confusion may have been caused by an illustration appearing in the Equipment Number of an old type Stewart speedometer, whereas the letterpress (on page 653) dealt with a more modern pattern. There is no needle to indicate the speed, the figures appearing on the magnetic cup, which is rotated by means of the eddy currents set up on the permanent magnet driven by the flexible shaft. The makers claim several advantages over speedometers of the centrifugal type, such as more accurate reading at low speeds, and, what will appeal to most people, its low price. The makers are the Cooper Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, W.C.

Bradford Chain Belts.

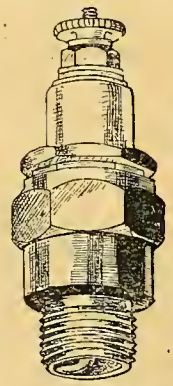
The accompanying illustration of the chain belt made by J. T. Bradford and Co., of 91, Burnley Road, Colne, is practically self-explanatory. The chain is made from the finest steel wire and hardened for wear. A few links at the end are left open in order to obtain the correct length.



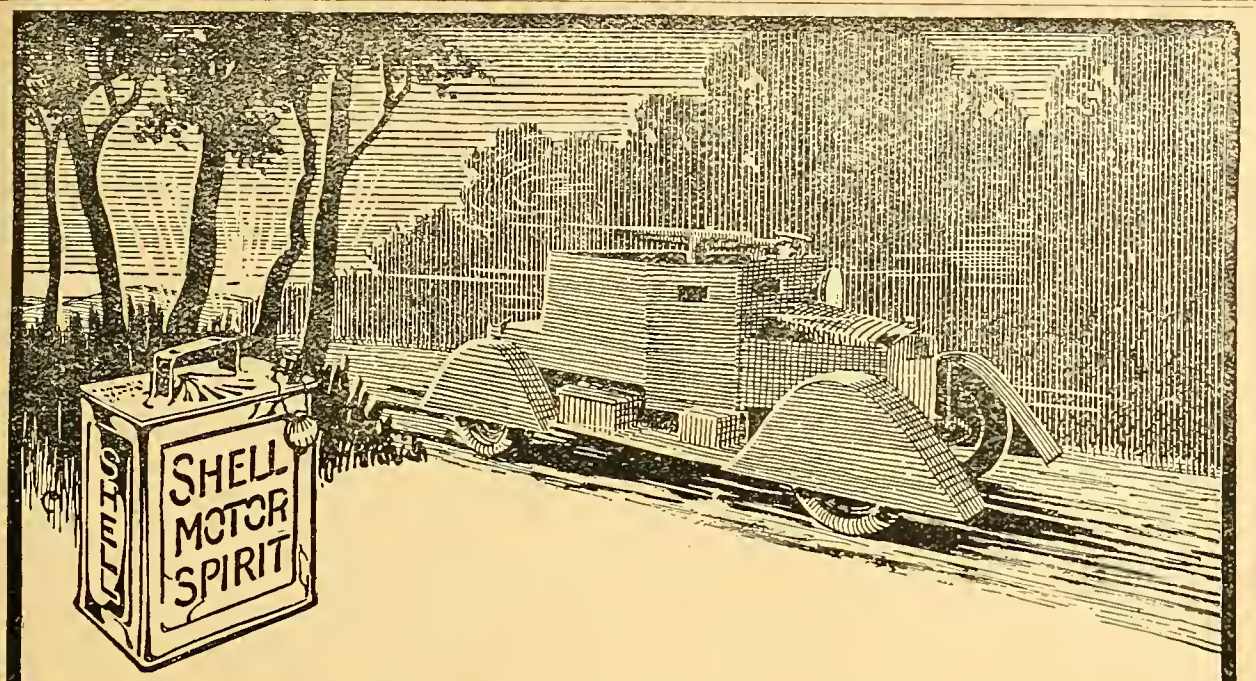
The Bradford belt has been thoroughly tested in bad weather in the Lake District and North Wales, and the results obtained have been most satisfactory. The makers claim that with the Bradford chain belt the engine will give more power at the road wheels than if fitted with a belt of the usual kind, and that consequently less gear changing is necessary.

Sphinx Sparking Plugs and Accessories.

Every type of petrol engine has a Sphinx sparking plug to suit it. The range of types is so wide that it is impossible to refer to each one, and it is hardly necessary, as anyone interested can obtain from the manufacturers, the Sphinx Mfg. Co., Bradford Street, Birmingham, a very attractive catalogue which contains illustrations and particulars of all types. The Sphinx Co. have received further large orders from both the War Office and the Admiralty, and they ask the indulgence of their customers for delays in delivery which may occur during the next few weeks.



The extension pipes made by Willmott Bros., of Norwich, illustrated on page 642 of the Equipment Number, are known as the "Willbro," and not as the Willers.



ARMOURED CARS of the Allies are run on

'Shell' Motor Spirit because it can be thoroughly depended upon under all conditions and because it is so pure and uniform in quality. It is used in all branches of the service for air, land and sea.

'SHELL'
MOTOR SPIRIT

is supplied to the Allied forces only and not to the foes of our country. Fill up on 'Shell' and refuse any other spirit.

OBTAINABLE EVERYWHERE.

1915 and — the QUADRANT

Bearing in mind our oft-repeated claim—"There's no query about Quadrants"—we have, in the planning of our 1915 programme, cut out every element of doubt—

In short, there shall be "no query about Quadrants"—of that we are determined—let us convince you it is so.

In our extended range of 1915 models you will find—

The Quadrant 4¼ h.p. with B.S.A. Countershaft 3-speed Gear, Senspray Carburetter, Dunlop Tyres, Quadrant Engine, Quadrant Spring Forks, Pan-seat Saddle, and Aluminium Foot-boards—

An exceptionally handsome mount supplied with either Chain-cum-belt or wholly chain transmission at the prices following—

Chain-cum-belt Solo £55
Combination £66 11 0.
Chain transmission
Solo £57. Combination £63 11 0.

Let us send you details of the rest.

ILIFFE & SONS LTD.,

Transfer Specialists, COVENTRY. LONDON: 20, TUDOR STREET, E.C.

BAKER & CO., 53, Moseley Building, Johannesburg, are able to show designs and quote South African and Rhodesian customers.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Of Interest to the Allies.

? Will you tell me whether I should have any difficulty in obtaining an English driving licence? I am a Belgian, and my machine was burnt at Louvain, but I am thinking of purchasing a new one.—BELGE.

We see no reason why you should not hold an English driving licence, as you are now domiciled in England. Also, as you are neither German, Austrian, nor Turkish you are free to ride a motor bicycle as much as you like.

A Question of Sidecar Load.

? I am writing to ask you if you could give me advice as to what is a reasonable weight for a 1914 model Triumph and sidecar to carry. My sidecar is rather heavy, and one person says my machine will take it anywhere with a passenger, and another says I shall ruin the machine. I have only had it a short time, and as I am a novice, your advice would be appreciated.—A.N.

The question is solely one of gearing. If the low speed is low enough, the engine will take you practically anywhere, but it is not good to overload the machine more than you can help. A load of 22 stone would be about right.

A Tendency to Four-stroke.

? I have a 2½ h.p. two-stroke Villiers-engined motor cycle, which up to recently has run extremely well, but has now developed a tendency to four-stroke or knock when running down a slight incline, or even at high speed on the level. I have taken down the carburetter and cleaned it, but this has not made any improvement. I may say, although I have not taken down the cylinder since I got the machine (three and a half months ago), I do not think this fault is caused by carbon deposit, as on hills or against a load it pulls and fires very well. Can you give me any help in the diagnosis of the trouble?—W.J.S.

We would suggest that your trouble is caused by (1) too much oil; (2) rather high petrol level; or (3) a faulty plug. The trouble you mention is not uncommon on two-strokes, but there is no particular reason why it should have got worse, as in your case, unless one of the above causes is responsible. It is, of course, possible that you have a leak in the crank case compression chamber, which may cause the same trouble.

Legal and Technical.

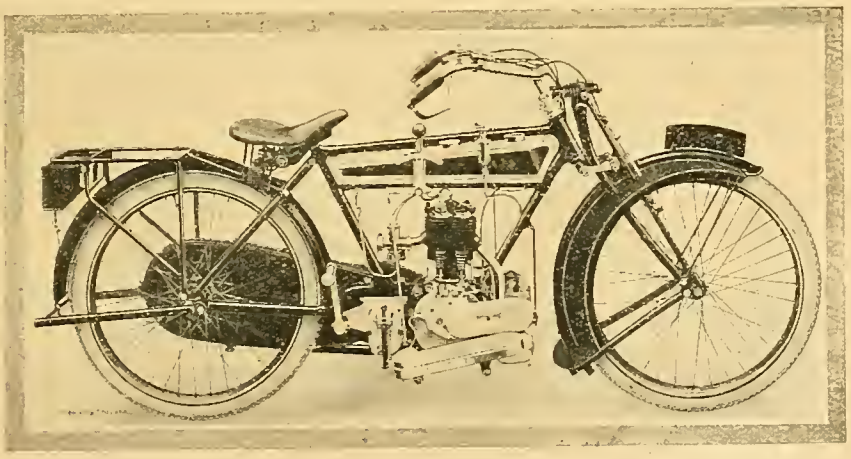
? Is a long exhaust pipe to rear of machine without expansion chamber against the law? Would it be safe to attach a sidecar to a machine fitted with Al'All spring fork attachments? Is the local taxation licence payable on a machine whether it is being used or not? I shall not be using mine again before April, 1915. Have I to pay tax before that time? Will it damage an engine to run it with the cylinder only bolted down at three corners, the fourth bolt having been broken?—J.F.

A long exit pipe without an expansion chamber might cause difficulties. Of course, there is a possibility of your being able to argue that a long exit pipe has the same effect as an expansion chamber, but you would always run the risk of being stopped if the machine makes excessive noise. While it would be possible to attach a sidecar to a machine fitted with the forks in question, we do not think this would be advisable. If you have used the machine referred to in 1914 you are liable to pay till the end of the year, otherwise it will be sufficient to take out the licence when you commence using the machine. We do not think it is advisable to run the engine unless the cylinder is properly bolted down. It is quite possible that the corner of one of the flanges might break away. The defect should, therefore, be seen to as soon as possible. It can be repaired by oxy-acetylene welding.

Difficulty in Starting.

? I have recently fitted to my 1911 Bradbury an Amac carburetter, and find very great difficulty in starting the engine—in fact, I nearly always have to inject petrol before it will fire. The timing is correct, there are no air leaks, and the magneto is perfect. The inlet valve guide is slightly worn, but if I replace my old carburetter the engine fires practically immediately, though with this carburetter the slides are a very shaky fit and the whole thing is leaky. I shut off all air in starting, but cannot start without a petrol injection. When running, I can make the engine just tick over evenly and turn round in the roadway without a miss. In fact, the Amac is all that is desirable except starting.—R.R.

The symptoms point to an air leak in the induction pipe, but the excellent slow running seems to contradict this. The whole affair seems a mystery. Perhaps you have not yet found the best position to place the throttle lever for starting. It is also possible that your carburetter may be adjusted in rather a peculiar manner. Possibly the jet level is incorrect. This may be readily tested by means of the special jet supplied with all Amac carburetters. The level should just reach the top of the test jet.



2¾ h.p. touring model A.J.S. for 1915 showing sloping top tube—a feature of all the new A.J.S. models. Drive is by chain throughout, and purchasers have the option of a two or three-speed gear.

Cylinder Pressures.

Could you tell me the pressure exerted on the walls of a cylinder of a 3½ h.p. engine when pulling on a stiff hill?—V.C.

You do not state whether you wish to know the explosion pressure above the piston or the side pressure exerted on the walls by the angularity of the connecting rod. Both these points depend almost entirely upon the design of the machine and the speed at which it is running. Such points as compression pressure, length of connecting rod, etc., are of the utmost importance. A rough estimate of the compression pressure of the average 3½ h.p. machine is about 75 lb. per square inch. Running on full throttle at comparatively low speeds, this would give an explosion pressure of somewhere between 250 to 300 lb. per square inch.

Auxiliary Radiators.

I should be very much obliged for your opinion on the Harcourt radiators, and whether there would be very much advantage in using these on a 1914 2¾ h.p. Douglas? Also, if they are difficult to fit? Is Oildag a good thing to mix with Huile de Luxe, and will it help to give more power? In setting the single point plug of the Bosch and similar pattern, would you set it so that the gauge of the magneto spanner can just be pushed between the point and barrel?—E.H.

Undoubtedly the radiators are satisfactory, but we doubt if it would be of very much advantage to put them on your present machine, as it is fitted with an engine which is not at all given to overheating. Oildag is an excellent preparation which lengthens the life of the bearings and does away with the necessity of oiling so frequently, but it naturally does not materially increase the power. The plug gap suggested is not quite sufficient.

A Broken Piston.

(1.) Can you tell me why my right cone keeps winding up so tight that the wheel will not turn? I screw up the nut quite tight; in fact, you would think it impossible to move. I took off the cone and found several of the balls worn on one side. Do you think this is the cause of it? (2.) While out for a ride last week, going along the road about 12 to 15 m.p.h., the gudgeon pin broke in two and piston smashed into small pieces and bent the connecting rod up. The piston and gudgeon have run about 2,000 miles. What do you think could have caused it? It was not overheating, as I had only gone a mile and a half when it happened. I have heated my connecting rod and straightened it. Do you think it can be used again, or will this have weakened it in any way? (3.) There is a slight crack running round the tongue of the cylinder that enters the crank case: it does not run up the cylinder. Do you think that will matter at all? (4.) The cylinder has several slight scratches and marks on the walls. If I rub them down with emery do you think it will need grinding?—H.M.

(1.) Possibly the worn ball race is responsible for the screwing-up of the cone, though we have an idea that the right-hand cone should be screwed till it comes against a stop, the left-hand cone only being free for adjustment. A note to the makers would clear up this point, but we imagine that a new ball race would overcome the trouble. (2.) It is impossible to say what caused the breakage. In all probability the metal had become fatigued, or was possibly over-hardened. There is no reason why your connecting rod should not be used again, provided it has been absolutely trued up. (3.) The crack in the cylinder spigot should not matter in the least, but we should advise you to drill a very small hole at either end which will prevent the crack from spreading. (4.) We should not advise you to rub down the cylinder with emery. If the scratches are very slight you will not suffer any inconvenience from them. If, on the other hand, they are sufficient to allow the compression to pass, the cylinder will need regrinding.

No Power on Hills.

Can you help me with my 3½ h.p., which has just returned from the works after being overhauled? It has a Roc two-speed gear and B. and B. carburetter, 32 jet. It has plenty of power on the stand and seemingly on the level, but when it approaches a hill it gives up the attempt. It takes, with 32 jet, about equal air and gas, and with a 34 jet all air and little gas. Everything should be in order, as it was supposed to have been tested at the works. The gears also seem to slip till pressed hard. The timing is correct and the spark perfect.—H.E.

It is impossible to say what is the matter with your machine without examination. Apparently, something is binding. See that your gear bands are absolutely clear of the drums when not in operation; also check the spark timing, which may be late. It appears that if your engine has been overhauled, either piston rings or bearings are on the tight side. This will, of course, wear off after a small amount of running.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.W.F.H." (Gateshead). — Mabon gear. Efficiency and durability.

"H.L.W." (Truro).—A durable belt for expanding pulleys. Also running costs of 8 h.p. Zenith and sidecar.

"C.W.F.W." (Monmouth).—2 h.p. Calthorpe Junior. Consumption, speed, gear, and wearing qualities.

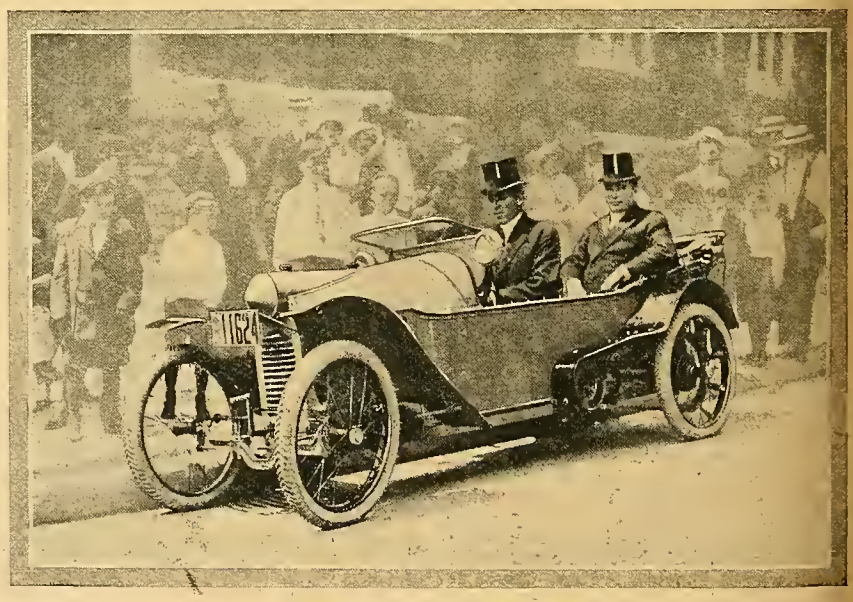
"J.B." (South Shields).—2¾ h.p. twin single-geared Premier for sidecar use.

"J.F.O." (Dublin).—2½ h.p. single-geared Sun-Villiers or Sun-Vitesse. Hill-climbing, speed, consumption, and general reliability.

"S.P." (Yorks).—3½ h.p. Douglas for sidecar work. Power, reliability, hill-climbing, consumption, and most economical carburetter.

"H.C.A." (London).—1914 Calthorpe Junior. Reliability, speed, consumption, hill-climbing, and upkeep.

"R.H.C." (Somerset). — Harcourt radiator on any 3½ h.p. sidecar machine, but particularly Humber. Also Badcock's bypass with a B. and B. fixed jet carburetter; reduction of jet, consumption, and whether paraffin can be used without drawbacks.



THE CYCLE CAR IN CANADA.

The first Toronto clergyman to own a passenger vehicle of this type photographed with his organist. The machine, it will be noted, is a tandem seater and belt driven.

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 24th, must be closed for press earlier than usual. All copy and instructions for paragraph advertisements in that issue must therefore be in our hands not later than first post on Thursday, Dec. 17th.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C. end good second-hand machines of all makes, very cheap.—Morgan and Maxwell, 80, High Rd., Streatham. [X5068

A.B.C., 3½h.p., 1915 models, 4-speed, gate change gear box, laminated springing fore and aft.—Agents, Alf. Wray and Culshaw, Southport, Lancs. [9627

Always the best motors—and *now* —the new models.

AND beautiful machines, too, just brimming with new touches that seem final in the effort to provide every possible comfort and convenience for the rider and to ensure the lasting service of the machines. Whatever your requirements in power, weight, or price, there is the newest model of the recognised and proved best make in its class to be seen at Colmore Depots.

The Levis Featherweight. The little 2-stroke machine that has always led the way. It is just the machine for the business man—slow in town and fast out.

The Douglas. The lightweight, undoubtedly. The 1915 models are further ahead of competitors than ever. There is only one trouble—the Government want so many for use in France.

The Matchless. The big, generous twin, that no work comes amiss to. It makes light of sidecar loads, and gives its rider that confidence and supreme enjoyment that comes of controlling something so fine and so powerful.

The Morgan. The racy little runabout. Costs no more to buy and run than a sidecar outfit, and requires little, if any, more room to garage. We are now happy in the possession of a further delivery of the latest models.

And we have also the newest models of the **Scott, Premier, Calthorpe,** *and the* **Sun,** *for which makes we are Sole Agents, and all of which we can strongly recommend as excellent.* **Triumphs** *and* **Enfields** *also in stock.*

Come! let us show you the newest models of all these fine machines. At any of our Depots you will have the undivided attention of an expert assistant to explain all you desire to know, and demonstrate all you care to see.

Deferred payments if desired.

SECOND-HANDS.—We have in stock a fine lot of second-hand motors, in which there are tremendous possibilities for service and satisfaction. We know the history of them all, and each has been thoroughly overhauled and tuned up by our own mechanics. Real bargains, every one.

1914 MACHINES AT 25% OFF LIST.—We still have a few 1914 models—mid-season deliveries—to clear, and are offering at the particularly low price of 25% off list.

Christmas 1914.

THE thoughts appropriate to Christmas Day are all closely associated with the idea of "Peace on Earth and Goodwill towards Men." Unfortunately, this year such words seem somewhat out of place, much as one may wish for an end to the present terrible conflict which is raging over almost the whole world, and a lasting peace. Even the armistice suggested by the Pope for Christmas Day has been found to be impossible, and for once Shakespeare is wrong when he says in *King John*, III., 1:

> "The yearly course, that brings this day about,
> Shall never see it but a holiday."

There will be no holiday for our comrades at the Front, and the best that we can wish them is victory in the day of battle and a safe and speedy return, when they may be sure of a right royal welcome.

Mudlarking with War Despatches.

THE grumblings which we are continually hearing about the almost indescribable state of the roads in the war zone, and the difficulties under which despatch riders are pursuing their important work, have led a number of croakers to assert that a motor bicycle is not the best vehicle for the work. But we want to know if any motor vehicle in France or Belgium at the present moment, whether small car or heavy lorry, is able to perform its duties without difficulty and without criticism? It seems beyond the comprehension of some people that single-track machines can be ridden at all over roads deep in mud and abounding in pot-holes and deep ruts. They do get through, however, and when a fall is experienced, the intrepid rider is usually able to haul his machine single-handed out of the ditch, and is soon pursuing his journey again, and in a mile or two has forgotten the experience.

Realising the rapidly deteriorating road surfaces and the extreme difficulties of the winter campaign, we have urged the adoption of sidecars for despatch riders; but we hear that in semi-official quarters cars are being recommended on the score that they can be piloted over surfaces that motor cyclists cannot face. *The Motor Cycle* is not disposed to agree with such a suggestion, and points to the results of the different Six Days Trials as support for its conviction. We contend that an expert motor cyclist, well mounted, can follow a car anywhere, and that on extremely bad surfaces a rider of a single-track machine is better off, as he can pick the best track. The talk of eighteen inches of mud does not move us from our view. A car would flounder and get hopelessly stuck in such a mud-hole; and if a motor bicycle did get stuck, it is very easily removed single-handed. In this connection we certainly think that a larger number of lightweights should be utilised by the Government. Mudlarking is excessively discomforting at all times; and though deep mud and pot-holes may affect a motor cyclist more than a car driver, every type of vehicle is affected more or less, and such conditions emphatically do not, and need not, deter a motor cyclist from delivering his all-important despatch. It seems to us that the final balance which should settle the question is the extremely serious one of the road surfaces disappearing altogether. Which type of vehicle has caused the damage? The answer being obvious, it is not likely that more road surface destroyers will be employed when the harmless and simple motor bicycle will perform the work equally well, at a lower all-round cost (a comparatively unimportant item in war-time), and last, but by no means least, take up but the width of a yard or so of the all-important roadway.

THE LIGHTER SPIRIT.

ON SYSTEM.

THE motor cycle, like every other piece of machinery that I have heard of (with the exception of dynamite bombs), is a concrete epitome of system. System in this sense is usually defined as method, and reciprocating or rotatory parts, which (respectively) go up and down or round and round, and then promptly proceed to do the same thing over and over again till further orders, represent method with a vengeance. But all the same you will remember that Hamlet's madness had method in it, so that even dynamite bombs can hardly be ruled out—or anything else, for the matter of that. Dynamite bombs are systematically unreliable. Some people are systematically unmethodical. So where are we?

. . . . . .

Let us try to get out of it in this way. When manufacturers and editors advocate system in whatever care and attention you intend to bestow upon your machine, they mean you to be systematically systematic. The manufacturers have done their part in seeing that the cylinder opens its mouth and gulps in a fresh draught of gas at regular intervals, and does lots of other things of that sort. But they cannot arrange any mechanism to compel you absolutely and without option to coax the dirty oil out of the crank case every three or four hundred miles. Some people, who are all for mechanical improvements, think that this is rather a pity. Others who are rather tired of hearing the manufacturers get *all* the blame when things go wrong think so to. Besides, see what humour might be imported into the sport by a little device of this kind. It might be arranged that at every three hundred miles an alarm bell should come automatically into operation. This would go on ringing—getting gradually louder and louder—till the three hundred and fiftieth mile. Thereupon the machine would come automatically to a standstill, a pair of strong steel arms would seize the rider, hurl him from the saddle, and plant him with his nose just touching the little plug in the crank case. Then he would remember (I hope), and he would not be able to get another tenth of a mile out of his odometer before he paid his tribute to System.

. . . . . .

But I don't think this arrangement is likely to be among any of the 1915 improvements. You know what the manufacturers always say when any intelligent detail of this sort is suggested—"introducing too many complications." As if one or two extra could make any difference! But they might make us a little more inclined to be systematic by arranging that a rather larger proportion of the crank case surface should be removed, don't you think? I knew a youth once who unscrewed the plug, found that only one or two tired oozings of oil emerged, jumped at once to the conclusion that his pump had not been working properly, and promptly dismounted the cylinder and dismantled the crank case to see what sort of state the bearings were in. Of course, he got the oil out then, but it was a lot of trouble for such a small job, and his enthusiasm for System was consequently damped.

. . . . . .

I remember once making a good resolution which I thought would constitute me a model rider and my machine a perfect one hoss shay for reliability. I proposed to go in solidly for System, and with that end in view I chalked up the following "writing on the wall" of the motor house, to be a perpetual reminder to me:

"*Lubrication.* Eternal automatic (thank 'Eving!). All the same, make sure of this every ten miles." (As if one passed every ten miles in the motor house! That occurred to me afterwards.)

"*Lubrication sundries.* Oil hubs, races, spring forks, and all other minor bearings every two hundred miles. Re-fill countershaft gear box with oil same period." (Quite the little "Ixion," you see.)

"*Nuts.* Have a look at these every 250 miles." (All kinds of Nuts are inclined to be loose in the head, but personally I'm a little tired of looking at them.)

. . . . . .

I needn't go any further, particularly as in actual practice I never went so far. The truth is, I got rather shy of the whole affair, owing to an experience I had in the London-Exeter last Christmas. I played sidecar-passenger to a serious and thoughtful youth who proved to be a very stern advocate of System. He kept his speedometer lighted up all the time, and he also had on his handle-bars an illuminated chart telling him what he had to do at different mileages. (I hadn't noticed this beforehand.)

Fifteen miles out he stopped "to put another five pounds pressure in the tyres."

"Good Lord, man!" I exclaimed, "why didn't you do it before starting?"

"Wasn't the proper mileage," he replied. . .

. . . . . .

At nineteen miles he stopped to give his contact-breaker a wipe with an oily rag. At twenty-five miles it was time to adjust his chains. At twenty-six miles he went round all the nuts. At thirty-seven miles he emptied the oil out of his crank case. At forty-two miles, in the thick of the downpour, he got out a tin of Brasso to polish his plated parts. He said it was System.

. . . . . .

At forty-three miles—don't believe me, if you find it too much of a strain on the engine—his back tyre punctured, his rear chain broke, and his piston seized. I'm inclined to think that that was System too.

WILFRID BLAIR.

An Amazing Yarn.

A motor cyclist recently asserted in my presence that he started up the engine of his Scott sidecar outfit, and on letting in his clutch was astounded to find the machine progress rapidly *backwards!* I thought he was pulling my leg, until he got annoyed, and summoned his wife, who immediately corroborated the yarn in every detail. I once owned a small car, the engine of which (a four-stroke V twin) would occasionally run fifty or sixty revolutions reversed; and I found the plotting of its faults worse than chess problems. As I have just bought a new and rather expensive hat, which I do not wish to outgrow, I will not tackle the truth or falsehood of the above experience personally.

Those Details!

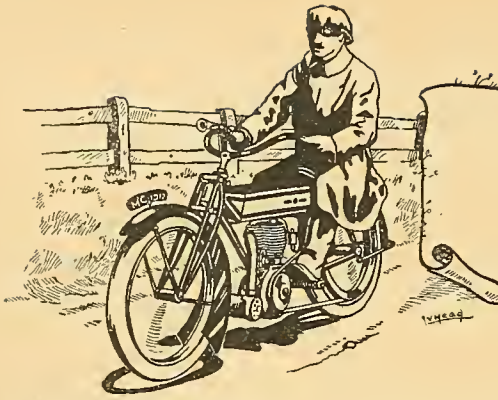
I live in constant fear of getting the sack. The war is no golden opportunity for technical journalists, and, as our staff includes several genuine veteran motor cyclists, I am not doing the work of eight men who have gone to the front. When the fateful Friday comes, my plans are all complete. I am going into business as consulting engineer to the motor cycle trade. Did I hear you scoff, gentle reader? I admit I am, technically, a gross ignoramus; but I propose to assist the trade to eliminate the faulty practical details from their machines; and how few machines are not disfigured by at least one such eyesore. I hear to-day from a man who owns a machine which has a colossal factory behind it. He had a front wheel puncture last week, and when he propped up the machine on it, the stand "wilted like a tired lily." Last week I met another man who owns a machine which is supposed to be as near perfection as motor cycles can be in a world still capable of producing Kaisers. He had occasion to repair his compression tap; he found it could not be removed without taking down the entire engine, and even then a special tool had to be made before the errant tap could be disintegrated.

Electric Lighting on Motor Cycles.

Anybody who has kept touch with garage experience during the year now closing knows that, despite the sudden and enormous boom, electric lighting has not always proved an unqualified success either on cars or cycles. I have encountered very few instances of dynamo failure—surprisingly few instances, if one recalls the poverty of the results obtained with official R.A.C. tests of such devices: but owner and repairer alike testify that light, cheap ignition batteries are too commonly employed for lighting purposes. As the old brigade well remember, the small ignition battery never stood up particularly well on motor cycles in the days when it was carried for ignition purposes. Under these conditions it was discharged very slowly indeed, and its electrical duties were entirely favourable to durability. When a similar battery is used for illuminating duties, it is discharged very rapidly, and is working under peculiarly arduous conditions. It is discharged with great rapidity, and if the dynamo is available to utilise every idle moment for recharging, the time available for recharging does not compare favourably with the old days, when a similar battery was removed from the machine and left on charge for twenty-four hours at a time. As a consequence, many cars and cycles have burdened their owners with heavy expenses for the repair and renewal of light and unsuitable batteries. The fact is, that in the present stage of electrical invention, such lighting outfits really require much heavier and bigger batteries than can be stored on a motor cycle. The millionaire, who buys and equips his car regardless of expense, employs these gigantic and costly batteries alike for his Klaxon and his lamps; but the light car man and the motor cyclist are in some cases fobbed off with batteries that are not up to their work. They secure the cleanliness and convenience of electricity, but they most undoubtedly pay for it in increased upkeep charges, as compared with acetylene. The owner who it willing to accept the admitted compromise will be well advised to keep three batteries in commission and to let each battery undergo a prolonged charging at regular intervals on the board at his local garage. Some of the smaller garages are inclined to grumble at the boom in electric lighting, as their customers are unwilling to pay charging fees which will render the bother of constant attention to the batteries genuinely remunerative. I believe that both "lump" and "bottled" acetylene will hold their own pretty sturdily until small batteries are considerably improved.

Fitting Dissolved Acetylene Cylinders.

The makers of the well-known D.A. cylinders recently asked me to provide suggestions for fitting these to motor cycles, and I have been experimenting with a variety of makes, in the hopes that some standard position might be evolved, but so far without success. The size of the cylinders and the frame design of the cycles have been arrived at without any co-operation between the engineers involved, and no standardisation is possible. If I were designing a motor cycle frame in the consciousness that most of my customers would use this illuminant, I should certainly leave space for it between the rear mudguard and the saddle-pillar tube, where it would not protrude unduly, nor interfere with the appearance of the machine. Failing this position, it can be made to lie very snugly along the top tube, a position I have utilised on one machine by fitting wooden rests; but this is really too high a location for a heavy fitting, and it obstructs access to the tank fillers. I am afraid that the sole expedient is to clip it to the saddle-pillar tube, nor does a little protuberance matter here, as the rider's legs come farther forward.



THE MESSAGE IN MORSE.

An Imaginative Incident of Warfare.

ONE must confess to a certain sympathy with Daniel Jenks. When you have laboriously established a wholesale grocery business capable of rivalling Lipton's in years to come, when fortune has favoured you with no more than one son, when your whole heart is set on that son succeeding to the business and in the business, when you have lived penurious days to give him a good education, it is undoubtedly jolly hard lines that the said son should throb with an inveterate dislike of ham, tea, butter, flour, ledgers, markets, and stools, idle away all his office hours, and only long for closing time in order that he may dabble in pursuits properly belonging to common mechanics. Yet this is exactly how Daniel Jenks, junior, served Daniel Jenks, senior. He had been in the office four years when the European war broke out, and, as his justifiably irate parent asserted, he knew less about the business than any smart seventh standard boy could learn in one year. The special evening classes at commercial colleges, for which Daniel the elder paid lavish fees, were seldom honoured by the presence of Daniel the younger. He was either at the local garage, helping the overworked mechanics with tricky repair jobs; or round at the Balham Wireless Club, taking down and transcoding the evening Marconigram from the Eiffel Tower; or tuning up his treasured motor bicycle, to which Daniel the elder, in incautious moments, applied epithets of which his brother deacons would hardly have approved.

In the Vanguard.

When war broke out, Daniel the younger instantly enlisted in the first batch of despatch riders, and his bosom chum, Williams, of course, went with him. Daniel the elder was speechless with rage for a week, and was only partially mollified by the idea of selling the business to a limited company, so that he could retire and spend his later years as a gentleman of leisure.

Meanwhile, Daniel, junior, and young Williams were having the time of their lives. They were out at the Front in time to share the thrilling business of feeling for contact with the enemy, and on many of their forward scouting rides it was always possible that a storm of Uhlan bullets might salute them from the most innocuous-looking cottage or tree clump. The men who went out later only knew the inferior thrill of carrying precious messages whilst a hidden foe sprayed the roads with assorted ironmongery from ten miles away.

But Daniel was not lucky. He emerged scathless from the preliminary scouting business, only to be taken prisoner in most unromantic fashion. The British Expeditionary Force had moved rapidly forward on rather sketchy information, and, running unexpectedly into the Bosches, found it prudent to pause and collect news. In one local retirement contact was lost with a battalion of infantry posted at a forward salient. It appeared that the order to withdraw had failed to reach them, and at nightfall the colonel asked for a volunteer to scout forward again over the river in the attempt to locate them and bring them back. Jenks and Williams, the only motor cyclists with the unit, instantly stepped forward. "Toss up!" said the Colonel laconically; "I can't risk both of you." Williams spun a franc; Daniel called, and won. The pals wrung hands. "Blow your exhaust whistle, old man, if they cop you," was Williams's farewell; "I should hear the old nightingale two miles off."

A Prisoner.

Daniel throttled his engine down to a low silent speed, and, with lamp unlit, dodged carefully forward through the British outposts, down to the river, across the solitary bridge, and forward over the ridge which the British guns were ready to sweep at a moment's notice. The missing battalion had last been seen occupying a wood to the east of the first village along the road, and there were no by-paths. Daniel intended to go boldly through the village, and along a farm road he remembered, unless he met German sentries south of the village. Everything was as still as death; in the thick bluish gloom he could just verify his position by the silhouettes of tree tops and buildings against the dark sky, which still held a faint reminiscence of daylight. The outskirts of the village were reached—still no sign of the enemy. The first houses passed were all quiet, but as he cautiously rounded the blind corner leading into the main street of the village, he was knocked senseless, and awoke next day to find himself lying on a heap of straw in a barn, surrounded by wounded Germans, with a German Red Cross doctor bending over him. His head felt as if it were split in half, and was liberally swathed with bandages. The hospital orderly told him that a sentry had bowled him over with his rifle butt. After medical attention he went to sleep; presently someone waked him again, and he found a group of officers standing over him. From the deference his fellow patients exhibited, his interlocutor was clearly a man of very high rank. He was questioned in perfect English as to the strength and disposition of the British forces beyond the river. Though very much in the dark as to the exact strategic position, Daniel had carried some urgent calls for French reinforcements, and he guessed that our line

he Message in Morse.—

as too thin to hold the immense masses which the German military motors were rushing southwards. So e swiftly adopted a sensible role. Simulating considerable alarm, he at first refused to give any information; but when one of the officers began to be truculent, e pretended to be in a great panic, begged that his fe might be spared, and hastily reeled off a somewhat ncoherent statement multiplying the British forces by bout ten. "Delay," he thought, "will be invaluable o our chaps." The German general was evidently ncredulous, so Daniel gave the exact stations of two naginary French army corps, and a brigade of the amous 75 mm. guns, which were actually galloping p for dear life some twenty miles away.

The officers departed, clearly impressed. An orderly rought some soup, and when Daniel sat up to drink the wounded Germans saluted him with volleys of erision. Daniel's brain gradually cleared a little, and y irritating retorts managed to extract news that at east three German army corps were concentrated gainst the British troops in this quarter. He got very eary of the ceaseless insults which were showered n him, and not till the afternoon sun, beating down n the thin roof, made them all sleepy, did he get ny peace.

About 5 p.m. he was roughly dragged out to doctor is own Triumph. A German who had been riding it omplained it would not go, and no wonder, for the Bosch had neglected to oil it, and the big-end was half eized up. Dan hoped for a chance to mount and nake a dash for freedom, but two hefty sentries with xed bayonets stood over him, and no opening ccurred. By dusk he had got the engine nicely free, nd running pretty decently on the stand, though there as a faint scraping sound in the bush, which hinted hat his captors would not get much more work out of is beloved engine.

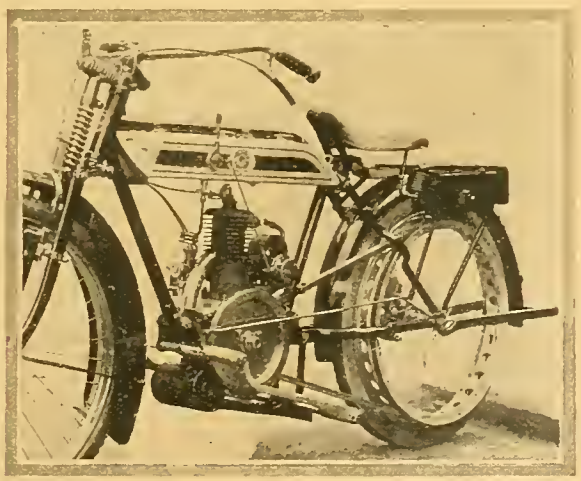
Unpleasant News.

As night came on, he was ordered to lean the nachine against the outside of the barn wall, and to o back to his straw. As he did so, a German officer ame out of the farmhouse, and, in answer to a query om a waiting subaltern, remarked briefly, "Attack force an hour before dawn!" You can imagine leep was impossible for Dan. There were, to the best f his knowledge, some 5,000 British troops comanding the crossing of the river, with not more than wo batteries of field artillery. So far as he had any nformation, they fancied they had no more than an dvance guard of Germans to deal with. A surprise ttack by one German army corps spelt lightning nnihilation, not to mention the flanking corps to ast and west; to the west, in particular, there could e no resistance except from a thin flanking screen of avalry. Nothing short of envelopment and annihilaion threatened Dan's late comrades.

One by one the wounded Germans dropped off nto uneasy slumber, and towards 10 p.m. the barn as as quiet as a big shed of wounded soldiers could ell become. Sounds of revelry proceeded from the armhouse next door, where the German officers were tationed. Dan crept stealthily to the door and peeped ut into the village street. The moon was up. No entries were visible. The men were evidently imitatng their officers upstairs. Helmets, overcoats, and rifles lay in confusion on the chairs and tables which stood by the roadside; their owners were drinking "Hoch to the Kaiser" in the kitchen indoors. There by the barn wall stood the Triumph.

It was the work of an instant to don a Bosch's overcoat and helmet, and to remove the Triumph's belt. Dan pushed the machine gingerly into the cowyard, and on through a gate into a field. Skirting the hedge, he began to make his stealthy way southwards towards the British position. He made frequent stops to reconnoitre, but, as he dared not show up against the skyline, it was impossible to see anything until, after a painful crawl of over a mile, he reached the edge of a wood just short of the low ridge which bordered the German side of the river. Long he lay motionless listening intently, before he dare approach the dusky wood, where German advance guards might well lie hidden. Satisfied at last that nothing was moving within a reasonable radius, he left the Triumph under a hedge, selected a tree which was well in shadow, and shinned up to its summit. The scene before him revealed the German plans in their entirety. On the reverse slopes of the long ridge, wholly shielded from the British sentries on the other ridge south of the river, he could dimly discern a battery of German guns, disposed in a long arc converging round the head of the single bridge, and laid to deluge the ground beyond the bridge with a perfect inferno of shrapnel at point blank range. Similarly concealed below the ridge were dotted small parties of Germans, each consisting mostly of sleeping men, but with a couple of sentries just covered behind the ridge, and a white flag set on a low mast a little further back, to guide the various German units to their rallying points prior to attack. Some distance to the right and left of the bridge lay what looked like pontoon trains, ready to throw extra bridges over the river during that palpitating hour before dawn, when no suddenly awakened man has full stomach for a fight.

Gallant and careless on the ridge beyond the river there stood out an odd British sentry or two, evidently unsuspecting that the Germans were in any great force. The Germans had an entire battalion with machine guns bivouacing in good cover immediately north of the bridge head.



Power plant of the two-stroke Radco. The single-cylinder engine has a bore and stroke of 62 mm. x 70 mm.

Message in Morse.—

Dan had never felt so miserably helpless in his life. Even if he had possessed firearms, one resounding shot might be mistaken by the British for a fit of nerves on the part of a jumpy sentry. What in heaven or earth could he do to make the British retreat without delay?

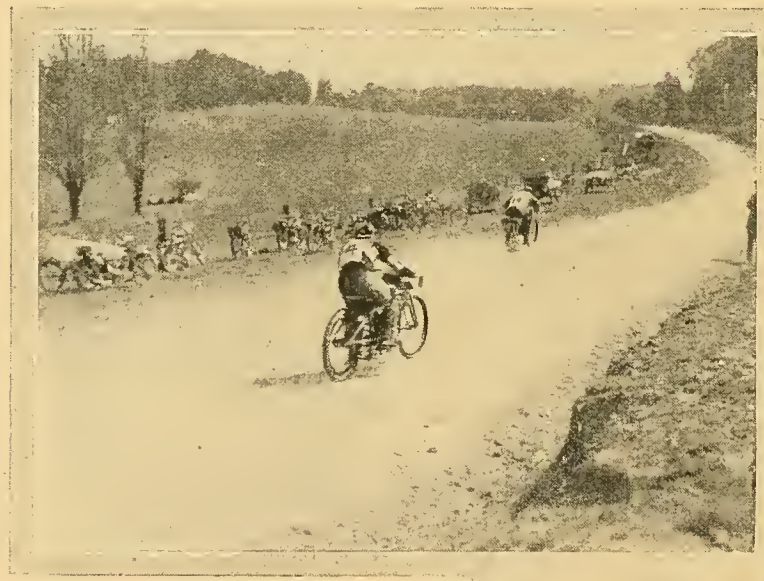
His plan was soon made. Midway between two clumps of Germans, separated from each other by 400 yards or so, a field hedge, bordering a ditch, ran clean over the ridge down to the towing path.

Dan collared his Triumph, with something of a lump in his throat, knowing what his plan might entail. He worked along a cross hedge, gained the ditch he had spotted, and in the course of forty-five minutes worked his stealthy way, Triumph and all, wholly unseen, right down to the towing path. Alas! The corresponding ditch on the British side of the river was lined with Germans. Here and there he distinctly spotted a machine gun. The British sentries on the top of the opposite ridge were a good half-mile away—out of shouting distance.

There was but one thing to be done, and he did it. Remaining in the shadow of the hedge bordering the towing path, he found a piece of hard ground, and put the trusty Triumph on its stand. He carefully verified all the levers, flooded the carburetter, injected petrol, and got in the saddle with the bicycle on the stand. One last tense instant of mental recollection and he started the engine. The second fired it; giving it half throttle and full air, he opened the exhaust whistle which sent its wild eerie screech far and wide over the countryside. Then he shut the whistle for a few seconds. Then, alternately opening and shutting the whistle in long and short jabs of the lever, he sent out in Morse the private code word with which he and Williams used to call each other when they conversed in Morse at the Balham Wireless Club. He repeated the call again, knowing his first screech would awake William if he were in range, and that the second would say "I am calling you in Morse!" The call word repeated, he began to spell out in dot and dash whistles the message for which he gave his life—"Three corps attack before dawn—retreat at once."

"Who Dies if England Lives."

Williams was with the British advance guards, and he happened to be awake when the nightingale whistle sent out its first wild despairing screech. But he did not know why the Morse message ended abruptly at the word "retreat" until many months later, when a crestfallen German officer told him in Berlin. "The pluckiest thing in the whole war, sir! I do not mind defeat from a nation which breeds such heroes!"



SCENES DURING THE GRAND PRIX OF AUSTRALIA, ORGANISED BY THE M.C.C. OF MELBOURNE.

(1.) Edgar Meller (2¾ h.p. Douglas) and Sinden (3½ h.p. Zenith) on the eighth lap. Observe the motor cycle ambulance on left, which is the gift of the pupils of the I.C. school, which has been brougth to the Front by the Australian Expeditionary Forces.

(2.) The winner, Edgar Meller (2¾ h.p. Douglas), who averaged over 41 m.p.h.

(3.) Kirkonnell turn, a dangerous corner of the course, where several of the riders came to grief.

Some Notes from a French Despatch Rider.

WE have been fortunate enough to secure many interesting stories from despatch riders attached to the British Expeditionary Force, but hitherto motor cyclists have not been privileged to read the experiences of our French allies.

From the remarks of a contributor, we shall see how vastly the organisation of the French motor cyclists differs from our own, and how much France has suffered from neglecting the pastime which we British have so zealously nurtured during the last twelve years.

A well-known French competition rider serving his country—M. Vallée-Picaud, who holds the Clyno and Bradbury agency in France. He is in the 22nd Regiment of Artillery, and uses both a Clyno and a Bradbury.

The Uniform.

"We wear uniforms of all branches of the Service," our informant writes, "though our own is a close-fitting blue jacket with four pockets and a low collar, on each corner of which there is a motor cycle in red cloth, while on the arm is the letter 'A' (Automobile). The breeches are of red, and puttees blue. On the whole, it is a fairly practical outfit. But as there were too few of these uniforms, many wear that of the artillery—a short tunic reaching to the waist with no pockets, which is most inconvenient, blue breeches with red piping, and blue puttees. As the roads are very muddy in the north, many of us wear leather gaiters.

"We are all armed with cavalry carbines slung round the shoulder, and carry a bandolier with cartridges, three in each clip. In winter we wear an infantry cape, in which the pockets are inconveniently placed behind the garment.

"All our machines are provided with luggage carriers, on which we carry a pack a foot high containing our personal belongings, so the machines are well loaded.

"Despite all our troubles, we motor cyclists are in excellent spirits. After our long rides at this time of the year, and the many side-slips we have, we return wet and muddy, and yet find time to amuse ourselves in various ways. One of our men got hold of a pair of gloves the other day, and we had some real English boxing—time-keepers, judges, and all complete. Others enjoy wrestling. The other day our Staff was installed in a château where there was a tennis court on which we could play. Sometimes a player would be called away in the middle of a game, and when he came back he would wait till another man came along before he could resume his game.

No French Motor Cyclist Officers.

"Unfortunately we have no motor cyclist officers like our English friends, a point on which I lay especial emphasis, because, unless a man is an active rider, he cannot adequately realise the conditions.

"Our journeys run from 90 to 130 miles a day in summer, but about 35 miles a day in the heavy and skiddy roads in the Aisne district. Our job is to accompany the cars belonging to the Staff to the line of fire, to carry despatches to the trenches, to bring the enemy's intercepted wireless telegrams to headquarters, to accompany convoys of heavy transports of food or ammunition, and to fetch help and spare parts to stranded lorries.

"When we meet our good friends, the British motor cyclists, we greet them with a hearty handshake, and exchange souvenirs in the shape of buttons and pots of jam. We greatly admire the English machines, especially as regards their comfort and the excellence of detail in the smallest accessory. The most cordial relations exist between the French and British motor cyclists, and when one of us is charged with a mission to General French's staff or other British headquarters he returns perfectly enchanted with the cordial reception he has received. We shall have happy remembrances of the British Army, which we shall bear in mind all our lives."

A French despatch rider taking cover in a wood. The photograph was taken near Soissons by the driver of an armoured car.

We now give a few extracts from some rough notes written by our correspondent at a place in France called by the English soldiers "Villagers Cottages," which is not a bad rendering of its true name.

Some Impressions on Mobilising.

"Men of all ages presented themselves at *les Invalides* with their machines. French motor cyclists are probably as good mechanics and as good riders as their English comrades, but our manufacturers have turned out motor cycles without gears or clutches, which did not matter so much in August and September, but since the roads have become muddy through the rain and cut up by the artillery, the machines, slowed up by convoys, knock themselves to a standstill on the slightest pretext. Our officers are doubtless competent enough, as far as cars are concerned, but know nothing about motor cycles.

Incompetent Repairers.

"The repairing of the machines is grossly neglected, and none of the mechanics attached to the artillery workshops understand motor cycles. These repair lorries are mere accessory stores,

A group of French military motor cyclists. In the centre is a well-known competition rider, M. Touchet, French agent for the Regal-Green. He reports that his machine has given great satisfaction under trying conditions.

Notes from a French Despatch Rider.—

and have not the tools for repairs, while those of our English friends are excellently equipped, and one of them turned out the other day a complete crankshaft for a car belonging to our staff. Not a bad performance! I fancy.

"The worst of it is the French motor cycle corps was organised in a hurry at the moment of mobilisation. We have all types of machines—English, French, German, and Belgian—as well as several nameless mounts constructed from parts coming from goodness knows where. And the trouble of getting spares, the delay and the amount of red tape involved are appalling. The best foreign machines are the English, which are greatly admired, as are also the officers in charge of the riders. The makes I saw most of were the Triumph, Rudge, B.S.A., and P. and M., and I was especially taken by the Douglas, owing to its easy starting and the way it holds the road in the grease. I wish I had one of these most attractive machines.

"In bad weather I advocate the fitting of sidecars, as without them the riders unwittingly become acrobats. The other day one of our men captured a Wanderer from the German Army. This is now used to carry news to the allied troops, to whom Victory will soon hold out a crown of laurels."

E.F. (MILITARY MOTOR CYCLIST ATTACHED TO THE FRENCH ARMY CORPS).

Feeding the Guns.

WE have received the following letter from W. Pratt, the erstwhile rider of a P. and M., who now drives a heavy lorry in the Ammunition Column attached to the 116th Heavy Battery, R.G.A.:

"I have just been reading a copy of *The Motor Cycle* (December 3rd), which, by the way, is the first I have seen since I have been out here, now over two months, and, as you know that I am an enthusiastic motor cyclist, you can guess I have been reading this copy with 'some gusto,' and the events described therein bring back many memories of days gone by on the good old P. and M. and others in Six Days Trials, London to Edinburgh and Exeter, etc.

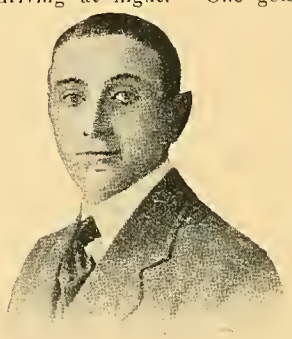
"At the present moment we are sleeping in a house—on the floor—which is the first time we have been billeted in such comfortable quarters since I have been out here, so you can guess we generally have to rough it. I am writing by the light of two motor lamps taken off a car, as gas or electric light is unknown in this village.

Light Vehicles must make Way.

"I see many names of men in *The Motor Cycle* who, I should have thought, would have long ago been with us out here, but no doubt they have good reasons for staying where they are. I would like you to convey my congratulations to Georgie Brough on his performance in the Bristol Trial. It is like him, and what one would expect; but you can tell him from me he would often have his work cut out to average 20 m.p.h. over here on these roads and the traffic. It is a common occurrence to meet a single convoy of forty motor lorries, and when you meet these there is no other place for you but the ditch or the side of the road, which much resembles a ditch. The convoy have orders not to get off the crown of the road (generally *pavé*) for lighter vehicles, as if one of these lorries (sometimes with a load of three or four tons of ammunition or stores) gets 'ditched' it may take anything from half an hour to get it out, and you can appreciate what trouble and delay that causes to other traffic, and many bad words are used by every one concerned.

"Bob White and myself are on the same lorry (40-45 h.p. Maudslay), and we intend to stick together if possible. We have had many interesting experiences, which are too numerous to mention here. We have only ditched our lorry twice, and as on neither occasion has it been our fault we call our sheet a clean one. Our work is very interesting, as we take up ammunition to our battery, and, in consequence, we are always well to the fore, and very seldom sleep out of sound of the guns, and generally on our lorries, which may have anything up to 100 rounds of lyddite or shrapnel. For the first month we were well in the thick of it, and saw many interesting sights. What would you say to a hole by a 'Jack Johnson' big enough to put two lorries in and then not know they were there? Some hole, eh!

"At the present moment we are supposed to be resting, but any time orders may come for a move, and then it means at any minute, night or day, and it is no joke driving at night. One gets very little rest as, perhaps, the battery particularly requires lyddite, or shrapnel, as the case may be, and it has to be got there in the shortest possible time, no matter what the obstacles.



Mr. W. Pratt, who recounts on this page his experiences driving an ammunition car with the British Expeditionary Force.

Knowledge of French Useful.

"I have seen a lot of praise given to the motor cycle riders, which, without doubt, they deserve, but those of us who have taken on this work of driving these big, heavy vehicles, perhaps for the first time, have many difficulties to overcome, which require a considerable amount of skill and nerve. At night one must never leave the lorry unguarded for one moment, which necessitates one doing guard while the other man sleeps in the lorry.

"The other difficulty always before us is being 'ditched,' which is very easily done; more easily than you can imagine with the good English roads before your eyes.

"Just before I close I would like to mention that I have found my knowledge of French very useful, and I generally act as interpreter to the column, and hope to be able to use my German in a similar manner when we arrive in Berlin!

"As I write, I have just heard we are off into action again, so to-day has been a busy one with us. I cannot tell you where we are going, but when our guns start you will soon hear of another German retreat, and that is how 'I do my little bit' by serving the guns which give the Germans a nasty shock every time a shell leaves the muzzle. I forgot to mention our guns are the guns of South African fame, 4.7, so you will have some idea of the damage they do.

"With best wishes for Christmas and a happy New Year to you and all those readers who remember me.—BILLY PRATT."

THE MACHINE REQUIRED.

IT is with pleasure that we reproduce a letter we have received from Lance-Corporal D. H. Noble, the Rover rider, now serving with the 69th Company A.S.C. (M.T.) It is such an interesting communication that we reproduce it *in extenso*:

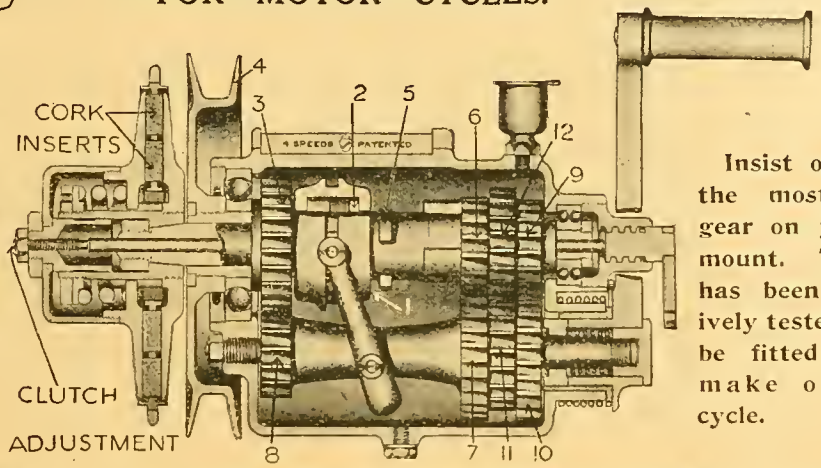
"The weather and roads are becoming really awful now—cut up by the constant heavy traffic and deep in mud soup. I was held up the other day by the deluge getting in the magneto, and had to take the whole thing down in a little *café* by the light of one oil lamp, finally arriving 'home' at 11.30 p.m. Incidentally, an Indian sentry, whose challenge I did not hear, nearly shot me. Otherwise the T.T. Rudge I have been riding has gone excellently, although, being gear and clutchless, it is hardly suited for 12 m.p.h. convoy riding, so I hope shortly to be astride a Douglas. To be suitable at all for convoying lorries a machine (unless it is a lightweight) must have a handle-bar controlled clutch, a gear emphatically *not* in the hub, and efficient spring forks which *will* hold the road (one type which I have in mind is absolutely a nightmare to steer over *pavé*). Protection from the wet and mud is also most desirable—we are rigging canvas mud shields on most of our bikes—as once one gets wet it is a difficult job to get dry again—no hot bath and a spare suit of clothes to change into after a long and wet ride at speed. Otherwise I am sure the British Army in France is the best looked after. There is plenty of excellent food and warm clothing. We motor cyclists have just received short leather coats, and the lorry drivers long fur-lined ones."

THE DINE IDEAL TRANSMISSION

FOR MOTOR CYCLES.

Amongst others the following British makers are now fitting Mark 10 as standard.

Abingdon Ecco Co.
Burney & Blackburne
Campion Cycle Co.
N.U.T. Motor Co.
Reed, H., & Co.



Insist on having the most perfect gear on your next mount. This gear has been exhaustively tested and can be fitted to any make of motor cycle.

FOUR SPEEDS. KICK START. CHAIN and BELT DRIVE.

MARVELLOUS PERFORMANCE OF J.A.P. ENGINE ON CYCLE CAR.

MELBOURNE to SYDNEY.

Extract from letter received from an Australian user of the J.A.P. Engine.

Australians argued that a J.A.P. would overheat where a . . . would not. It was then that I challenged any . . . or other engine (regardless of power) to do what I could do with my 738 c.c. O.H.V. J.A.P.; and I made it my business to meet these enthusiasts under all conditions, and finally, after completing the Melbourne to Sydney journey, I openly said (and say again) that no other engine than a J.A.P. would ever have taken me across that 600 miles of indescribable country, and in succeeding in accomplishing this journey, believe me, your engines have received the greatest test that ever an air-cooled engine has been subjected to, and had you yourself gone over the road beforehand, I am positive you would have said that I could never get there with 8 h.p. carrying the cargo I had on board, using a friction drive in the bargain. But I knew my engine and its capabilities, and although it roared in the low and slipping gear when the sand was a quarter up to the axles, it did not complain, but stuck to its task as though it knew it was a case of getting to the next township or leaving its driver to die of thirst—and a J.A.P. has never been guilty of that so far—and on those hills (or ranges) how it pulled when a nasty corner prevented a run, and a tree or two lay across the track. That was when anxious moments arose, but my faithful engine would settle down to business, and, although the ascent seemed slow, we would always get there, and in many cases I would jump out on the summit and look down those mountain slopes and marvel at ever having climbed them. At all events, the question of a J.A.P. overheating has been silenced for ever, and the J.A.P. is the most popular engine in Australia to-day.

"I feel as though it is my duty to inform you of the marvellous behaviour of your engine on my overland journey with 160° in the sun."

THE WONDERFUL SUNBEAM TRANSMISSION

BE QUITE CLEAR ON THIS POINT.

In May, 1914, Three Sunbeam Motor Cycles for the first time competed in the Tourist Trophy Race, and they won the Team Prize.

Very well! This most important Competition showed the supremacy of the Sunbeam Chain Drive—but not of any and every Chain Drive.

Remember that Sunbeam Chain Drives, and Sunbeams alone, combine the advantages of both Chain and Belt without the disadvantages of either.

A study of the 1915 Sunbeam Catalogue brings out this point, and all prospective purchasers should at once send for same.

Preliminary leaflet giving detailed specification will shortly be ready, and sent on application to:

J. MARSTON LTD., 11, Sunbeamland, Wolverhampton.

London Showrooms: 57, Holborn Viaduct, E.C.; and 157-158, Sloane Street (close by Sloane Square), S.W.

Another ROYAL RUBY

Have you seen the Royal Ruby War Map, Price 6d.? The best thing in War Maps on the Market.

PRICE.—Complete with Sturmey-Archer 3-speed gear and free engine hub ..... **36 Guineas**

Code Word: "Adelopode."

If desired, we can fit Banks 3-speed countershaft gear without clutch instead of Sturmey-Archer 3-speed hub gear, at the same price.

Code Word: "Adelosine."

MASTERPIECE.

Royal Ruby Modele de Luxe 2-stroke Lightweight, fitted with Villiers Unit.

Everything of the very best quality.

SPECIFICATION.

Frame.—Low built, soundly constructed, and with dropped back, giving low position, 28in. from ground to top of saddle; made throughout of "Royal Ruby" fittings, and best quality weldless steel tubing. **Forks.**—Druid new pattern lightweight, with extra springs. **Engine.**—Villiers 2½ h.p. 2-stroke, 70 × 70 mm., with c.c. 269. **Carburetter.**—Amac special. **Brakes.**—Bowden front brake, with outside lever and belt rim brake operated by foot pedal. **Belt.**—Dunlop ¾in. **Silencer.**—Twin type of special design. **Saddle.**—Brooks B 180 pan seat. **Carrier.**—Tubular. **Tank.**—Specially well made, holding 1¼ galls. of petrol and 1½ gills of oil, and fastened on two supports brazed to frame. **Lubrication.**—Through Best and Lloyd's sight drip feed with pump. **Control.**—Ignition and carburetter levers on handle-bar, compression release by outside lever worked by Bowden wire to handle. **Handle-bars.**—Semi T.T. or upturned (optional). **Mudguards.**—Deep section, with side shields as shown. **Stand.**—Good front and rear stands as shown. **Wheels.**—26in. × 2in., B.E. Roman rims, fitted with best quality hubs. **Footboards.**—Aluminium, as shown. **Bag.**—Brooks' side bag. **Tools.**—Fully equipped tool-roll. **Inflator and Clips.**—Celluloid inflator and clips brazed to frame. **Tyres.**—Dunlop, 26 × 2in., B.E., rubber studded motorcyclette tyres.

Write for Catalogue, giving full specifications of other models, from the 2-stroke Lightweight at 25 Gns. up to the 8 h.p. modele de luxe at 80 Gns

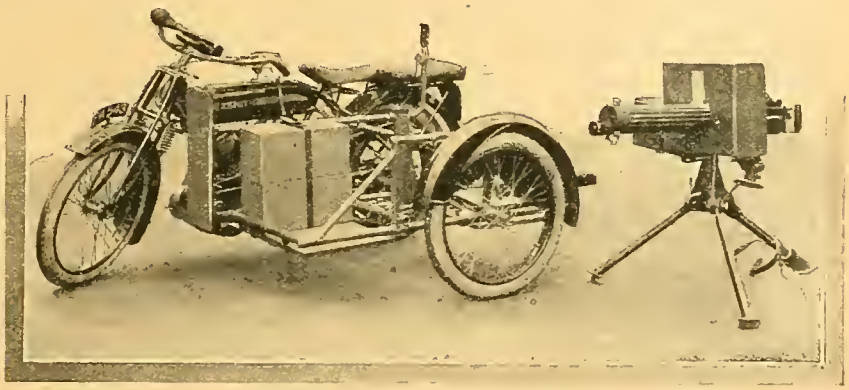
ROYAL RUBY CYCLE CO.,

Ruby Works, Cannel Street, Ancoats, Manchester.

The Zenith Machine Gun Sidecar Combination.

WE recently had an opportunity of inspecting a particularly fine sidecar outfit on which a quick-firing gun is mounted, Mr. F. W. Barnes, of the Zenith Company, being responsible for the design of the sidecar chassis. The sidecar is constructed throughout of straight tubes and is immensely strong. In the centre is a column supporting the gun, on which it is pivoted, providing an ample amount of lateral movement. A locking device holds the gun in position, so that it is held rigidly until its use is required; the gun may be worked either ahead or astern, as by undoing the locking screw referred to the gun may be lifted out, turned completely round, and used in the reverse direction. When the gun is in action a "spade," which is hinged to the near side sidecar member, can be let down so as to hold the combination steady while the gun is being fired. If the sidecar is lifted up and the leg pushed forward it makes an efficient sidecar stand.

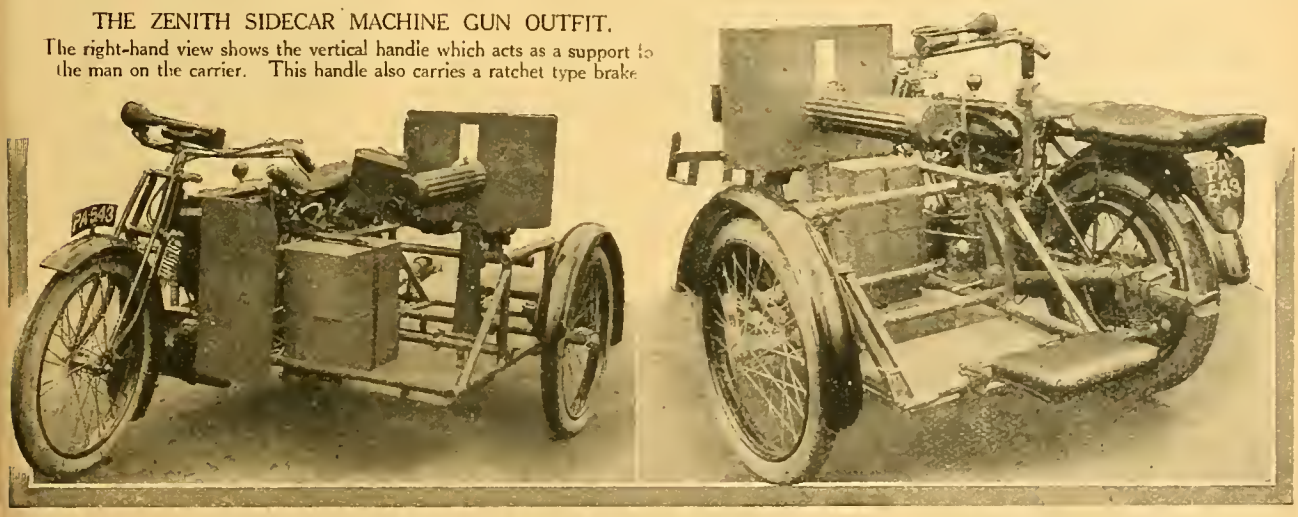
The quick detachability of the gun is an especially important feature, as, in the event of the combination arriving at a spot where further progress by road is not possible, the gun may be lifted up and the tripod shown in the illustration quickly detached and carried with the gun to a convenient position. A platform is provided upon which the gunner sits, and provision is made for the conveyance of ammunition boxes. A comfortable cushion is to be found on the luggage carrier, and also a handle to which one of the gun's crew can hold on, and to which is attached an auxiliary brake provided with a ratchet lever so that it will stay on in any position. The tripod rests on a spring carrier, and when in position acts as an efficient form of spring footrest for the passenger riding on the carrier. The gun used is the Vickers light machine gun.



Quick-firing gun dismounted from sidecar chassis and mounted on its tripod. This operation is the work of less than a minute, and is necessary on occasions when further progress by road is impracticable. The bicycle and chassis are Zeniths.

THE ZENITH SIDECAR MACHINE GUN OUTFIT.

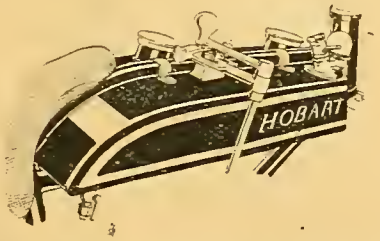
The right-hand view shows the vertical handle which acts as a support to the man on the carrier. This handle also carries a ratchet type brake



A Motor Cyclist with the Ambulance Service.

A RECENT issue of the *Ilford Guardian* contains an interesting letter which has been received from Sergeant A. R. Abbott, the well known motor cyclist and captain of the Essex Motor Club, who is attached to the 24th Field Ambulance Motor Transport, having charge of close on a dozen ambulance cars. The following are extracts:

"I will endeavour to give you an outline of our work as briefly as possible. Our hospital is situated about six miles from the firing line, which is about the limit of the range of shell fire, although now we do not take much notice of bullets or shells. The cars go to within one hundred or two hundred yards, and the stretcher bearers then walk the rest and carry back the wounded to us. As far as possible we stay behind an old farmhouse or cottage to shelter from the stray bullets, and there are plenty of them —*souvenirs d'Allemands!* On a dark night it is hell driving up there, and the roads (?) are awful, with ditches each side. We also have to dodge innumerable shell holes in the road that would take two tip-cart loads of ballast to fill up. We have had one car hit, but up to now nobody has been shot. We also had one car overturned in a ditch, and got it out two days afterwards under shell fire. We had to rig up a tripod of scaffold poles, and—although I say it myself—this was a smart piece of work."



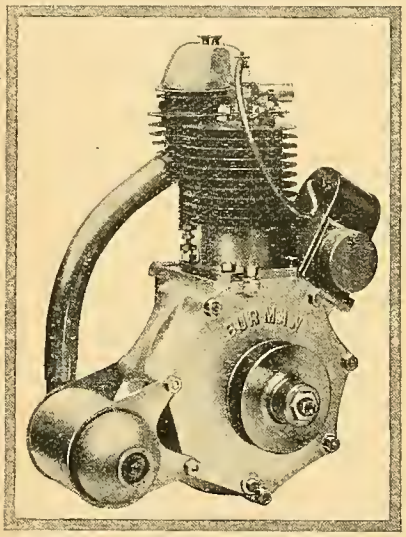
Tank of the new two-stroke Hobart, showing large filler caps, lubricator, and change speed lever. (See page 683 of our last issue.)

1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

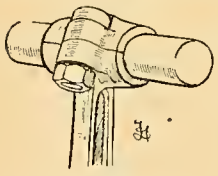
THE BURMAN 2½ h.p. ENGINE.

AT the present time, when most new productions in the small engine line act on the two-stroke principle, it is particularly interesting to find a well-designed and original small four-stroke. Such an engine is the Burman 2½ h.p. manufactured by Burman and Sons, Ltd., 89, Gooch Street, Birmingham.



Pulley side of the engine.

The enclosed overhead inlet valve and the crank case are the first points to strike the eye. The latter is of peculiar shape, for the bolt lugs are internal and their external radii are joined by neat curves so that the crank case can be wiped down with ease, and there are no ridges to collect mud. The valves are operated by a single cam, and the rockers are mounted in such a way that each has a long bearing surface on which to work. A Dixie magneto is mounted at a slight angle behind the cylinder, and is driven from the camshaft through a single intermediate gear wheel. A large silencer is attached to the front engine bolts, and is supplied as part of the unit. Dealing next with the cylinder, which has a bore of 76 mm. (the stroke being 65 mm.), the design is clean, and a clear air passage is left between the valve port and cylinder wall. The overhead inlet valve, complete with its seating and spring, drops into position from the top, and is held in place by a screwed dome. The inlet pipe casting, which is formed with the rocker bearings and cooling ribs, fits over this dome, and is held in place by a large diameter nut, and the rocker operates the valve through the medium of a small plunger, which prevents air leaks and takes up any side thrust. The inlet pipe is bushed to receive the inlet tappet rod, and the pipe is specially formed so that the bush does not choke the passage of the gas. Over the whole rocker gear fits an aluminium cap, precluding all grit, but removable for lubricating purposes by two small thumb nuts.



The gudgeon pin is fixed to the connecting rod by a split rod end

EDITORIAL NOTE.

ALREADY many full descriptions of 1915 models have appeared in these columns, and as a guide to readers we give below the dates upon which the different descriptions were published:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Abingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	22nd.	J.A.P. engines, Calthorpe, Lucas dynamo.
,,	29th.	Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2¾ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun Vitesse, and Levis.
,,	19th.	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p. Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.

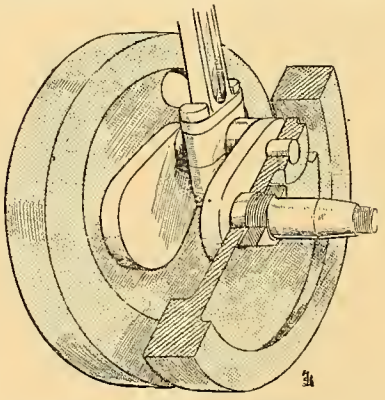
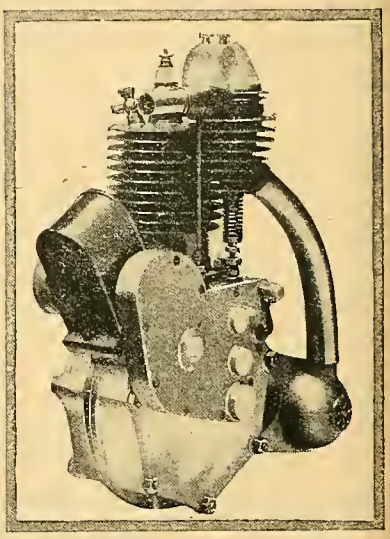
Dec.	3rd.	Norton, Grandex, Connaught, Brown, Clyde, Brough, and Lady's Ivy.
,,	10th.	Allon two-stroke, Wulfruna, Premier two-stroke, O.K. two-stroke, A.J.S., and Velocette.
,,	17th.	4 h.p. and two-stroke Triumph, Radco, and Paragon two-strokes, Rex-Jap, Symplex, Bat, Connaught, Quadrant two-stroke, Twin Excelsior, Hobart two-stroke, and Hockley two-stroke.



The Burman flywheels are attached to a solid crankshaft.



The 2½ h.p. Burman engine has an enclosed overhead inlet valve.

Novel Crank Construction.

Perhaps the most interesting feature of the engine is the crankshaft construction, which is quite unusual. The crank itself is a solid forging, hardened and ground to size. The crank pin is hollow, and through this is driven a pin which serves to locate the flywheels. The flywheels are internal, and the inner webs are set eccentric to their outside diameter, so as to provide correct balance. They are bored to fit the crankshaft, and have a hole to suit the positioning peg already mentioned. Consequently, they can be dropped into position and held on by locking nuts in such a manner as to ensure true running. This, unfortunately, is not a common feature on most inside flywheel engines, and materially affects high speed running.

The connecting rod carries a split big end of large dimensions, and the small end is also split and grips the gudgeon pin firmly, so that the pin oscillates in the piston. This method has much to commend it, for besides providing a much larger bearing area, no other gudgeon pin fixing is required. A ball bearing is fitted to the crankshaft on the

Where to go for Magneto "Spares"

ISN'T it time you overhauled that magneto of yours? Some of the parts may have worn and need replacing. It is far cheaper to do this now, than to wait until serious trouble develops, and the machine breaks down. We keep a comprehensive stock of "spares" for magnetos of *all* makes, and can send you any part, from an armature to a terminal, per return. Write for prices. They are low.

A MAGNETO HOSPITAL.

¶ We keep a staff of experts who do nothing else but repair magnetos; so if your machine is out of order, send it to us and we will make it as good as new. We despatch all work within 24 hours of receipt. We guarantee satisfaction with *all* makes.

THE NEW Simms Plug.

¶ The "New Simms" is a non-soot rustless plug which never misfires. It sparks perfectly at all engine speeds, even at starting. Ask your dealer to show you the plug in the blue tin box. That is the New Simms Plug—the best there is for motor cycles.

PRICE, EVERYWHERE,

Details of the Burman inlet valve, and dome construction.

pulley side, and all the other bearings are plain and of ample proportions.

Altogether the engine is an example of excellent design and high-class workmanship.

NEW COMETS FOR 1915.

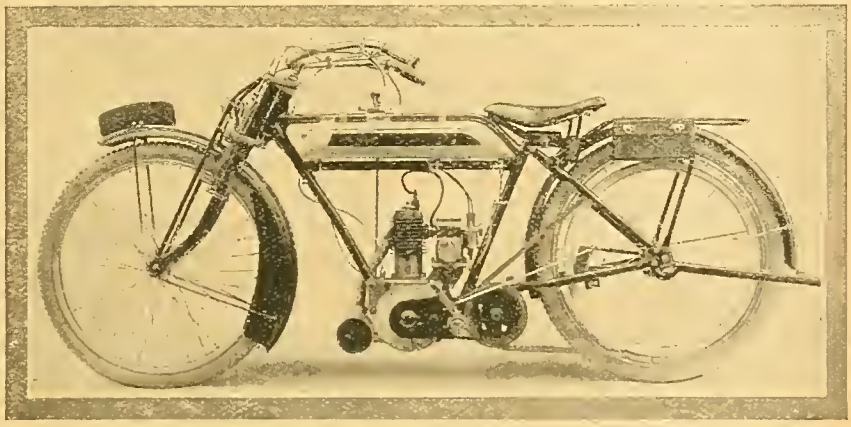
MR. A. H. HADEN, of Princip St., Birmingham, was one of the first of our manufacturers to realise the possibilities of Overseas trade in motor cycles and parts. He has, in consequence, reaped the benefit of his enterprise, and it is hardly surprising to find that the greater part of his business is done out of England. New Comet models range from two to eight horse power, and include two and four-stroke engines and special ladies' models.

Among the lightweight machines there is a wide choice. A very compact motor cycle is turned out, fitted with either the Precision Junior unit or a 211 c.c. two-stroke with a two-speed countershaft gear and chain and belt drive. In each case the frame is very strong without being heavy, and the fittings throughout are stout and of sensible proportions. Druid forks, 26in. wheels, and comfortable foot plates are included in the specification. Care has been taken to ensure the most comfortable riding position, and it is particularly noticeable that even the lightest models are fitted with a double top tube. Both lightweights can be obtained with open frame suitable for lady riders, in which case both the top tubes are dropped sharply downwards, and meet in a common lug part way up the saddle tube. This gives plenty of dress room, and still leaves a frame of ample strength. The open frame models are, of course, fitted with a belt shield, to prevent damage to the rider's dress.

To pass on to one size larger, we find a serviceable mount equipped with a 350 c.c. two-stroke engine and a three-speed hub gear. This is a robust machine, capable of solo work in any country. With its 26 × 2¼ tyres, strong stand and carrier, comfortable saddle and wide guards, it forms a serious touring mount which is at the same time not so heavy as to be unwieldy, weighing as it does approximately 150 lb. Here, as in other models, we find details carefully carried out, and the foot brake is arranged so that a fall is not in the least likely to put it out of action. This model may be obtained with pedalling gear and foot-rests in place of footboards.

Among the long list of remaining models to suit all tastes the big twin may be taken as a worthy representative. It is designed to suit the 6-8 h.p. J.A.P. or Precision engines, and is built throughout to withstand the heavy strains of sidecar work on bad roads. The mudguarding and fittings are of the first order, and the complete machine strikes a high note in motor cycle construction.

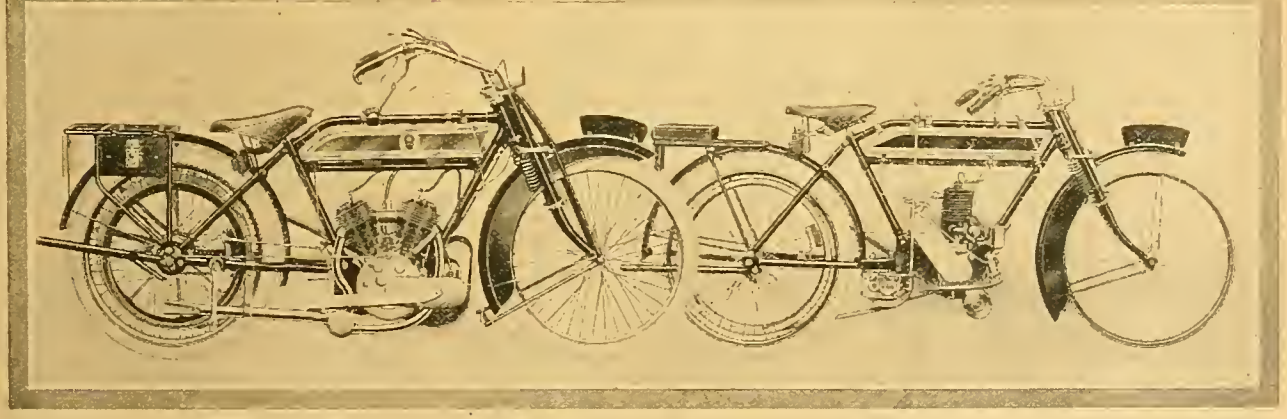
An equally wide range of sidecar chassis is manufactured at the works, and extends from the light touring machine to the very heavy types suitable for heavy loads in bad country and commercial work. The quick detachable sidecar clip is a point worthy of attention on all models.



The new Dot lightweight, particulars of which appear on this page.

A DOT LIGHTWEIGHT.

Mr. Harry Reed, of Manchester, maker of the Dot motor cycle, has long been known for his powerful machines. Of interest, therefore, is the new Dot lightweight machine, which is fitted with a 2½ h.p. J.A.P. engine 70 × 76 mm. bore and stroke (292 c.c.). A Dixie magneto is mounted on a platform behind the cylinder; in rear of this again is an Amac carburetter. The transmission is by a chain to the Albion two-speed gear situated in the countershaft, and thence by belt over a large pulley to the rear wheel. Saxon forks and a Brooks saddle combine to make the machine comfortable. The front mudguard is provided with side flaps. Hutchinson tyres are standard, and the general lines of the machine are neat and effective.



Extremes of the New Comet 1915 range, the big twin-cylinder and the light two-stroke. Both models are built "with an eye" for Overseas trade.

Sturmey-Archer Three-speed Countershaft Gear.

WE have several times mentioned the new Sturmey-Archer gear, which is adopted by many leading makers as standard for 1915, and its many excellences. We now propose to give a complete description of the gear and its method of operation.

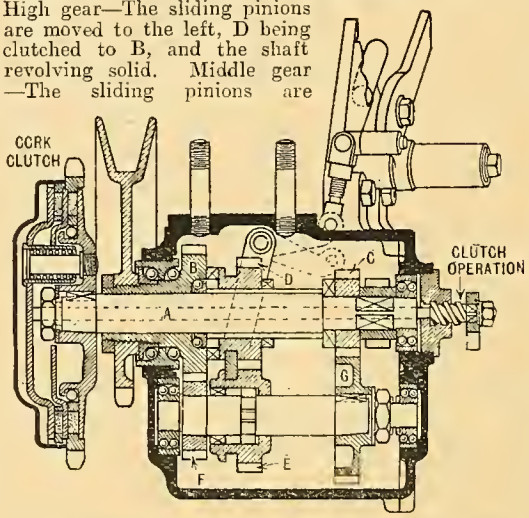
In the first place, it should be noted that the gears are all continually in mesh for the full width of the teeth, and consequently there is no danger of the edges of the teeth being chipped, to the detriment of the entire gear.

The Clutch.

The clutch consists of a main body, keyed to the main gear box axle and four other friction plates. Two of these are prevented from revolving by the spring boxes, of which there are six, one being shown in the drawing; the other two plates, carrying a series of corks, are coupled together by tongues on their peripheries, and one of them carries the driven sprocket. The only parts liable to wear are the cork inserts, which are easily renewable. The outer dust cap is sprung over an extension of the sprocket. The clutch is disengaged by a rod running through the main axle, and operated from the handle-bar through the quick pitch screw shown on the right. It is very smooth in action.

The Gear Box.

The main axle A, to which the clutch is keyed, carries gear wheels B and C, one at each end, both free to revolve upon it. That on the left, B, has an extension, on which a driving sprocket or pulley is mounted. The centre part of the shaft is fluted, and upon this slides the third gear wheel D, provided with dogs at each side. The layshaft has a gear wheel keyed to each end, and is formed with dog clutches in the centre, which engage with a corresponding set on the sliding pinion E. The pinions on each shaft are operated by the same lever, and slide together. The action is as follows: High gear—The sliding pinions are moved to the left, D being clutched to B, and the shaft revolving solid. Middle gear—The sliding pinions are moved to the central position, and the drive is through D, E (now clutched to the layshaft), F, and B. Low gear—The sliding pinions are moved to the right, D being now clutched to C, and the drive is through C, G, F, and B.



Diagrammatical section of the new Sturmey-Archer three-speed countershaft gear, having all the gears constantly fully in mesh, and cork insert clutch. The letters are referred to in the text.

The gear ratios are 1, 1.632, and 2.662, and the following gears are therefore available: 3, 4.9, 8; 3½, 5.7, 9.3; 4, 6.5, 10.7; 4½, 7.34, 12; 5, 8.15, 13.3, and so on in similar proportion.

Kick Starter Mechanism.

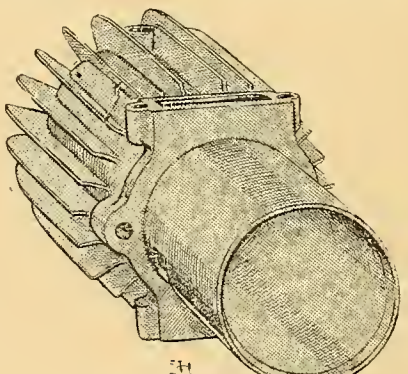
The kick starter is so arranged that, when the spring brings the lever to the normal vertical position, a projection on the free-wheel pawl comes into engagement with a fixed cam which depresses the pawl out of action, thus making for quiet running and absence of wear. When starting the engine by means of the kick starter, the gear lever should be placed in the neutral position with the clutch in engagement. When the engine starts, the clutch is withdrawn before the low gear is engaged, after which the clutch is re-engaged, and the gears changed as required. When changing gear, it is not necessary to declutch, but the exhaust lifter should be used momentarily. It is recommended that the gear should be lubricated with engine oil, a large accessible hole being provided for this purpose.

A New Twin Connaught.

AS regards two-stroke motor cycle engines, the new horizontally opposed twin Connaught marks a new epoch. So far some difficulty has been experienced in constructing air-cooled two-stroke engines having a cylinder capacity exceeding very moderate limits, but there would appear to be no reason why this limit should not be approximately doubled by employing a twin. In the case of the Connaught this has not yet been done, as the new engine has a bore and stroke of 60 × 60 mm., but it must be realised that, although the crankshaft impulses occur at the same intervals as would be the case in a horizontal twin four-stroke, yet both cylinders fire simultaneously, and, therefore, double the number of explosions take place. Thus, the balance is as good as possible with a twin engine, and the torque is as good as with a four-stroke horizontal twin.

The cranks are set at 180°, and carefully balanced, the shaft running on ball bearings with plain compression retainers. Both cylinders project a long way into the aluminium crank case, the inlet port being formed in the casing of the rear cylinder.

Both cylinders and crank case are bolted firmly to a stout aluminium casting which forms a combined bedplate and silencer, and is rigidly attached to the frame at both ends. This bedplate bolts directly to the exhaust ports, and thus no exhaust pipes are employed. The lid of the crank case, which also acts as a magneto platform, is formed by part of the transfer pipe casting which lies along the top of the engine. This transfer pipe includes a very unusual device, consisting of a rotary throttle sleeve in the rear cylinder lead. The object of this is curious. All two-stroke riders know that when running light, either downhill or with the clutch out, their engines develop a tendency to four-stroke, and it has been found that by cutting out the rear cylinder on the Connaught by means of the before-mentioned throttle the full charge passes to the front cylinder, which continues two-stroking regularly, giving the same number of impulses as though both cylinders were in action.



The back cylinder of the new twin Connaught. On top is the transfer port, and directly below lies the exhaust port, while, below the flange, the corner of the inlet port can be seen.

The magneto problem for an engine of this type requires some consideration, as two sparks have to be generated simultaneously, but in the engine we inspected the trouble had been overcome by a special U.H.

Lubrication is by petroil, and the frame and fittings, with the exception of the special engine fixings, are on standard Connaught lines. Photographs of the new engine appear on the opposite page.

A TWO-SEATED SIDECAR.

For some time past Messrs. A. J. Stevens and Co., Ltd., have been testing a two-seated sociable sidecar. This new model has given great satisfaction, but it is not yet known whether it will be placed on the market for 1915, as the company is experiencing so great a demand for the standard models.

Clubs and Affiliation in War Time.

Reply to our Leaderette from the A.C.U. Secretary.

To the Editor of "The Motor Cycle."

I CANNOT help feeling that, unintentionally, you have struck a wrong and almost unpatriotic note. The services that motor cyclists in general, and the motor cycling clubs and their parent society in particular, have been able to render the country in this time of war, have been not inconsiderable, and, I suggest, should be an added reason why individuals should continue to support their clubs and the clubs to rally round the Union.

Instead of drawing attention to the fact that a good many motor cyclists who are not serving their country are economising by resigning from their club, you should have exhorted them to "carry on" as usual and individually to do their best to obtain new members, so that their club funds may the better be able to carry those of its members who are away serving their country as honorary members in every sense. Those you refer to who are neither serving their country nor supporting their clubs cannot surely be many; as honorary secretary of, I think, the second largest motor cycling club in the Union, I have not received one single resignation since August 1st.

One gathers from your article that matters motor cycling are dormant, and that as there is nothing for clubs or the Union to do we should all sit with folded hands and keep them away from our pockets until brighter days dawn. Such pessimism is unwarranted, harmful to the industry, and unfair to the "great federation of clubs so carefully and laboriously built up."

As a matter of fact, not a day has passed since the commencement of war without several new members joining the Union, whilst during the same period clubs have notified me of 646 new club members. The number of applications for particulars of tours and for free legal defence has been actually greater than during the corresponding period of last year. Are not your circulation figures equally encouraging? [They are.—Ed.] What of the refreshing leaderette on the state of the industry that follows the article in question?

Even admitting, however, that there may be a drop in club membership this year, is this a good reason why clubs should reduce the amount of their membership subscriptions? Clubs are not run for profit, and, as a general rule, the subscriptions are merely sufficient to pay for stationery, printing, and postage, together with the capitation fee of 6d. or 5s., as the case may be, to the Union. There is still less reason why the comparatively small fee paid by the clubs to the Union should be reduced. The fewer the number of members to be benefited the more expensive the provision of such benefits becomes, whilst such heavy charges as rent of offices and other administrative expenses have to be paid as in normal times. As to the latter, it may be of interest to state that more than one half of the clerical staff of the Union have enlisted, and that the Union is, in each case, making up their pay to their original salary figure.

To remove any misapprehension, it should be clearly understood that the Union has never had any wish unfairly to tax its clubs, or to draw one penny from them more than they can afford. The Union does not, any more than the clubs, exist for profit, but, unlike its clubs, it has necessarily to spend many hundreds of pounds a year to maintain its position as a parent society, an expenditure that this year will probably show a balance on the wrong side.

In their own interests club secretaries should be careful to exclude from their list of members all those who do not punctually pay their subscriptions; there is no liability on a club to pay a capitation fee in respect of other than its paid up members, and it is quite optional for the club to decide whether this shall be on the sixpenny or the five shilling basis.

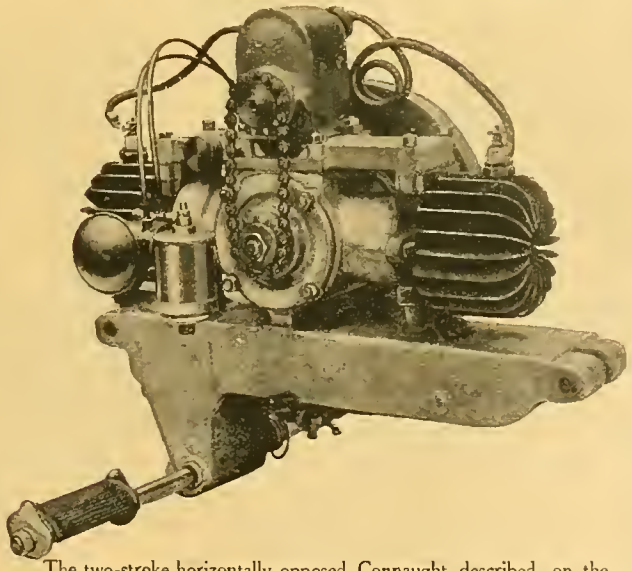
I feel sure that my committee will willingly waive all claim to any fees in respect of those honorary club members now serving their country; to go further than this would be merely suicidal, and would, in your own words, so destroy or weaken our "great federation" that "recovery would indeed be difficult if not impossible."

In conclusion, sir, may I add that we should each and all of us do our very best to encourage during 1915 the sport and pastime of motor cycling, the branch of automobilism that to an even greater extent than mechanical flight has proved itself an unexpected national asset, unexpected, that is, save to those few who have had the privilege of guiding the movement during the last ten years! This is no occasion for our leading motor cycle journal to pitch its opinions in a minor key, rather should we all rejoice that the British motor cycle has found its place in the sun, and determine to maintain it there.

T. W. LOUGHBOROUGH,
Secretary, Auto Cycle Union.

A Concession Outlined.

[As to the suggestion that we have taken a pessimistic attitude, we have only to point out that "Carry on" has been the title of a leading article and our motto of encouragement from August and onwards. There is no getting away from the fact that competitions are dormant; indeed, they are discouraged by the A.C.U., and this body must know that competitions are the life and soul of the average club. Our correspondent's denial of the facts seems to suggest that he is at the moment out of touch with the conditions obtaining in club circles. However, criticism is largely disarmed by Mr. Loughborough's outline of a workable scheme of give and take between the parent society and its affiliated clubs. That such a scheme should be evolved was the main plea of our article.—Ed.]



The two-stroke horizontally-opposed Connaught described on the preceding page. Note how the aluminium silencer forms a bed plate for the engine.

A PREMIER SIDECAR MACHINE GUN.

THE PREMIER CO., LTD., have given their attention to the production of a sidecar machine for gun carrying. We have already announced that the Motor Machine Gun Service is to become a permanent section of the army, and every division of the army in the present war will gradually have a motor machine gun service attached to it. Hitherto, the sidecar machine guns which have been utilised for service have been pleasure type vehicles adapted for the conveyance of a light machine gun, but the Premier product is specially designed throughout for the work in view. It is immensely strong, as will be gathered when we state that the sidecar chassis tubes are 1½in. diameter and of 10 gauge. Mounted upon the ordinary chassis is a subplatform supported on large diameter coil springs, a metal tray extending its whole width. A most novel feature of the Premier war implement is the snap security for the legs of the tripod on which the machine gun is mounted. By depressing a clutch pedal the claws securing the feet are released, and the gun complete with its tripod can be removed quicker than it takes to tell. An arrangement fitted by the Premier Co. to the gun which we have not seen before, but which struck us as being immensely practical, consists of a tray to support the ammunition belt. This tray swivels together with its ammunition as the gun is moved, which simplifies the rapid feed of the gun.

FINAL TOUCHES TO THE DESPATCH RIDER

ONE day last week it was our privilege to follow some interesting manœuvres, in the country south of London, in which about one hundred and twenty motor cyclists were engaged. The riders were supposed to be attached to headquarters which were situated at The Hnt Hotel, Wisley, to two divisions, one of which was at Church Cobham and the other at Ottershaw, and to four brigades, two belonging to each division. Of these, the first and second brigades were at Stoke D'Abernon and Esher respectively, and the third and fourth brigades at Weybridge and Staines. There were also motor cyclists supposed to be attached to cavalry belonging to the various brigades. This force was working against six men, each representing thirty thousand. The enemy wore white sweaters over their macintoshes and white bands round their caps.

Most of the participants slept in a barn at Esher, in which, as they learned the next morning, a poor man had hanged himself some twelve months previonsly. Many of them were grateful that this interesting piece of news had not been conveyed to them the night before.

The start was made at 7.45 a.m. We attached ourselves to the e[n]
Lieutenant Busby [w]
to Leatherhead. I[n]

n Division, of which harge, which retreated s position there for a drew to East Clandon. n officers who were s in a private hospital the men and their resting to see the way r suddenly to discover then turned round at a side turning into rticularly fine lot, and th great skill. The latter were Rudges, B.S.A.'s, Triumphs, and Douglases.

The weather was inclined at first to be misty and cold, but later on it cleared up, and the day was fine and the roads good on the whole.

Forty-two Despatch Riders Captured!

The duty of the enemy was to try and intercept messages passing between the various bodies, and that they succeeded is borne out by the fact that they captured no fewer than forty-two despatch riders. In the case of a despatch rider being captured, his message was marked to show that he had been taken, and he was sent off again to try and find some other road over which he could deliver his despatch without being caught again.

The main purpose of the test was to give the finishing touches in instruction to a number of trained men in a thorough understanding of map reading and the art of keeping away from main roads.

The proceedings were prematurely terminated by a despatch handed in at Guildford to the effect that everyone was to return to barracks and report himself. This unexpected official summons to headquarters was answered with great promptitude.

Seasonable Contributions.

This issue contains articles of seasonable and topical interest. These consist of "A Lighter Spirit" (page 696), "Why I Dislike Sidecars," by Colney Hatch (page 711), and "A Message in Morse" (page 698).

The Edwards Cup.

In the Edwards Cup reliability trial, organised by the Leicester and District M.C.C., and referred to in our last issue, H. J. Woodgate's time was given to us as 3m. 13s. This should have been 2m. 13s. This club has now transferred its headquarters to the George Hotel, Haymarket, Leicester.

Rubber Supplies.

Somebody, with an obvious axe to grind, is circularising motorists to the effect that a rise in the price of plantation rubber will shortly necessitate a corresponding increase in the price of tyres. We have the highest authority for declaring that both these statements are devoid of fact. Indeed, it is pertinent to point out that rubber having been declared contraband of war and its export prohibited, supplies in this country should be plentiful. There is therefore no necessity for the motorist to depart from his normal practice of buying tyres as and when he wants them.

Stolen Machine.

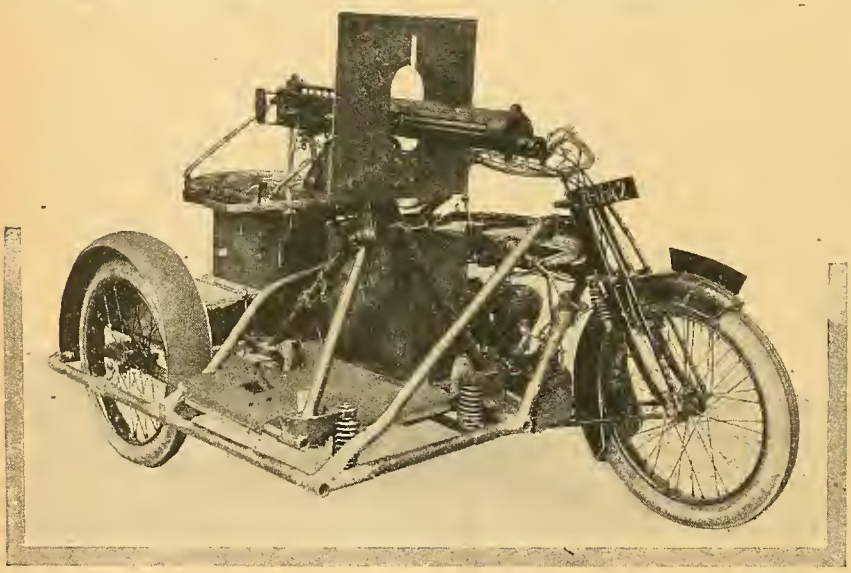
A 1914 4½ h.p. James was stolen from Churchers College, Petersfield, Hants, last week. Engine No. 3,817, frame No. 51215. The owner, A. H. G. Hoggarth, would be glad of news of his machine.

Bristol New Year Trial.

We hear that the Land's End trial is likely to prove a great success. Entries, which must be sent to Mr. F. C. Wasley, 9, Victoria Street, Bristol, close on the 26th inst. A gold medal will be awarded to every rider who complies with the regulations and is not more than five minutes early or late at any timed check. Similarly, silver and bronze medals will be presented to those within fifteen and forty-five minutes respectively.

Trials and the War.

Anent the forthcoming Bristol trial, to be held on January 1st and 2nd, Mr. F. C. Wasley, the trials secretary, writes as follows: "We fully realise the seriousness of this most deplorable war, and, as a club, are doing all we can to help, and have already contributed over £50 to different war funds. We do not, however, see that any useful purpose is being served by abandoning all trials. This view was shared by several competitors in our last trial, who expressed their opinion that the trade would welcome a winter trial to give them an opportunity of showing the paces of their 1915 machines. We have greatly appreciated the help we have received from manufacturers in the past, and feel that it is the duty of clubs to utilise their best efforts to stimulate the trade during the present crisis."



The Premier machine gun sidecar. Notice should be taken of the pedal on the platform, pressure on which immediately releases the tripod from the three locking sockets. (See page 707.)

SPECIAL FEATURES

THE LIGHTER SIDE OF MOTOR CYCLING.

FINISHING TOUCHES TO THE DESPATCH RIDER.

An Interesting Test.

A.C.U. Affiliation Concession.

Our leaderette urging for special consideration of the affiliation question in war time on the part of the A.C.U. has drawn a reply from the secretary of that body, who outlines a concession in respect of club members serving their country.

Warm Clothing for Despatch Riders.

That the motor cyclist despatch rider in common with every branch of the Expeditionary Force, is being well looked after is confirmed, if such confirmation were necessary, by the letter from D. H. Noble published in this issue. He says that they have good food, and they have just received short leather coats. The lorry drivers, among whom are many well-known motor cycle riders, have received long fur-lined coats.

The Sidecar Machine Gun Batteries.

Fifty-one further applications have been received by the Editor of this journal for service in the Sidecar Motor Machine Gun Batteries, and several have been inspected and accepted for service. All the applications are receiving the consideration of the authorities.

Many men ask for transfers from other regiments to the Motor Machine Gun Batteries; this is, in most cases, impossible, as it interferes with training.

The Dardanelles Hero.

The following story of Lieutenant Commander N. Holbrook is told by Fred T. Jane in *The Evening Standard*:

"The last time I met Lieutenant Holbrook was under conditions which in their own way were almost as exciting as the torpedoing of the *Messudieh* must have been. He and my brother-in-law (who is also on a submarine) had elected one night to tune up a 9 h.p. motor bike which had jibbed; and for comfort they decided to do so in a basement room. They removed the controls—both switch and throttle being under suspicion. Unexpectedly the engine started. When I came on the scene in response to cries of 'help,' one of them was on the machine struggling to find a brake in the midst of infernal smoke. The other was hanging on behind to the carrier, waltzing about full length on the floor. A 9 h.p. motor bike trying to jump off her stand under full power is no mean thing to combat, especially with a wall some ten feet ahead, and those in supposed control nearly asphyxiated!

"Somehow, we short-circuited it with a screwdriver just as the bike had started to leap to the wall. I think we corrected her in mid-air. Anyway, there was an almighty tumble, with Holbrook underneath, and I scale about fourteen stone! The quaintest thing about this war is that men who have had 'silly episodes' are always the ones who have come up."

FOURTH EDITION

Revised, Enlarged, and brought up to date.

"Hints and Tips for Motor Cyclists" contains what may be termed the cream of all motor cycling knowledge up to date. The book gives hundreds of useful "wrinkles" and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine. The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page. Invaluable to the new rider.

MACHINES AT REDUCED PRICES OFFERING UNUSUAL VALUES

HERE, Sir, is an opportunity to economise, and at the same time secure a fresh mount for next season. We are offering the remainder of our 1914 stock of machines at specially reduced prices. Four of the bargains are quoted below, any of which may be purchased on Selfridge's Deferred Payment Plan. Why not call and inspect these machines when next you are our way?

Calthorpe Junior, 2 h.p., 2-speed gear; very slightly shop-soiled. In excellent condition, never been on the road. Reduced to **£24**

Chater Lea Combination, 8 h.p. Complete with coach-built sidecar, hood, screen, lamp, generator, and horn; shop-soiled, **£90**

Excelsior Combination, 5-6 h.p. Complete with coach-built sidecar, lamp, generator, and horn; shop-soiled **£70**

Indian, 7 h.p. Hendee Special, 1914. 2-speed, electric starter, lighting equipment, and horn; very little used **£65**

ACCESSORIES FOR PRESENTS

Handle-bar MUFFS in Black Waterproof, lined Tweed, a pair 9/6; lined Tamo, 15/6; in Tan Leather, lined Fur, 27/-.

30-hour Motor Cycle WATCH, guaranteed movement. Reliable and accurate timekeeper, 9/6.

Billiken Motor Cycle MASCOT, in brass or nickel. Each 5/6.

Carrier CUSHION for motor cycle. In Black Japanned Leather, filled doe hair and fitted with four straps. Each 4/6.

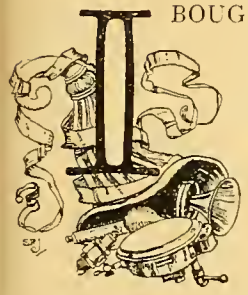
WHY I DON'T LIKE SIDECARS.

Being the Irresponsible Musings of Colney Hatch, Esq., with Some Sage Advice to Motor Cyclists who are in Love.



I BOUGHT my first sidecar in the year 1903 or thereabouts. I bought it as the direct result of a blighted love affair. She was a peach; I have loved many others since, but she was absolutely It, and even my latest 8 h.p. [No gratuitous ads., please! — ED.] has not banished her image from my heart. Her parents were wealthy—and fastidious. I was poor, and a motor cyclist. The course of true love did not run smooth—for my 4 h.p. twin Werner seldom fired on both cylinders. However, I won her and took her out in my trailer. She longed to do a mile a minute, and the Werner would only touch 43 m.p.h. on the flat. So I let it all out down Dashwood, and the trailer rod broke. When she recovered consciousness, she shared her parents' attitude towards me. I got another girl and bought a sidecar.

The Duplex Steering Type.

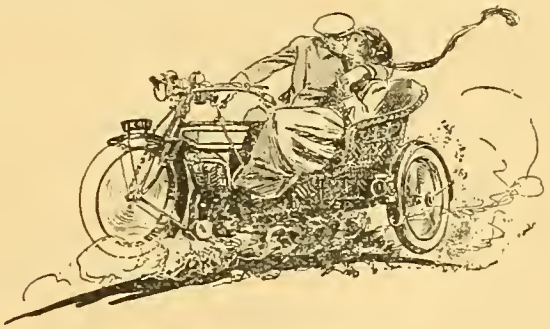
My new discovery was the daughter of a minister, and the sidecar had duplex steering and was fitted to the left-hand side of my Werner, from which I was accustomed to mount. Her papa's manse had a large circular geranium bed in the centre of the drive. I pushed the Werner off till it fired on one cylinder, and I ran round the geranium bed, hopping timidly along the offside of the sidecar outfit, and wondering how on earth I was to mount. Charity began to scream faintly; her mamma was dancing with

"I left the house under a cloud——"

apprehension on the top step of the manse, and papa—so far as I could see—was hardly praying. Three times we encircled that geranium bed, and still my coward heart shirked the leap aboard from the offside; my right leg dare not quit mother earth, and my left leg scarcely felt as if belonged to me at all. At last—on the fourth lap—I began to feel very bored with the geraniums, and at last I did a sort of half hop. My left boot caught Charity on the ear, my right shin caught the sharp end of the offside pedal, and I said—what any unregenerate man would naturally ejaculate in an unguarded moment, before he had got used to the restraining idea of a minister as a prospective pa-in-law. I left the house under a cloud, I may say under two clouds, one consisting of the parental wrath, and the other of half-combusted lubricant, for the automatic valve of the pump had struck work, and the crank case was clucking audibly with about a quart and a half of oil in it.

The Flexible Pattern.

For a time I eschewed girls, and spent the summer trying to perfect the adjusting of the steering arm, which ran from the sidecar wheel to the front hub. I failed in this task, and simultaneously alienated all my male friends, eight of whom I bushed in hawthorn



"I made full use of the opportunities."

hedges at blind corners, owing to that steering arm jamming relentlessly on full lock at speed. The next summer dawned; it was obvious I must get a new girl and a new sidecar or drive alone. I got a new girl—I am an expert at that; and a trade friend coaxed me to buy a new "flexible" sidecar. I was very pleased with the new sidecar in my preliminary spins. With the outfit at rest it leant against the bicycle with a sort of "Don't mind me!" expression, and when I got on the road with the chair empty, it did not affect the steering in the slightest; I steered just as if I were on a solo bicycle, and only realised the presence of the sidecar when I took a left-hand corner, on which occasions the flexible sidecar would caress my leg lovingly. I soon gathered sufficient confidence to offer Esmeralda a run. Esmeralda was of the plump species, and we had no sooner got off than I found that her weight caused the flexible sidecar to assume a permanent lean towards me. As Esmeralda was inexperienced in affairs of the heart, and had proved quite absurdly coy, this came in handy, and I made full use of the opportunities—till the first left-hand corner, when that infernal sidecar fairly jammed my leg against the bicycle and cause me acute agony. Rounding the corner, it released its vice-like grip of my thigh, and I inwardly determined to engineer a hasty breach with Esmeralda, and to find a new girl,

Why I Don't Like Sidecars.—

preferably about six stone. How trouble clouds men's minds—it never occurred to me to keep Esmeralda and get a rigid sidecar.

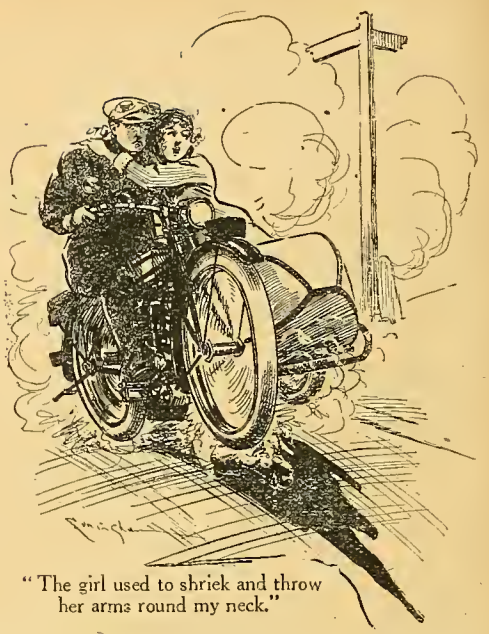
Tyres and Security Bolts.

However, fate arranged affairs for me. Owing to the flexible sidecar flexing itself out of track, the back tyre burst; we stopped and bought another, and, by the dealer's advice, inserted four security bolts. At the next right-angle corner, the back cover came off. I mended the tube, being much puzzled by the security bolts, to which I was unaccustomed, and, as I got them back wrong, they tore four splendid rips in the tube in the next mile. I bought a new tube, put them in wrong again, and bought another tube. Esmeralda was getting distinctly ratty (Mem.—Excellent thing to see how a girl takes roadside trouble; apply this test

"Exit Esmeralda."

to all future applicants for a vacancy as Mrs. Hatch). Finally we arrived at the country bower where I had promised Esmeralda tea with strawberries and cream. My wages were only 35s. a week at this date. The series of tyre troubles had emptied my purse, so Esmeralda had to pay for my tea and her own too; she did not speak to me all the way home, and I did not trouble to ask her for another appointment. I sold the sidecar next week to my tailor, who had county-courted me the year before for the suit in which I won Charity's heart; and his tyre bill for that summer must have been about £14; so all's well that ends well.

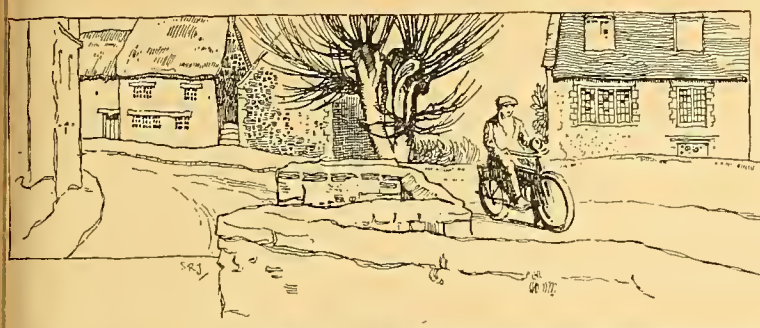
Next time I got a rigid sidecar which frightened me to death. By this time I had got the six stone girl—I won't mention her name, as she landed me for breach of promise, and it's a sore subject. I explained to the judge that the sidecar was the root cause of my heartless behaviour, and that I would marry her next week if she'd take a course of Virol or something and get her weight up to ten stone; but, not being a sidecarist, he was adamant, and awarded her £50; even this I took as a personal insult, for I am worth more than that to any girl—why, my 8 h.p. cost £75, and is worth—[*No* free ads.—ED.] It was on this wise. Whenever we took a corner at all fast, the sidecar used to rise gracefully off the earth and tickle my left ear. The girl used to shriek and fling her arms round my neck, instead of leaning out hard in the opposite direction. I told her till I was tired that there is a time to embrace, and a time to refrain from embracing, and that the author of the maxim had right-hand right-



"The girl used to shriek and throw her arms round my neck."

angled corners with a sidecar specially in his mind; but she was too timid for the game, and we had to part. Her successor was a buxom widow of 11st. 9 lb. and held the sidecar well down without any leaning out; she has means, and we propose to buy a cycle-car for the honeymoon, with which I anticipate my troubles on corners at any rate will end.

This column, which stands near Norman Cross on the Great North Road, was recently erected to the memory of 1,777 soldiers and sailors, natives or allies of France, taken prisoners of war during the Republican and Napoleonic War with Great Britain, 1793-1814, who died in the military depot at Norman Cross, which formerly stood near to this spot, 1797-1814.



LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Chain Cases.

Sir,—On reading "Occasional Comments" by "Ixion," I find he refers to chain cases on motor cycles as being rather a failure. As an owner of a 1914 A.J.S. combination, I must say that I have yet to come across the faults he finds with average chain cases. There is no rattle, I do not require a sledge hammer, etc., to take down the cases, and also they are no great trouble to re-fit, and I must say the little trouble is repaid by the extra life of chains. I also do not think "Ixion" will find that A.J.S. engines give the vibration he mentions in the chain stays. Possibly they have better balance than most.

W. H. BROWNING.

Dogs and Motor Cyclists.

Sir,—A certain rider of an F.N. combination in Manchester uses a big black dog as a weight in his sidecar. The faithful creature clears the road in his own native canine fashion, accompanied now and again by the hooter. When the master leaves the outfit on the road, he keeps a guard from his perch in the sidecar, and strangers and children dare not come near the machine.

Many motorists have got dogs at home. Why, then, do they not train their pets for such useful purposes? A run or two in an empty sidecar will be quite sufficient to get these intelligent creatures used to their new work. I.H.

Powerful Solo Machines.

Sir,—I have studied your Buyers' Guide with great interest, and it appears to me that every class of rider is well catered for excepting one, namely, the big twin soloist. I have lately ridden a 6 h.p. Matchless with hub three-speed gear and 1⅝in. belt over 5,000 miles solo, and it has given me the greatest satisfaction in every way, excepting that it weighs, when ready for the road, about 305 lb., which I consider unnecessarily heavy. With regard to this question of weight, a few years back a well-known firm of cycle makers used to produce a machine weighing 24½ lb., guaranteed to carry 17 stone. Now this machine had to withstand very severe strains when running fast, say twenty miles an hour downhill, and coming in contact with a loose stone; and surely if such a machine could be built, in view of the fact that a 5 h.p. twin engine only weighs 60 lb. or less, a 5 h.p. solo machine could be built which would weigh less than 200 lb. when ready for the road.

Personally, I must say I prefer the hub three-speed gear for solo work, because I think it is lighter, and I consider a machine looks smarter without a countershaft gear, though I know this is a matter of opinion. I also prefer the simplicity of the belt only for transmission.

I prefer the big twin, because it enables me to glide up hills in a manner impossible on a low-powered machine, and every motorist knows the value of power, especially in a hilly country. I do not consider it much more expensive to run, for, although it may cost more in petrol, oil, and tyres, I think it costs less in engine repairs—an expensive item. I have just taken the cylinders off my 6 h.p. J.A.P. engine, and can find no trace of wear after 5,400 miles solo work, whereas I have known 2¾ h.p. engines that required the big ends taking up after less than 3,000 miles. Obviously, a 6 h.p. engine, if only called upon to do the same work as a 3 h.p., will last pretty well twice as long.

F. R. L. CHALK.

Belt Fasteners.

Sir,—My present machine is a 1910 Douglas, which I have been riding since the beginning of that year, and I was interested to read "Ixion's" recent remarks about belt fasteners, for I had a lot of trouble with mine. I used to buy the Stanley ⅝in. size and grind it down on either side as narrow as the pin would allow; but even then the ⅝in. belt would soon stretch and wear narrower than the fastener, and I had to scrap several good belts simply because I could not get a fastener narrow enough to use.

Suddenly I had an idea of how to make a very narrow fastener, but I did not think it would work, and was delighted when I found it would. I have used it now for nearly three years, doing over 10,000 miles; it seems unbreakable, and shows very little signs of wear. It has enabled me to use up all the old belts, and I carry a number of hooks of various lengths to slip in for quick adjustment.

FRED HALL.

A Mute Appeal.

Sir,—As one of those (whom "Ixion" so gracefully refers to as) "mute people who never write to the papers, but who are nevertheless" (I blush as I include myself amongst them!) "the base and backbone of the industry," may I, for once, emerge from my shell to make a few suggestions to those good people, the motor cycle manufacturers, in the hope that you, sir, and "Ixion," may give a little prominence to these suggestions (especially the last), and press them home.

1. CARBONISATION.—"Ixion's" complaint is, indeed, a just one. But give us a detachable cylinder head, as one of the Transatlantic firms have already done, and the job of scraping off deposit becomes an easy one.

2. CONTROL PEDALS (BRAKE AND CLUTCH).—Fix these so that they are ready to the toe without having to lift one's foot off the footrests.

3. LIGHTING AND IGNITION.—Is it impossible to combine these in one "dynamo-magneto," and who will be the first firm to do it?

4. SILENCE.—When, oh when, shall we have a really efficient silencer instead of the tin-canister-sounding-box now supplied as standard with nearly all our machines? Why should a 4 h.p. motor cycle be so much more noisy at ordinary speeds than a 20 h.p. car? They say it is a question of power—that "silence means loss of power." Is this necessarily so at ordinary speeds?

Would it not be possible to silence the exhaust almost totally, and valves, too, for normal output, and provide a cut-out to give, not an open, but a more open exhaust when the need for extra power demands that the back pressure be relieved.

I cannot think that this ideal is impossible of attainment, and I believe we should have had it embodied in the ordinary touring mount long ago, if only the thousand or so professional men like myself—to whom the fussy noisiness of the motor cycle is now its chief drawback—had pressed for a silent machine.

Power and noise! Are they so inseparable? Certainly not in the human mind, for power never seems so powerful as when silent: nor yet in Nature, for what more glorious sight than a seagull strongly breasting a 60-knot gale with never a flutter or a squawk! (Rev.) AUSTIN LESTER.

The Bristol-Land's End Trial.

Sir,—I note with joy that the Bristol Motor Cycle Club intends to hold a twenty-four hours trial on January 1st and 2nd.

There are many competition riders, who, for various and excellent reasons, are debarred at the present moment from assisting their country at the Front, who will, undoubtedly, hail with glee the fact that there is at least one club left which is not numbered amongst the pessimists.

Competitions are, undoubtedly, necessary to the trade, when a medal is not dependent on the excellence of the rider's watch, but on the reliability of the machine. Again, such runs as this help to keep men fit for active service should they be called upon. I sincerely hope that both the trade and private owners will join together to make the trial a success, more especially as, in my opinion, the B.M.C.C. trials are really sporting and the members sportsmen CHAS. H. R. NORRINGTON.

Why an Engine Konks.

Sir,—Will you allow me to confirm Mr. A. W. Tutt's experience detailed in your issue of December 17th? I also had, some years ago, a single-cylinder motor cycle with overhead valves arranged in the area of the combustion head. It was not only the worst engine to konk, on the least provocation, that I ever possessed, but at night the whole of the exhaust valve cage and the first few inches of the exhaust pipe always glowed red hot, despite thorough lubrication and good carburation. Timing was not late, and the ignition was by battery and coil (non-trembler) and make and break contact. The carburetter was at first a surface type; this was afterwards changed to spray, but the konking still continued. Despite every attention on the part of the makers, I was forced finally to part with the machine, and never traced the reason why it was such a culprit. It was supposed by the makers, but never confirmed, that the piston was too good a fit and compression too high, as their next batch of engines was turned out with looser pistons and reduced compression. I did not own one of the later batch, but saw plenty on the road. To the best of my knowledge, the makers never really knew what made that engine konk but konk it would, and to a standstill on level ground. The gear ratio was 4¾ to 1. G.F.W.

Sir,—I have a theory about the cause of engine konking; if it is a false one I would like to get rid of it. I quite agree with what most of your contributors have to say on the subject, but to me there seems to be a more common cause for so common a complaint. My theory is this: Engine konking will not occur provided you can keep the flywheels of your engine revolving fast enough to put the piston over compression easily, and no tendency for backlash to come into play, or for moving cycle to help flywheels to drive piston over compression. When this latter occurs it is very evident, immediately the crank pin passes dead centre and with explosion pressure on top of piston, the engine will bound forward until it meets with the resistance offered by the slower going cycle. This, to me, seems to be the konking point. Certainly a slack piston or slack bearings, spark advanced too far, pre-ignition, and detonation greatly increase any konk.

As proof for or against my theory, maybe someone who has had experience of brake-horse-power tests, with brake pulley direct coupled to engine-shaft, will tell me if an engine is more difficult to make konk in such a case than in ordinary everyday use, as there can be no question of backlash. It would also be very interesting to know what must be the number of revs. per minute of a few of the best known engines to overcome full compression.

BACKLASH.

A Silent Machine.

Sir,—I wish you would try to persuade the manufacturers of motor bicycles to make them a bit more silent. I very nearly missed getting one at all just because of this. You see, I am blessed with several aunts, and when the governor wanted to give me my lightweight, my aunts had a regular meeting, and nearly bullied my mother into forbidding it. Their chief objection seemed to be the *vibration*, which, they said, would be awfully bad for me, but fortunately my uncle, who is a doctor, looked at it in a different way. He said, "Stuff and nonsense; lot of old women; do the boy good; shake up his liver." Well, now, here's the funny part of it, for *I don't find I get shaken at all*, and I believe it is all rot about the vibration. People *think* the machine quivers a lot simply because they hear the engine coughing, because it is not properly silenced like it is on a car. And I think there are a lot of people who would get a motor bicycle if it were not for this stupid idea. Also I must say I hate the way the dogs come round in the country when they hear my machine approaching. I nearly had a bad spill the other day because of this.

When I get a bit older I intend to get a Rover, which is the most silent motor cycle I ever heard. My brother, who thinks no end of himself because he is an engineer, is very keen on the Douglas because of its "even talk," as he calls it, and it is certainly very silent and smooth purring, but I like the Rover best. GEORGE RENN.

Running Costs.

Sir,—"E.W.B.'s" costs, as published by you, were of great interest to me, as I also ride a Douglas and keep a careful account of the annual costs. I agree that in order that the "running cost" may be arrived at correctly the cost of the tyres, chain, and belt used must be included under "running costs" and the amount be deducted from "depreciation." I have followed out this principle in working out the costs for 1913 and 1914 with two new Douglas machines as follow:

	1913. 4,400 mls. £ s. d.	1914. 5,000 mls. £ s. d.
Depreciation of machine, accessories, and spares	8 3 10	8 9 9
Running costs (fuel, tyres, etc.)	7 18 7	8 17 8
Fixed charges (licences, etc.)	2 17 8	3 6 3
Wear and tear of waterproof clothing, etc.	15 0	15 0
Total	£19 15 1	£21 8 8
Total cost per mile run	1.08d.	1.03d.
Running cost per mile run	.43d.	.43d.

The depreciation being practically a fixed amount per annum, it will be seen that any excess of 5,000 miles can be done at ½d. per mile.

Petrol consumption comes to 96 m.p.g. this year, against 129 m.p.g. last, when I used a very small jet, but my 1914 heavy consumption is partly due to the fact that during the early part of the season I wasted considerable fuel owing to valve and magneto timing being wrongly set.

I think few riders obtain cheaper motoring, and I venture to say that the Douglas would be a still more popular machine if Messrs. Douglas could let us have more easily removable cylinders, completely enclosed chain drive (with sufficient clearance to be able to fit a chain with bolt and nut fastening), larger sized chains and tyres, and accessibility to magneto without removing flywheel. NAIRN.

The Break of Platinum Points.

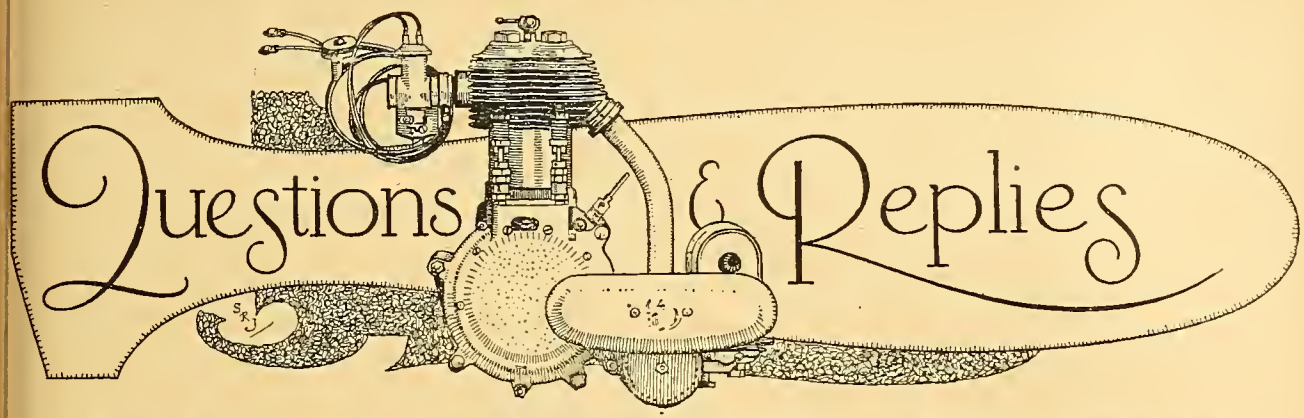
Sir,—I notice a letter under the name of W. Pointer with the following paragraph (issue December 10th): "The unaccountable sluggish running of an engine has been improved by *increasing the break* of platinum points."

This is a little phenomenon which I have been conversant with for some time, and I would like to see the matter discussed (if of interest), because I have come to the conclusion that sufficient regard to what I may term *arc of opening in relation to engine speed* has not been paid by magneto makers.

It appears to me that some engines of a low revolution power require a prolonged "dwell" before the break is *closed*. This idea is not synonymous with a retard of the break, and I feel that when this happens it must be due to the condenser of the magneto not being quite in proper proportion for the particular case, *i.e.*, either the condenser takes too long to saturate (electrically), or that it discharges too quickly (and consequently is not hot enough).

I have come to the above conclusions because I have found that on a high speed engine the points had to be fixed as close as possible, so decreasing the "arc of opening," to obtain good results, and on a low speed engine it required to be opened four times the amount.

GOVERNOR BALL.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Engine Stops on Engaging Clutch.

Can you tell me why my machine runs well on free engine but on letting in the clutch it stops firing?—J.H.

The engine probably stops because you do not accelerate sufficiently before engaging the gear. Also, the clutch should be engaged very gradually.

Exemption from Licence.

I have a motor cycle and sidecar fitted with box body, which is used solely for trade purposes. My name and address are printed on the front, back, and sides. I have not paid the revenue tax, but have recently been informed that I am liable for it. Can payment be enforced?—F.A.M.

If the machine is used solely for trade purposes and the trade body is not taken off and a touring body fitted on any occasion whatsoever throughout the year, no local taxation licence need be paid.

Newcastle-on-Tyne to Manchester.

Can you oblige me by stating what you consider the best road from Newcastle-on-Tyne to Manchester?—W.R.H.

Your best route would be as follows: Newcastle, Durham, Darlington, Northallerton, Boroughbridge, Knaresborough, Harrogate, Blubberhouses, Skipton, Colne, Burnley, Accrington, Bury, to Manchester. We are afraid that the last part of the journey will not be very pleasant, but there is no better alternative route.

Sidecar Springing.

Which system of springing do you consider to be the best for a sidecar combination: Front and sidecar wheels sprung and driving wheel rigid, front and rear wheels sprung and sidecar wheel rigid, all three wheels sprung, or only front wheel sprung?—J.H.G.

Undoubtedly, the best system would be to have all three wheels sprung. It does not make very much difference from the passenger's point of view, but, naturally, from the driver's point of view the best sprung combination all round is the most comfortable.

Magneto Terminals.

I have bought a magneto, but am rather puzzled how to wire it up. There are two terminals, one for the plug and one on the coutact maker cover. What is that for? Is it for a wire to run to the frame?—NOVICE.

The only terminal you need connect up is that leading to the sparking plug; the other is for the switch. If you care to have one, put the switch on your handlebar and run a piece of low tension wire from it to the terminal on the contact breaker.

Care of the Circulation System.

I think the most interesting and instructive portion of your delightful paper is that devoted each week to "Questions and Replies." Early in May I purchased a 3½ h.p. water-cooled Humber which has given me every satisfaction. Now that the winter has set in, and as it is uncertain how long the machine will have to be kept in the shed, I should be grateful for your advice in the treatment of the water tank and the various channels through which the water passes. I frequently drain off the water by means of the tap provided, and when doing so the water is very rusty, and, after pouring this away, there is, of course, a sediment at the bottom. Having completely emptied the water out, I leave the tap open and pour clean water through the tank so as to let it clean all parts as much as possible. Although the water may be drained off there is bound to be a certain amount of moisture left in the various parts sufficient to go on rusting. Is it advisable to keep the water drained off when not using the machine day by day? Would paraffin, or thin oil, poured into the tank and allowed to run through, prevent the rust eating through the different parts?—E.W.S.

It is quite beneficial to empty the water from a water-cooled engine at frequent intervals. This rusty deposit is nearly always present, but can be minimised by using rain water only. You need not mind the rust; all you have to fear is freezing. On frosty nights the water should be carefully emptied. The rust only attacks the surface of the metal. Washing out the circulation system occasionally with a saturated solution of washing soda is beneficial.

Fitting a Sidecar.

Will you kindly let me know the correct way to fit a sidecar? What I wish to know is, ought the sidecar wheel to be level with the back wheel of the motor cycle or three or four inches ahead of motor cycle wheel, as I notice some have the wheels quite opposite each other, others have the sidecar wheel 6in. ahead of motor cycle back wheel?—M.E.P.

Theoretically, the two wheels should be level, but practically, it is quite satisfactory to have the sidecar wheel a few inches in advance; this is more convenient in most cases, and is the plan most usually adopted.

Avoiding Brentford.

Would you kindly give a route from Great Portland Street, London, W., to Wellington College, Berks, avoiding tramlines altogether? It is fairly easy to find a route from Great Portland Street on to the road through Egham and Staines, but I wish to avoid the tramlines between Hounslow and London.—J.M.B.S.

We should recommend the following route: Great Portland Street, Marylebone Road, Oxford and Cambridge Terrace, Bayswater Road, go down Holland Road into Hammersmith Road, across Hammersmith Bridge, and go through Castelnau, over Barnes Common to Richmond. Halfway up Richmond Hill turn to the right and cross the river again. Here you have tramlines for a short distance, but these cannot possibly be avoided. When you come to a railway bridge you will see that the trams branch off to the left; you keep to the right, and follow the signposts to Staines. This is quite a good way out of London. From Staines you go through Bagshot and Camberley to Wellington College, which is near Crowthorne.

Silencer for Two-stroke.

I think of buying a two-stroke cycle, but think them usually rather noisy. Could I have any silencer fitted, say a Clair, or does this type of engine have to have a special silencer.—B.E.F.

The silencer in question should do a great deal towards rendering quiet a machine of the type referred to in your letter.

The Local Taxation Licence.

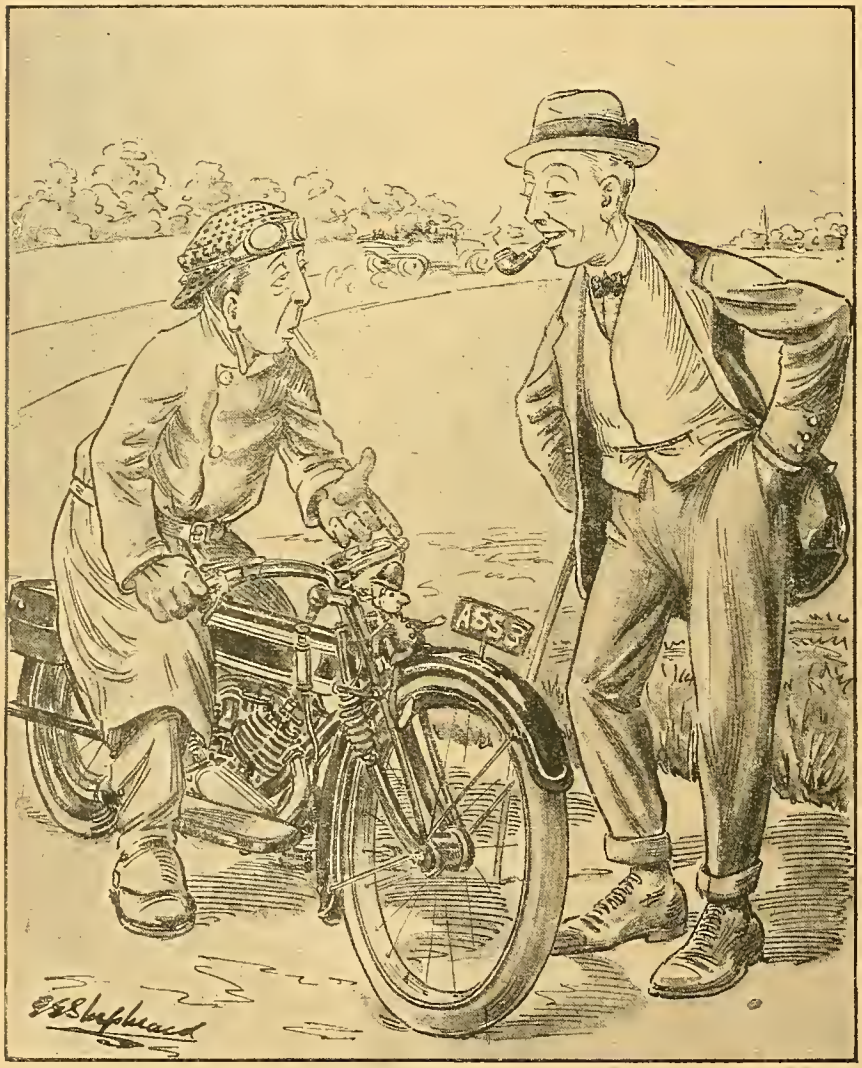
I have purchased a new solo machine delivered on Saturday, the 12th of December. By making use of the twenty-one days' grace would this obviate the necessity of paying the 10s. tax for 1914, as twenty-one days from 12th December means 2nd January, 1915, and on the 1st or 2nd of January I could pay the £1 tax for year 1915?—F.R.B.

We are afraid you will be under the necessity of paying the 10s. if you use the machine. You have twenty-one days' grace in which to pay the 10s., but you have to pay all the same. The only alternative is not to use the machine at all until 1st January.

Removing a Pulley.

I have a 3½ 1911-12 machine and am taking it down in order to rebush the main bearings. After taking off the expanding pulley flange, I find I am unable to remove the inner pulley flange, which appears to be made in one with the main shaft of the pulley. Is it necessary to remove this flange in order to remove the spindle from its bearing? Is this flange made in one with the spindle, or is it shrunk on to it?—G.F.

It is usual for the inner flange to be made in one with the boss, upon which the adjustable flange works. This boss is keyed to the engine shaft. It can be removed by a series of hard wood wedges placed between the flange and the crank case, and the end of the crankshaft tapped with a wooden mallet, or, better still, a pulley drawer may be used.



A DOUBTFUL COMPLIMENT.

"Hello! old chap, got a new mount?" "Yes, dear boy, two-cylinder, three-speed, magneto, spring forks——" "And fool proof, I presume?"

Control for a Philipson Pulley.

What is the best control for a Philipson pulley—hand or foot? My machine is a 3½ h.p. single.—T.M.

The best method of control for the pulley is a device shown in our issue of December 10th, sold by Messrs. Bowden Wire, Ltd. The control is by hand and Bowden lever.

An Expired Driving Licence.

I was driving a car recently when I was asked by a policeman for my licence. I had it with me, but found it had run out last September, and I had forgotten to renew it. Should the authorities have advised me that the renewal was due, and, if so, would that be sufficient excuse?—D.J.

There is no obligation on the part of the authorities to remind you that your licence is about to expire. In some districts the authorities are kind enough to advise you, but in many places they do not, and the onus rests solely with the holder of the licence. The police will now be quite in order in prosecuting you for driving with an expired licence.

The Local Taxation Licence.

Will you kindly tell me whether I am bound by law to take out a licence to keep a motor bicycle which I find I shall not be able to use until about June? Must I take out a licence at once, or will it do in June?—F.H.W.

If you have not used the machine during this year there is no need to take out a licence until you commence to use it in June, when the licence must be obtained within twenty-one days of the date when the machine is first used. If you have used the machine this year you are liable for the licence fee £1 if used before October 1st, or 10s. if only used since that date.

A Sidecar for Security.

I have to ride about fifty miles each week over roads which are exceedingly slimy. Shall I do any harm to my 2¾ h.p. Douglas if I attach a sidecar to it in the winter (to be used without passenger) to lessen the risk of skidding? Of course, a Douglas is as safe a machine as one can have in grease, but on bad roads a bit less anxiety and watchfulness would be welcome, if it can be secured without spoiling the machine for its ordinary running in the summer. I am in a hilly district, but have nothing very severe—only long slopes—in this particular journey.—J.A.H.

The machine in question would take a light sidecar in fairly level country quite satisfactorily. It might, however, be advisable to lower the gear by means of the adjustable pulley, and drive carefully, so as not to rattle the engine to pieces.

EXPERIENCES WANTED.

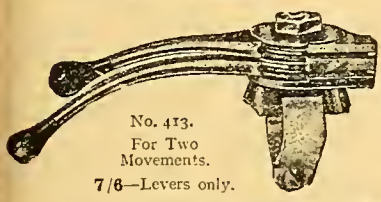
"X.Y.Z." (Herts.)—Omega two-stroke. Efficiency and durability.

"D.H." (Walsall).—Efficiency of F.R.S. electric lighting outfit on sidecar combination.

"J.F.R.W." (Suffolk).—Indian and Zenith for solo and sidecar work. Reliability, durability, and consumption.

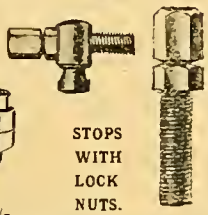
BOWDEN WIRE

BOWDENITE.



No. 413.
For Two Movements.
7/6—Levers only.

PORTABLE CLIP. 2/-



STOPS WITH LOCK NUTS.

A Catalogue worth having.

The Bowden Wire 1914 Catalogue contains 72 pages and over 100 illustrations of a great variety of Aids to Efficiency, designed by Experts of wide practical experience. It is a most useful guide. If you do not already possess one, write for your copy to-day.

Our manufactures include—

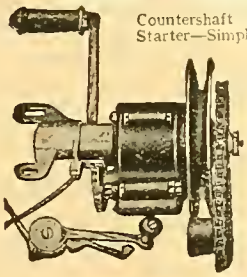
BOWDEN WIRE for controlling Brakes, Clutch, Air Inlet, Magneto, etc. Made in various strengths and finishes, at from **2d.** per foot.

BOWDEN CONTROL LEVERS used with BowdenWire Mechanism for Brake, Clutch, Air Inlet, Magneto, and other controls, are made straight or curved, and for one, two, or three movements.

STOPS & CLIPS Stops with Lock Nuts. For use with Bowden Wire Mechanism. When ordering, give number and description of wire with which stop is to be used. Price from **4d.** each. Clips can be had in great variety.

WHEN ORDERING send remittance to cover cost of postage—any balance will be refunded.

BOWDEN TWO-SPEED GEAR—



Countershaft Type with Kick Starter—Simply constructed—no complicated parts. Fits a number of machines without any, and most machines with slight alteration. Guaranteed for Engines up to 6 h.p.

Price from **£8 8 0**

BOWDEN RAPID VALVE GRINDER.

Helps you to grind a valve quickly and with absolute accuracy without dismantling cylinder. The most efficient valve grinder made.

Price 7/6

BOWDEN WIRE LTD, LONDON

Pratt St N.W.

Godbold.

MATCHLESS

POINTS OF SUPERIORITY.

No. 5. RELIABILITY.

Convincing evidence of the superior reliability of the 8 B Matchless lies in the fact that one of these famous machines was chosen in 1913 to represent Great Britain in the International six days' test of endurance, and was also again chosen in 1914. A dual honour that has been justified by unparalleled success in every form of competition where Merit Tells.

Remember that this choice was made by experts with intimate knowledge of all other motor cycles. *Verb. sap.*

H. COLLIER & SONS, LTD. PLUMSTEAD S.E.

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 31st, must be closed for press earlier than usual. All copy and instructions for paragraph advertisements in that issue must therefore be in our hands not later than first post on Thursday, Dec. 24th.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C., the ideal 3½h.p. Call or write for trial runs, etc. No obligation.—Reg. Lucas, M.C. Garage, Brunt St., Mansfield. [XS518

EG

CASH SALES.

To cash purchasers we have a few new motor cycles and light cars of this year's manufacture to offer at considerably reduced prices. We can also allot early delivery dates for all 1915 models (some are ready now), and for these goods we are continuing our system of

EXCHANGES.

Write for our "Exchange Form." It will enable you to easily describe your old machine; and immediately upon receipt of the particulars we will quote you a definite allowance. If desired, the balance can be sett ed by our convenient method of

DEFERRED PAYMENTS.

Our terms are cash (or its equivalent) for one-fourth of the purchase to be paid down, and the remainder is payable in twelve equal monthly instalments. These terms also apply to our

SECOND-HAND MACHINES,

a selection of which appear below. Each of these machines have been very carefully overhauled and tested, and we give a guarantee of their perfect condition. We will with p easure forward a complete list of our stock upon request.

If you wish your belt to last longer—fit

the ORIGINAL SPARE LINK—

When we designed it we made it to fit ANY Hook Fastener, so that every motor cyclist can enjoy the advantages it gives.

Note that by using the "Stanley" Spare Link there is no jerk as the Fastener passes round the pulley, the drive is more even, and there is no tendency for the Fastener to pull out, thus considerably increasing the life of a belt.

SOLD BY ALL AGENTS AT **ONE SHILLING**

THE BEST FASTENERS—

STANLEY 9d. and LION 6d.

as ordered by H.M. War Office, are supplied either PLATED or BLACK.

OF ALL AGENTS.

CRACKED Cylinders, castings, forgings, etc., successfully repaired by Lea's metallurgical process.—Lea, Engineers, Runcorn. [5197

WELDING.—All metals, cylinders, and crank cases. We have the plant, experience, and method for every job. Quick delivery.—Below.

CYLINDERS Re-ground, new pistons fitted, complete with rings, etc.; 22/6.—Oxy-acetylene Welding, 349 Lillie Rd., Fulham. 'Phone: Hammersmith 1617. [6430

MINERVA Spares, cylinders ground, pistons fitted, re-bushing, parts duplicated.—Ellenborough Motor Works, Ellenborough Rd., Wood Green, N. [8394

WELDING, broken cylinders, flanges, pistons, crank cases, repaired and machined. Scored cylinders filled in and re-ground to existing pistons.

CYLINDERS Re-ground, new pistons fitted complete, overhauling, re-bushing.—West London Welding Co., Essex Place, Chiswick. Tel.: 536. [9781

PISTONS, fitted with top and bottom step-cut rings, hardened steel gudgeon pin, and your cylinder re-bored and ground, 24/-.—C. R. Foster, Kirkstall Rd., Leeds. [0310

AUTO-WHEELS.—Have your Auto-Wheel tuned up and overhauled by the makers; price quoted, collection and delivery free in the London area.—Auto-Wheels, Ltd., Russell Rd., Kensington. [9260

TONOE Welding Works, 174, Oldham Rd., Middleton, Manchester.—Experts in broken cylinders, crank cases, etc. Welding aluminium a specialist. Nothing too difficult. Sound work at moderate charges. [9189

COMPRESSION.—Cylinders re-bored and ground, new pistons, rings, and gudgeons, complete, 16/-; overhauling, re-bushing, efficiency guaranteed.—Reliance Motor Engineering Co., Spon Lane, Smethwick, Birmingham. [9040

CRITERION Motor Works.—Cylinder grinding specialists. Our cylinder grinding is perfection, 18/6, inclusive, up to 86mm. bore. We specialise in complete engine overhauls, and guarantee thorough practical efficiency.—11, Criterion Mews, Upper Holloway, London, N. 'Phone: Hornsey 1147. [9452

REPUTATION.—The value of a good reputation is never so fully realised as in abnormal times such as the present. That is why our business is proceeding as usual. Let us quote you for any class of motor repair work. Cylinders re-ground; new pistons fitted; frames set down and modernised; re-bushing, etc.—Patricroft Motor Co., Patricroft, Manchester. [9605

MORMAN and Bliss, London Rd., Hoonslow.—Reduced prices during war. C.I. pistons, rings, and gudgeons, from 9/6; bushes, 2/-; valves, 3/-. Simplex steel pistons, hollow connecting rods, supplied to order. Special silencers, aluminium ends, steel barrel, and extension pipe, smart, efficient; twins 18/6, singles 14/6. Illustrated list free. [7541

Proof of Quality of a Beldam Retread

Cosham, Nov., 1914.

"During October, 1913, you retreaded a Motor Cycle Cover for me. This cover has run on my T.T. Peugeot some 5,000 or 6,000 miles, out of which 200 odd have been done with extra passenger's weight The first puncture occurred last week, when I noticed tyre had worn very equally all over, a proof of the quality of material used in Beldam Retreads."
E.W.B.

We retread Tyres so skilfully and with such good materials that the retreads often last longer than new covers. Thus you double the life of your tyre at little extra cost. Send for retreading list. It contains full particulars of cost of Retreads and Repairs.

War and the Motor Cycle.

WE hope that manufacturers and others engaged in the design of motor cycles will take to heart the advice of a contributor in this issue to continue exertions in the matter of producing motor cycles or sidecar outfits for warlike purposes. Though the pleasure type of vehicle has been adapted to render yeoman service, there is no doubt that much is left to be done in the way of producing a machine particularly suited to the special conditions of warfare. It seems to us that, in particular, better protection is needed for the rider from stray bullets as well as mud. In connection with the transport of machine guns on sidecar outfits, there is no doubt that the motor cycle will be able to play a most important part. Military experts agree that the success of a machine gun battery is due entirely to its operators being able to seize any opportunity presented to it. That opportunity does not exist frequently or for long stretches at a time, as no human body can stand up to the terrible effects of a modern machine gun. On this account, the speedy and mobile motor cycle and sidecar is particularly suited to the work. It is able to move the gun rapidly from one point to another wherever a vulnerable point is likely to present itself, and half an hour or so later be twenty miles away ready to repeat its deadly work on another detachment of the enemy.

We dwell upon the military aspect of the question to show that, with proper attention to developments, the motor cycle and sidecar has found a lasting place in the Army, and, as it is quite a new branch of the Service, it is fairly obvious that much remains to be learned in the production of the ideal machine for the work. Those who turn their attention to a serious study of the conditions while the matter is young are likely to reap the benefits. We urge manufacturers in 1915 to pay special attention to the production of a motor cycle or sidecar outfit for warlike uses. There is ample scope to warrant such a step.

Buying Second-hand Machines.

AT this period of the year, those in possession of the necessary funds and on the look-out for a motor bicycle are able to pick up a very sound bargain. Particularly do these remarks apply at the present stage of affairs. Quite apart from the fact that many enthusiastic motor cyclists dispose of their old machines in the winter in favour of a new model to be delivered in the New Year, there is no hiding the fact that money is not being quite so freely spent on what some people still regard motor vehicles of all kinds, viz., luxuries. We have had evidence of late that there is considerable activity in the second-hand market, and, moreover, a number of cases of what we should characterise as real bargains have come directly under our notice. Hence our remarks to those who may be considering the purchase of a second-hand mount that now is an opportune moment for such a speculation. Those who are limited in funds have the opportunity of making any small improvements or adjustments during the winter months or the less active season, and so being ready for the call of the road in spring-time. We are occasionally asked by readers to assist them in the selection of a second-hand mount, but, though we have helped many Overseas readers, who are more awkwardly situated, we find that such a scheme is almost impracticable so far as home readers are concerned, as ideas on the subject of a bargain differ so very much.

Will the Solo Mount Survive Winter in France?

By H. MORTIMER BATTEN.

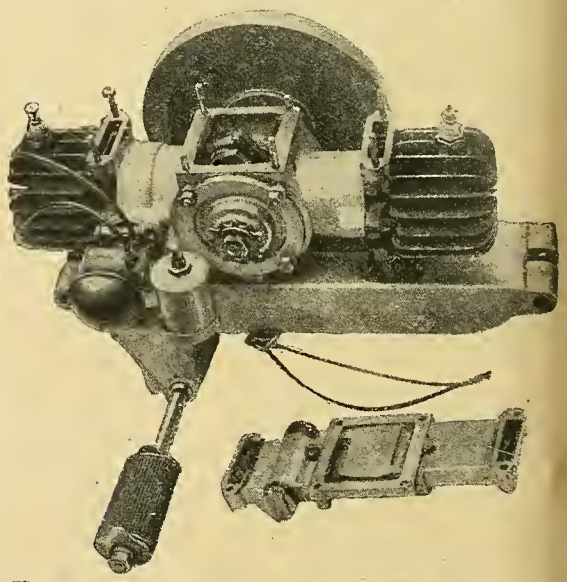
THE ADOPTION OF SIDECARS FOR DESPATCH RIDERS.

A group of British motor cycle despatch riders photographed in wintry surroundings. Five of the nine bicycles are Clynos provided with sidecars—a very desirable provision during the winter campaign, as we have already pointed out in a leading article.

AS was outlined in *The Motor Cycle* of last week, it is reported from France that, owing to the awful condition of the lines of communication —a condition, be it noted, that is mainly due to the constant passage of four-wheeled rubber-tyred vehicles —the motor cycle has lost much of its usefulness, and is in danger of supersedure by the light car. The mud on most of the roads is so deep that the work of riding through it on a single-track machine is most exhausting for the rider, and in many cases is slow and almost impossible. If the conditions are as bad as this, the solo mount cannot be entirely suitable for the work. The likelihood of coming to grief at any moment, of colliding with other traffic, the constant tension to which the rider is put—especially at night —in order to keep himself and his mount right side up, must be trying in the extreme.

This, however, is a trouble which can be so easily overcome that it is not reasonable to suppose that on such scanty grounds the machines will be pronounced unsuitable for those particular services in which they have already proved their worth. The points in favour of the motor cycle are so evident that it is hardly necessary to dwell upon them. All that is required is a third wheel to steady the machine and keep it upright, and a special standard fitment could quickly and cheaply be produced that would entirely overcome the trouble. It would consist merely of a sidecar chassis, mounting a sprung bucket seat for conveying a passenger, and so equipped that spare tyres, petrol, food, water, or any other necessary impedimenta could be carried aboard. There is an immense future for such an attachment, for not only would it put an end to the skidding trouble, but it would enable the rider to carry certain articles with him that cannot be carried on a solo mount, thus adding much to his comfort, and withal it would add little to the weight and deduct little from the handiness of his machine. The lifting danger at corners would be overcome after a little practice.

Messrs. Phelon and Moore are already experimenting with an attachment of this kind, and *The Motor Cycle* has arranged a trial in which the light attachment will figure. The course selected is one of extreme severity, including road surfaces as nearly representing the present mud tracks of France as our West Riding byways and moorland paths permit.



The engine of the two-cylinder two-stroke Connaught which was described on page 706 of our last issue. The transfer pipe, which forms the lid of the crank case and support for the magneto, is shown detached. Both cylinders of this engine fire together and at every complete revolution.

OCCASIONAL COMMENTS

BY "IXION"

I Recant.

I have often attacked the trade with a venomous pen for the starting difficulties with which their designs beset us in winter. I humbly ask their pardon. During the recent cold snap my unheated shed has housed a baby two-stroke and a four-cylinder sidecar, both of which run on an appallingly heavy mixture of Taxibus and benzole. Believe me if you can, but both engines invariably start at the first attempt. The two-stroke bursts into raucous song if I give its back wheel a single finger-tweak, and the four-cylinder does not even require me to pull out the radiator button which shutters the air intake. By the way, the two-stroke has just finished 1,500 miles without being decarbonised, and is still pulling well; but then it hasn't got that "petroil" lubrication, about which I used to rave before I knew as much as I know now. Most two-strokes collect a black glutinous ooze in the neighbourhood of the carburetter, no matter what type of lubrication they affect.

Sidecars for Despatch Riders.

If the suggestion made in our leaderette of December 10th is taken up, and the Government begins to employ sidecars for military despatch riding, not the least advantage of the move will consist in the detachable wheels, which should surely form part of the specification of every such three-wheeler. I am not a little surprised that fixed wheels have been accepted for the sidecar machine gun batteries, though detachability is less likely to be useful on machines which would generally be under gunfire when punctures befell them. Yet even a gun-carrying sidecar should have detachable wheels; the history of war is not destitute of incidents when a wheel taken from a limber has been utilised to carry a gun out of action, and save it from capture; if wheels are sometimes changed under fire by horse artillery, why not with sidecar artillery? There will be no excuse for accepting fixed wheels on despatch sidecars. Time is always of value, punctures are the commonest causes of stoppage, and such punctures would seldom be sustained under fire.

The Cold of it!

It is a thousand pities that Mr. A. V. Roe is so busy constructing aeroplanes for dropping bombs on Germany's aeroplane factories, for he is the only engineer who has ever tackled the weather-proofing of motor bicycles in a genuinely sensible fashion. I had to take out my baby two-stroke at very short notice not long ago, and as it was just an ordinary rather-cold-and-very-sloppy winter day, I did not pause to don the usual South Pole equipment of finnesko, bearskin, etc., but rashly took the road clad in huge farmer's brogue shoes, thick gabardine leggings, Harris tweed coat with double leather lining, lined stormcap, and German indiarubber gloves. When I got home two hours later, my exterior surfaces would have fetched high rents as small holdings; I was wet through from the waist to the feet: and even my upper storey had begun to freeze by conduction. I know I ought to have had footboards and a mudshield; but the makers do not provide them gratis, and one cannot be perpetually changing them from one machine to another. Who will be the first to bring out the roughrider's canoe-cum-coffin-bodied motor bicycle? I sat in front of a roaring fire at the club for half an hour, and my teeth had hardly stopped chattering then, though it was not freezing, and the mud and water on my person were mostly collected off the road—I had only run through a couple of light showers. During the last three weeks I have hardly met a single motor cyclist on country roads, exclusive of the khaki despatch riders, who are training hard for the snow and slush of Flanders.

Driving a Dud.

I very seldom handle a machine which I know to be second-rate, but the other week, in a temporary emergency, I borrowed a machine of recent date made by a firm whose reputation has always withheld me from joining their *clientèle*. It was a most interesting experience. The machine is reliable enough, for I know its history; and it has plenty of power, for it climbed hills quite masterfully. Its weakness was concentrated in the engine, for it was totally devoid of balance. It started easily and pulled well; it even proved much more docile and manageable at traffic speeds than most of its more famous rivals, for it required no driving, and was perfectly agreeable to jog along at ten or fifteen miles an hour, without any carburetter humouring. But when I got it out on the open road, and tried to open up to a modest average of thirty miles an hour, it sought out every joint in my body, and attempted to disintegrate them all. Ugh!

Stuck Piston Rings. A Two-stroke Tip.

The commonest cause of lost power with a two-stroke engine is a stuck piston ring; indeed, it is almost the only engine failing, outside carbonisation, which is conceivable. It is further obvious that the ring can only stick during the cooling process, when the hot engine is put away for the night, and the film of semi-carbonised oil glues it into its groove. It is even likely that the sticking oftenest occurs when the piston is left low down on its stroke, where the cylinder bore is least worn. The trouble may, therefore, be reduced or avoided by injecting a squirt of paraffin when the machine is put away, which will go far to prevent the congealing of the oil; and by leaving the machine with its piston up rather than down. Unfortunately some of the small two-stroke engines have no provision for injections. (It is easy to make a punch mark on the flywheel to indicate whether the piston is up or down.)

Demolitions Fired by Magneto.

By HUGH B. C. POLLARD, Lieut. 25th C. of L.

SOME time ago it occurred to me that the magneto of the average motor cycle was capable of being used to detonate an electric fuse, provided that the low-tension current, not the high-tension circuit, was used.

Some makes of magnetos are provided with a terminal projecting from the contact breaker cam ring. This is usually known as the switch terminal, and is often connected to a handle-bar switch or through a condenser coil to illuminate a tail lamp. In the case of the switch it is an "open circuit," the return current passing through the frame, so that closing the circuit by pressing the switch cuts out the primary current or "low tension" of the magneto so that no secondary or "high tension" current is induced and no spark passes across the points of the plug.

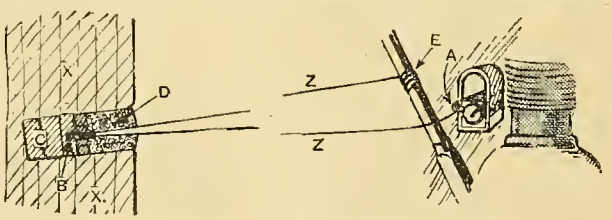
In the modern magneto the low-tension current generated when the engine is moving at a fair rate is considerably in excess of the actual current needed to induce a good spark from the secondary winding. This excess of current is, however, necessary for easy starting when the engine is moving at a very low speed.

Various Methods of Exploding the Charge.

In the usual demolition a detonator is inserted in a primer, the primer in the explosive charge, and the detonator itself exploded by means of a powder fuse. This is the usual military method. Modern civilian practice in the mining and quarrying industries throughout the world have long since adopted the electric fuse and detonator in place of the old powder fuse method. The electric fuse-detonator consists of a water-tight copper capsule, into which pass two insulated wires joined at their head by a twin bridge of platinum wire. The whole of this is embedded in the detonator explosive—fulminate of mercury. When a current is passed along the wire leads the resistance of the platinum wire is such that it grows red hot and fires the detonator. This explodes the primer and the primer explodes the whole charge of explosive.

I have since carried out experiments to prove that the ordinary low tension current of a motor cycle can be used to explode one or more electric fuses simultaneously, its limit of efficiency being determined by the joint resistance of the fuses and that of the length of cable connecting the charge and the magneto.

The method is simplicity itself, an electric fuse is embedded in a charge, and the whole well tamped in position; the ends of the detonator leads (fuses are usually supplied with 48in. leads) are left hanging outside the tamp hole. These are cleaned and connected to a twin-flex cable, the other end of which is attached, one wire to the low tension terminal and the other to the frame of the motor cycle. The cycle is on its stand, and the mere action of starting up the engine suffices to send a current along the cable and explode the charge.



A. Low tension terminal. B. Fuse detonator. C. Charge.
D. Tamping XX. Brickwork to be destroyed. ZZ. Cable (say 120 yds.)
E. End of cable fastened to frame.

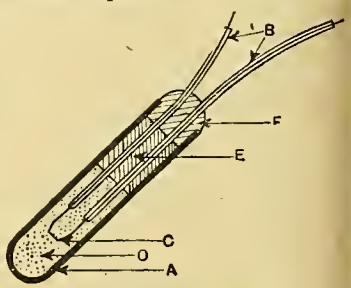
NOTE.—No switch is shown or needed, the completion of contact by touching one cable end to frame or terminal is sufficient to act as switch.

Assuming the current at our disposal to be 8 volts. The resistance of the fuse to be 3 ohms and the resistance of suitable cable to be 5 ohms per 100 yards, we can estimate that a charge can be fired from a point at least 150 yards away.

Advantages of the Electric Fuse.

This enables a motor cyclist to be left in charge of a mined position such as a bridge, and provided that he is safely hidden under cover and his cable concealed, he can wait till the enemy are actually upon the bridge before firing the charge. For firing several charges simultaneously electric fuses are vastly preferable to the precarious business of lengths of ordinary fuse spliced to lengths of instantaneous fuse in a "junction box," and here the motor magneto is decidedly useful.

The service explosive is slabs of gun cotton into which are inserted small disc primers of the same material; these have a small hole bored in the centre to accommodate the pencil-like detonator, and the electric fuses fit these holes without further adaptation. For the purpose of hasty demolitions full instructions and formulæ with regard to the proportion of explosive to material to be shifted are given in the various service text books. It is, however, a simple matter to train men to use the electric fuse, and there is no doubt that it is a far safer method than the usual powder fuse and detonator system. Electric fuses can be got from any explosive factory or acquired locally wherever mining or quarrying is in progress. The cable can be speedily laid along a road from a hand reel carried on the machine, and the same cable can be used time after time. The experiments so far carried out reveal the usefulness of the system, and it must be said that it would add largely to the possible military value of the military motor cyclist if he were instructed in the execution of hasty demolitions by means of the electric fuse fired from his machine's magneto.



Electric detonator fuse.
A. Copper tube closed at one end.
BB. Insulated leads.
C. Platinum wire bridge.
D. Fulminate of mercury (explosive).
E. Plaster of Paris plug.
F. Waterproof wax plug.

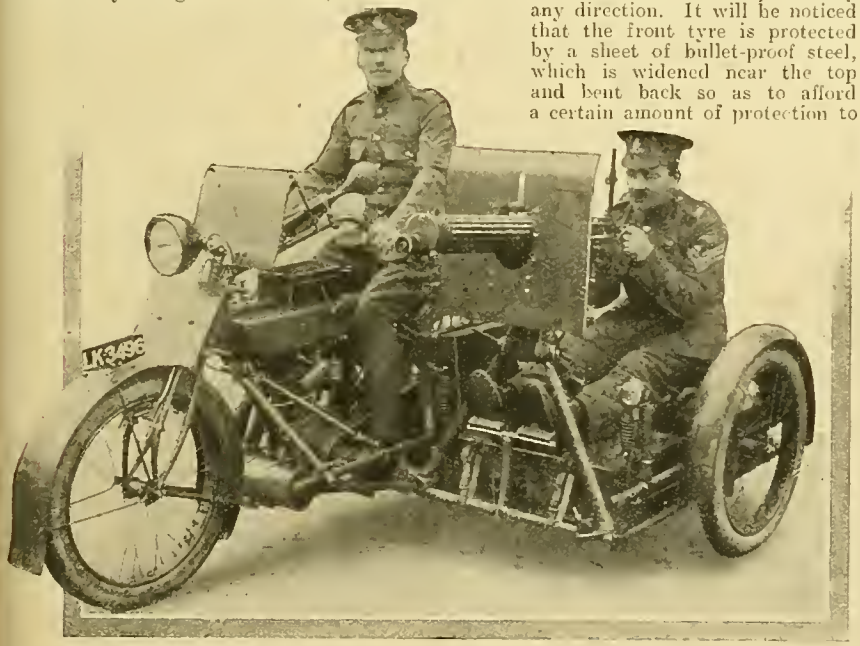
MOTOR MACHINE GUNS FOR THE FRONT.

We have received quite an interesting letter from Sergeant-Artificer Longfield, who by the time this appears in print will be in France with the No. 1 Battery of the Motor Machine Gun Section. This is the first of the new batteries, in which all motor cyclists will take an unusual interest, to be despatched to the Front, and doubtless by now it will already have given a good account of itself. The battery consists of eighteen Scott machines. Of these, six carry the latest type Vickers automatic gun, six are spare gun carriages, and six carry ammunition. Longfield is the mechanical expert in charge of the fleet, while Frank Philipp is stationed at Bisley as chief instructor and demonstrator of the Scott machines. We shall await with interest accounts of the performances made by this new branch of the service—we can wait with confidence; meanwhile, the best of good luck to the crews of the eighteen Scott machines and those in command!

Frank Philipp (centre) and four sergeants of the No. 1 Battery Motor Machine Gun Section. Reading from left to right: Swarbick, Longfield, Philipp, Boxall, and Macvie.

A MATCHLESS SIDECAR QUICK-FIRER.

THE amount of ingenuity displayed in designing the quick-firer machine gun sidecar combination is quite wonderful. The latest addition to the already imposing fleet of these mobile instruments of war is that turned out by Messrs. H. Collier and Sons, 44, Plumstead Road, Woolwich, S.W. The Matchless combination has a specially-built sidecar frame of great strength, and on it the gun is mounted on its own tripod, a most important matter, as it enables it to be quickly detached and carried anywhere with the greatest ease and celerity. Ingenious "turns," which can be released by undoing one screw on each, hold the feet of the tripod to the frame. The ammunition boxes are carried in a case on which the gunner's saddle and footrests are situated; the case is suspended on four spiral springs hanging from special columns brazed on to the frame. An ingenious clamp, visible on the rear of the vehicle, holds all the ammunition boxes together, so that they cannot possibly jump out or rattle. The gun is mounted high, and can be easily worked from the sidecar in practically any direction. It will be noticed that the front tyre is protected by a sheet of bullet-proof steel, which is widened near the top and bent back so as to afford a certain amount of protection to the tank, while a further shield is attached to the handle-bars, which affords a small degree of protection for the driver. The third member of the gun's crew is seated on a comfortable luggage carrier seat provided with a back, to be seen in one of the photographs we reproduce. The outfit is attached to a standard Matchless de Luxe sidecar machine equipped with the Lucas electric lighting outfit, and looks thoroughly businesslike.



The new Matchless machine gun sidecar propelled by a 7 h.p. engine through a three-speed gear box. Observe the bullet-proof steel guard, also the shield attached to the handle-bars, besides the usual protection around the gun.

THE VICKERS LIGHT MACHINE GUN.

THE machine gun which is supplied to the Government sidecar machines has frequently been described as a Maxim. This is an error, the gun is the Vickers light gun .303in. bore, and it differs from the .303in. Maxim in many respects. It is both lighter—weighing but 38½ lb. ready for firing against 65 lb. of the Maxim—and smaller in all its dimensions. The barrel casing is corrugated longitudinally, giving greater strength and cooling surface. The chamber is surrounded by water, which is not the case in the small Maxim. There is no ejector spring but an opening at the bottom of the breach through which the empty cases fall to the ground. The back sight is of the V pattern, and the fore sight a protected blade. Besides these points, which are easily seen, there are many detail differences. Some of the advantages are as follow: Lightness, simplicity, great strength, no tools required to strip lock or change barrel, better means of safety, *e.g.*, the gun cannot be fired unless the cover is down, faults more easily rectified, and the reverse action of crank shortens the breach casing. Thus it will be seen that the Vickers gun is more suitable than the Maxim for motor-cycle work.

1915 MODELS.

Descriptions and Illustrations of New Model Motor Cycles.

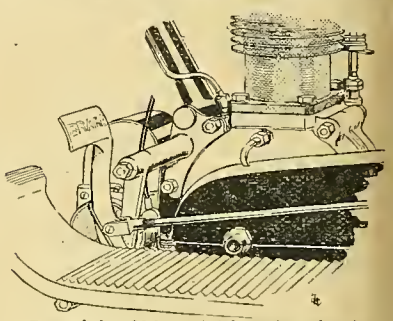
ARIEL REFINEMENTS.

NEITHER the twin nor the single-cylinder Ariel has been materially altered for 1915, but they have both undergone certain slight changes which are in the nature of refinements.

One is immediately struck by the sensible aluminium footplates with a curved toe piece and ribs, so arranged as to be easily cleaned. These plates will in future take the place of the covered boards previously fitted. A closer inspection shows that the spring forks are somewhat wider and stronger, and the front guard is increased in width to suit. The back hub also is wider, and the wheel more powerfully constructed so that the machine is suited for hard work over any surface, however bad.

The chain from the engine to the gear box is totally enclosed, and a pipe leads from the side of the crank chamber in such a manner as to blow oily vapour direct on to the chain and so keep it thoroughly lubricated while running. Inverted exhaust lifter and front brake levers take the place of the external type, and one of the most important requirements is the addition of a handle-bar control to the clutch. A lever is placed in front of the exhaust lifter, and is connected by Bowden mechanism to the foot control, so that two independent methods of withdrawing the clutch are provided.

An important feature of the Ariel motor cycles is that neither the twin nor the single is too heavy for solo work, though the fact that both types are fully capable of heavy sidecar work has been demonstrated often enough, and most of our readers will remember that the famous Bwlch-y-Groes was ascended with a hot engine by a standard 3½ h.p. and sidecar with a passenger of over eleven stone. That this performance was not only genuine but even accomplished with



Part of the 3½ h.p. Ariel engine, showing arrangement of chain lubrication, brake pedal, and new footboard.

EDITORIAL NOTE.

THE majority of 1915 model motor cycles have now been described and illustrated in these columns, and as a guide to readers we give below the dates upon which the different descriptions were published:

Sept.	3rd.	Henderson and Levis Popular.
,,	24th.	Lady's model Clyno and 2¾ h.p. two-stroke Singer.
Oct.	1st and also 29th.	Three-speed shaft-driven Rex.
,,	8th.	Radco and Abingdon.
,,	15th.	Ivy, Vindec, and 4 h.p. Brown.
,,	22nd.	J.A.P. engines, Calthorpe, Lucas dynamo.
,,	29th.	Quadrant, Harley-Davidson, Matchless Racer, Lea-Francis, J.H., and two-stroke Ariel.
Nov.	5th.	Sparkbrook, Lady's Metro, 2¼ h.p. and 6 h.p. Enfields, Omega, and 4 h.p. A.J.S.
,,	12th.	6 h.p. Humber, Sun Vitesse, and Levis.
,,	19th.	Diamond, B.S.A., 6 h.p. twin P. and M., Indian, Royal Ruby, Velocette, 6-7 h.p. Sunbeam, James, Rover, twin-cylinder two-stroke Premier, and New Hudson.
,,	26th.	Rudge, O.K. Junior, Wooler, New Imperial, J.H., Lady's Radco, Wulfruna, Bradbury, and Hazlewood.
Dec.	3rd.	Norton, Grandex, Connaught, Brown, Clyde, Brough, and Lady's Ivy.
,,	10th.	Allon two-stroke, Wulfruna, Premier two-stroke, O.K. two-stroke, A.J.S., and Velocette.
,,	17th.	4 h.p. and two-stroke Triumph, Radco, and Paragon two-strokes, Rex-Jap, Symplex, Bat, Connaught, Quadrant two-stroke, Twin Excelsior, Hobart two-stroke, and Hockley two-stroke.
,,	24th.	Burman 2½ h.p. engine, New Comet, 2½ h.p. Dot, Twin Connaught two-stroke, Premier and Zenith machine gun sidecar outfits.

Transmission side of the latest 3½ h.p. three-speed Ariel.

considerable ease the writer can personally guarantee, having been the passenger in question, the driver on the same occasion being F. C. North, who is at present at the Front serving as a despatch rider.

THE HARLEY-DAVIDSON BIG TWIN.

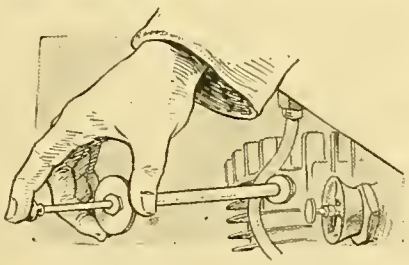
IN our issue of October 29th we published a short description of the 1915 Harley - Davidson models. On a recent occasion we had an opportunity of going carefully over one of these machines with the London agent, Mr. Robertson-Brown, of Messrs. Robertson's Motor Agency, 157b, Great Portland Street, London, W. In doing so we were able to appreciate to the full the excellence of the finish and the number of ingenious fitments with which the Harley-Davidson is provided. It is incumbent on us to mention that the 6 h.p. single-cylinder model illustrated in the issue previously referred to is not being sold in this country. In our former reference we described the twin engine in detail, so in the present article we need only deal with those small and interesting fitments which will appeal to the motor cycle connoisseur.

The carburetter is fixed on a flange on the inlet pipe by means of three big, fine threaded screws, and so can be dismounted without disturbing the inlet pipe unions. The mechanical oil pump, which we illustrated in our previous reference to the machine, is provided with a glass window through which the flow of oil can be clearly seen—a point which is of considerable importance.

It is interesting to note that the saddle position is two inches lower than it was last year, and yet the floating seat-pillar has more movement. The distance from the saddle to the ground is 29½in., and 3½in. tyres are fitted.

The kick starter is of the double type; in other words, it resembles a pair of ordinary pedals, though it is used solely for the purpose of starting the engine up, and causing it to revolve in order to test the ignition. It works through the gear box, and the whole of the mechanism is entirely enclosed.

A most noteworthy feature is the well-designed gate, provided with three notches for the three speeds and the neutral position, and the interesting interlocking device on the top of the gear box, the striking lever being supplied with a cam which engages in the notched



The Harley-Davidson combined filler cap and priming squirt. Observe the peculiar form of the compression tap, and the air intake of the carburetter with shut off valve to facilitate starting.

quadrant on the clutch lever, the object of which is to lock the change speed lever when the clutch is in, so that the gear cannot possibly be engaged and thus damaged. The change speed lever is coupled to the striking mechanism by means of a rod with a universal ball joint at each end, so that any strain on the striking mechanism is impossible.

Another excellent feature is the provision of big grease cups on the fork bearings, while a socket of great strength is fitted to take a fork bracket suitable for any make of lamp on the British market.

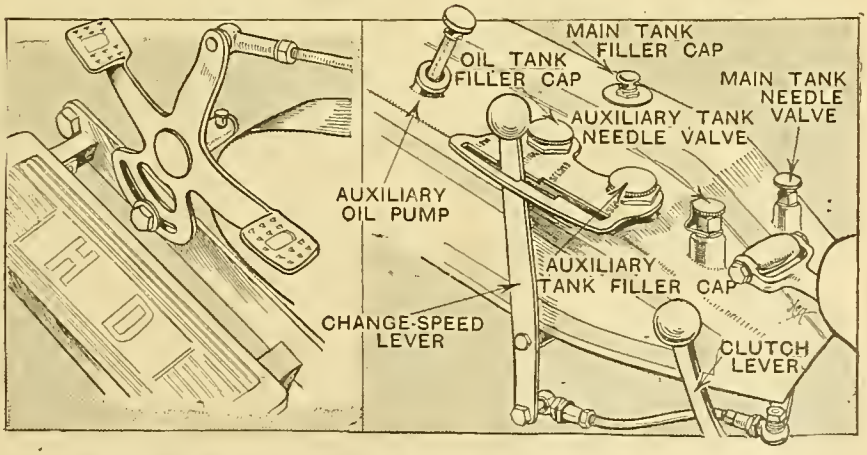
The clutch is provided with dual control, and the friction quadrant forms a part of the pedal, thus leaving the lever free of all encumbrances, or enabling it to be done away with altogether if the rider should desire it. Provision for adjusting the clutch is made through a hole in the front chain cover, through which the screws varying the tension of the clutch springs can be reached.

Larger size chains are fitted for 1915, which are lubricated by the oil release from the crank case. The lubricator for oiling the kick starter spindle is also worthy of mention, as it consists of a long pipe with a cap standing well above the bottom bracket, and so placed that it can be easily reached with an oilcan.

Ingenious Features

The emergency oil pump is provided with a catch which is released by turning round the milled nut on the top of the pump spindle. A long priming squirt is incorporated in the filler cap to the main tank, and the compression taps are of the screw valve type, and designed absolutely to fit the end of the petrol squirt. The tyre pump has no flexible connection but a rubber joint at the end, which can be pushed straight on to the tyre valve. The pump can then be worked with one hand, it being quite unnecessary to hold it steady. Two tanks are provided, the main tank and an auxiliary tank, each of which has a separate needle valve, the milled nut at the top of which is held up by a spring to prevent it vibrating either closed or open. The filler caps, both to the oil and petrol tanks, are of the anti-splash type.

The silencer is large, and there are no bends in the pipe which might cause back pressure. The control wires are of single strand, large size piano wire running in a casing, which in certain places is leather covered. Another excellent piece of design is the internal expanding double-acting brake.

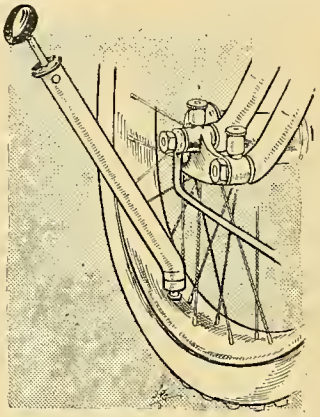


(Left) Friction quadrant for the clutch pedal and lever. (Right) Tank fittings on the 1915 model Harley-Davidson.

A SIDECAR WINDSCREEN.

A MOST practical windscreen for sidecars is being marketed by the Walbro Cycle and Motor Co., Lynn Road, Ely. It is made of celluloid, being finished off with leather beading; the frame is of flat steel. The screen is neat and light, and has been tried over a period of four months, the results obtained being very satisfactory. The Walbro windscreen, as it will be known, is being sold at £1 1s. each for fitting any coachbuilt sidecar. The illustrations show what a particularly attractive and effective article the new Walbro screen is, and how useful it is likely to prove in inclement weather.

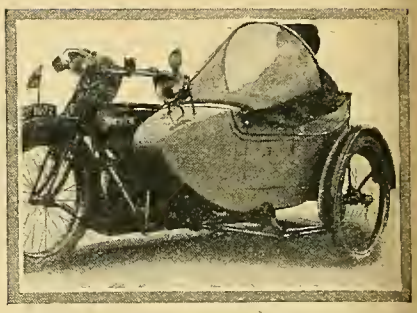
The Walbro screen is of light yet strong construction, and it in no way hinders entrance and exit to the sidecar.



The Harley-Davidson tyre pump. Note the grease cups on the fork bearing. (See previous page.)

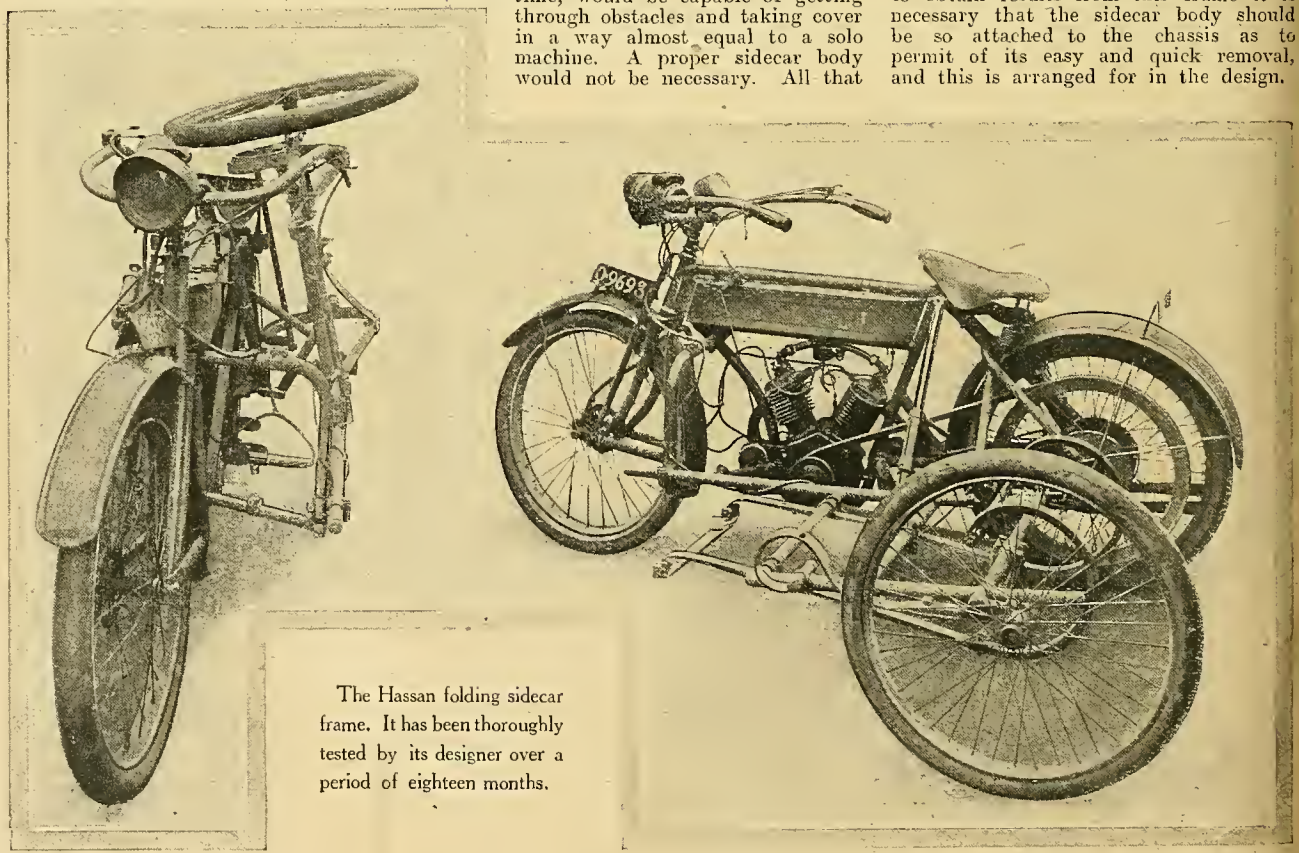
A FOLDING SIDECAR FRAME.

OUR recent leading article on the use of sidecars by military despatch riders induced Mr. F. G. Hassan, 44, Digbeth, Birmingham, to call our attention to his folding sidecar frame. It would get over skidding difficulties, and, at the same time, would be capable of getting through obstacles and taking cover in a way almost equal to a solo machine. A proper sidecar body would not be necessary. All that would be required would be a box in which spare petrol, oil, and tools could be carried; such an arrangement would give adhesion, and the box could easily be removed when required.



The new Walbro windscreen which has been "provisionally protected." It is made entirely of celluloid.

Sidecar users, too, who are very cramped for garage space will be interested in this sidecar frame. The chassis frame is made with a long longitudinal tube or bar capable of turning freely in forward and rear bearings attached to and projecting from the cycle frame, the rear bearings being carried by a horizontal and inclined stay. A folding inclined tube, on which there is a sliding sleeve incorporating a locking device, runs from the saddle tube to the centre cross member of the sidecar frame. The operation can be performed in a few seconds single-handed. Of course, to obtain results from this frame it is necessary that the sidecar body should be so attached to the chassis as to permit of its easy and quick removal, and this is arranged for in the design.



The Hassan folding sidecar frame. It has been thoroughly tested by its designer over a period of eighteen months.

"I Resolve

To specify Dunlops for my 1915 mount,

or

To replace my present tyres by Dunlops as soon as worn out."

These two alternative resolutions mark the first step in a successful motor-cycling season, since the user of Dunlop tyres enjoys greater immunity from side-slip, and less risk of puncture.

DUNLOP

motor - cycle tyres.

AN EXCELLENT LEAD.

The majority of manufacturers fit Dunlop tyres as standard. You cannot do better than follow their lead, since the manufacturer does not send out a high-grade model on any but high-grade tyres.

Ask your Agent for the A.R. leaflet, which gives particulars and prices of the 52 types and sizes of Dunlop motor-cycle tyres.

REMEMBER: Every Dunlop tyre bought helps to support the workpeople and tax-payers of your own country, and every foreign tyre bought—European or American—is a blow aimed at the industries of your own country.

The Dunlop Rubber Co., Ltd., Founders throughout the World of the Pneumatic Tyre Industry,
Aston Cross, Birmingham. Alma Street, Coventry.
Branches—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

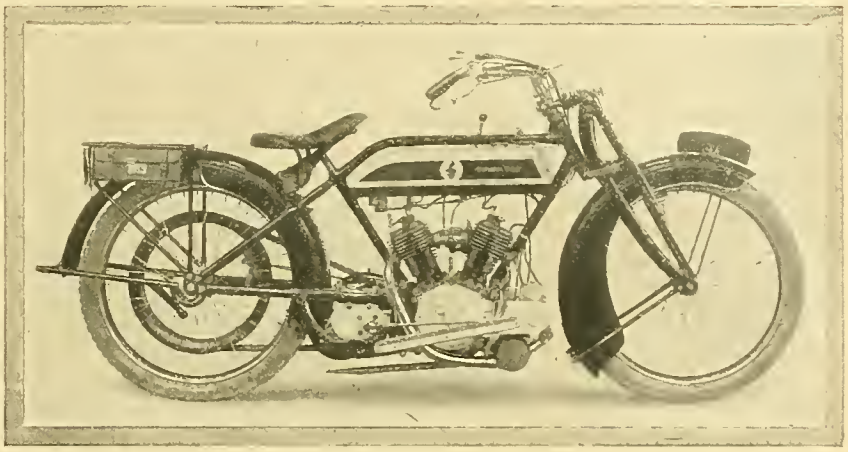
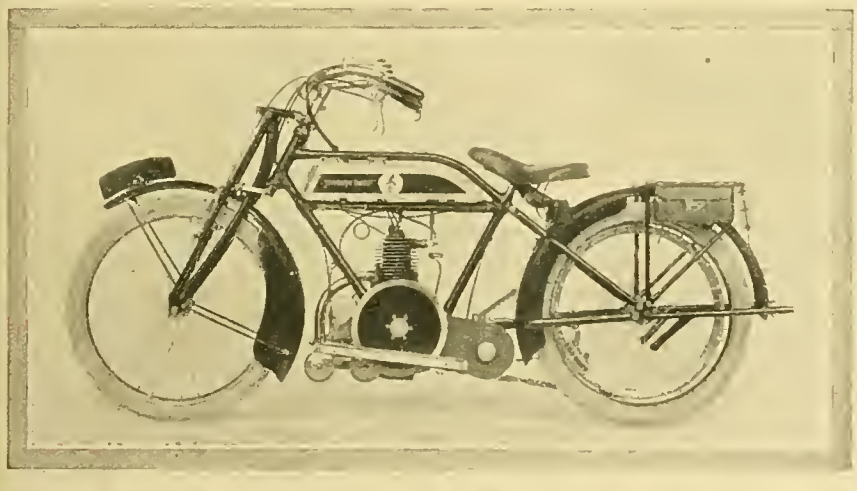
The Latest Coventry Eagle Machines.

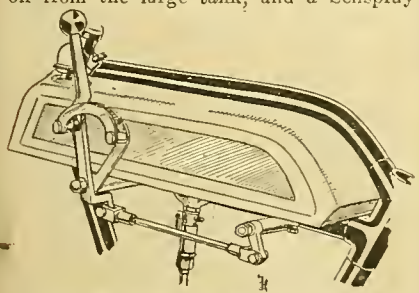
THE 5-6 h.p. twin-cylinder Coventry Eagle is a departure from former models built by the Coventry Eagle Cycle and Motor Company. It is a striking looking machine primarily designed for passenger work. At the same time the machine is not clumsy, and can be handled solo with ease and comfort. The engine is the twin Abingdon of 67 mm. × 95 mm. bore and stroke, and is carried in a powerful frame. Behind the engine lies a stoutly constructed three-speed countershaft gear, which is chain driven from the main shaft; both the chain and the kick starter are enclosed in a neat case. The final belt drive is admirably carried out, the front pulley being large and the rear pulley being comparatively small; thus, the belt is well above mud and water. The equipment is of the best, and includes Brampton forks, a large pan saddle, good footboards, and mudguards with deep valances. Both front and rear stand are fully strong enough for their work, and the carrier is fitted with metal covered tool bags. A Benton and Stone sight feed drip lubricator supplies oil from the large tank, and a Senspray or Amac carburetter may be obtained to order. We may safely say that the 5-6 h.p. Coventry Eagle is a most attractive proposition, and with its gear ratios of 4¼, 7¼, and 13½ to 1 and a well designed clutch, it is capable of hard passenger work and also of a good turn of speed.



The 5-6 h.p. twin-cylinder Coventry Eagle.



The Coventry Eagle two-stroke. Drive is by chain to a two-speed gear and thence by belt.

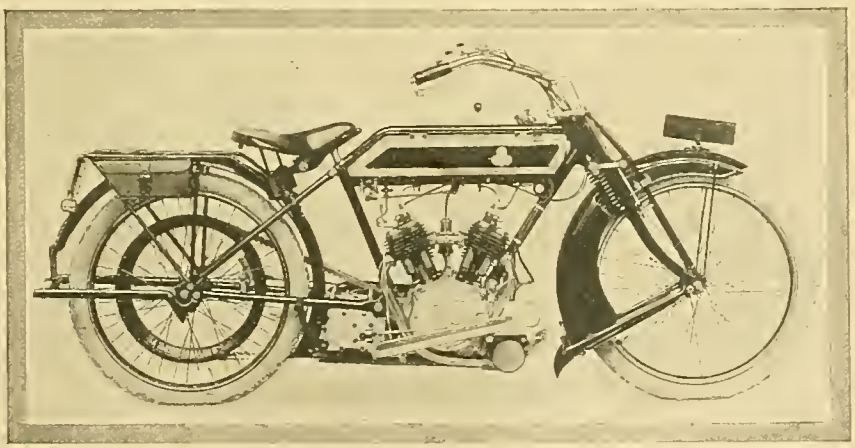


The simple gear quadrant of the Coventry Eagle. A sensible sump and petrol filler are fitted to the tank.

A Two-stroke Model.

In addition to this, a neat little two-stroke has been added to the list. The latest type of Villiers engine supplies the power to a Jardine two-speed gear box, the driving chain being neatly enclosed. The fittings, though on a lighter scale, correspond to those of the larger model. That is to say, that good mudguards, pannier tool bags, a pan saddle, comfortable footboards, and Brampton forks are all included, while a sight feed drip oil lubricator supplies oil to a point in the inlet pipe just short of the cylinder. The two-stroke may be obtained either single-geared or with a two-speed, and in the latter case the gear is controlled by a handle-bar lever.

The 3½ h.p. single has, of course, not been dropped, and forms a sound touring proposition for those who prefer the single-cylinder engine.

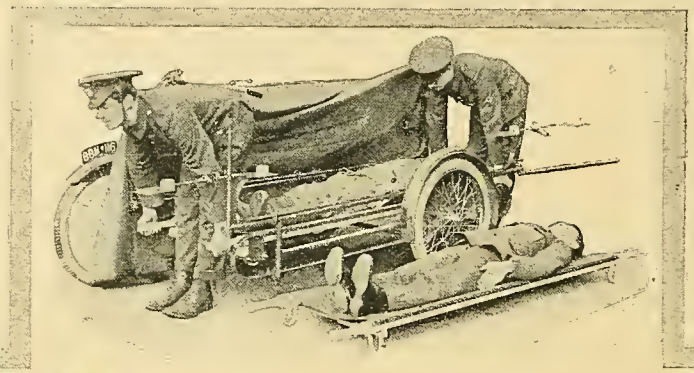


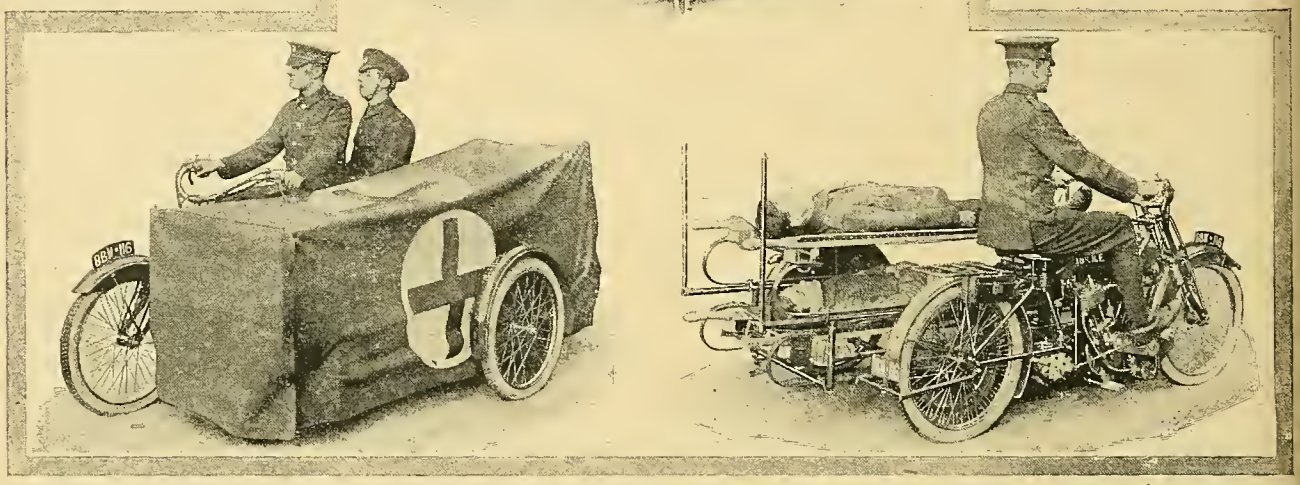
The 1915 model 5-6 h.p. Swift. (The specification of this machine was included in our Buyers' Guide of November 19th.) Its engine has a bore and stroke of 67 x 95 mm., capacity 670 c.c. A three-speed countershaft gear box is fitted and chain and belt transmission.

A Two-stretcher Sidecar Ambulance.

A NORTH-COUNTRY correspondent sends us photographs and particulars of a two-stretcher sidecar ambulance that has been adopted by the British Red Cross Society. This is, we believe, the first ambulance of its type built to convey two wounded men, and that it has been adopted by the Red Cross Society would seem to indicate that numbers will soon be in service on the Continent. The particular machine illustrated has been built at the South Benwell works of the Newcastle-upon-Tyne Motor Co., Ltd., a twin-cylinder 8 h.p. N.U.T. bicycle being utilised. This is fitted with a three-speed countershaft gear, and the tyres are 650 mm. × 75 mm. The ambulance portion, for which patents have been applied, is constructed of tubular framework, and so arranged that comfortable accommodation is found for two recumbent figures upon standard regulation army stretchers. The latter are supported on long springs, which run from end to end. For use in bad weather the stretchers can be all enclosed by a canvas cover.

There would appear to be decided possibilities in an ambulance of this type, and it is evident that it has certain advantages over the car type. For instance, its mobility is such that it can turn in a much shorter circle than a car can, but its great advantage is in its light weight. This applies to winter roads and boggy fields, where a sidecar ambulance would be able to go where a car could not





A two-stretcher sidecar ambulance that has been approved by the British Red Cross Society. The bicycle is an 8 h.p. N.U.T.

Clergymen as Drivers.

SIR FREDERICK TREVES in his report, submitted last week to the Executive Committee of the British Red Cross Society, makes the following statement: "A despatch rider on a motor cycle was pointed out to me. He was working with distinction at the Front, and had just come some sixty miles with a despatch. He was merely a bundle of rags, splashed with mud, and I was surprised to hear that he was a much-respected Church of England curate."

The Rev. E. P. Greenhill, vicar of Walton-on-the-Hill and chairman of the A.C.U. Competitions Committee, is shortly going to the Front as a motor ambulance driver.

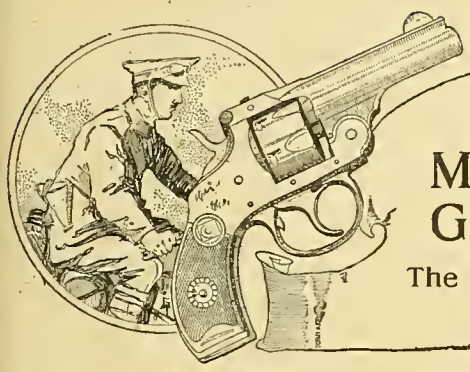
There are so many competition riders at the Front that it is not altogether surprising that many of them in writing home compare the roads met with to the courses of the big trials of the pre-war period. V. Underhill, a gold medal winner in the last A.C.U. Six Days Trial, suggests that the next "Six Days" should be held over what is at present the battle area, "as the roads are in a terrible state owing to our heavy transports, and that Mr. Loughborough works out the schedule at about six miles per hour. Under these conditions about 5% would gets golds."

W. Rope and Lance-Corporal Underhill, who are attached to No. 5 Motor Ambulance Convoy. The former was previously the competition manager of the Dunlop Rubber Co., and the latter was a gold medal winner in the last A.C.U. "Six Days."

A Prolonged and Trying Reliability Trial.

"We are having a prolonged reliability trial, and the way the motor transport, from the 2¾ h.p. bicycles to the 60 h.p. travelling workshops, is behaving on these vile roads is marvellous. . . . It will be necessary for the A.C.U. to find some new courses for its trials when the war is over, as anything which it has had up to the present is child's play. It is really extraordinary how the motor cyclists manage to ride at all; they are meeting with great praise on every hand."—Extracts from a letter received from Ernest Bass, formerly hon. secretary of the Essex Motor Club, and now driving a Wolseley motor ambulance attached to the 24th Field Ambulance, 8th Division.

We learn that F. A. McNab has received a commission in the Royal Naval Reserve, Motor Boat Service, and began his duties last week.



The Future Motor Cycle Machine Gun Battery.

The Possibilities for Further Development.

By H. MORTIMER BATTEN.

WILL the armed motor cyclist supersede the cavalry? Never, for the very obvious reason that cavalry can pass easily and quickly over country where it is impossible to take a self-propelled vehicle on wheels—through forests, over hedges and ditches, across swampy or boulder-strewn land, all of which are common obstacles in the pathway of warfare. But that the armoured motor cycle, whatever form it may take, will in future assist and support the cavalry, and will become an important item in the equipment of warfare, cannot be doubted.

Imagine the great possibilities of a small, fast, and easily handled vehicle mounting a quick-firing gun for short range work! Such an instrument of war, which could be secreted at every bend of the road or undulation of the landscape to pour forth its deadly and unexpected discharge, then rapidly retreat to safety, would be of value not only in proportion with its death-dealing properties, but on account of the harassing and nerve-shattering effect it would have upon hostile troops.

The machine gun is not readily mounted on the back of a horse, yet its value to a scouting force, not only for inflicting punishment on the scouts of the foe, but for defensive purposes, is clear at a glance. The cavalry often find themselves in the midst of hostile country, where they are dependent on their wits and the speed of their mounts for the fulfilment of their duties. The support that a quick-firing gun might give them, a gun mounted on a machine as fleet as a horse, capable of negotiating rotten roads, and, withal, infinitely more deadly than a rifle, is real enough to command our attention. Hostile cavalry could not face such a weapon, and, being small and consequently easy to conceal, it would pour forth its annihilating discharge and be away ere the surprised forces had properly grasped its whereabouts.

Urgent Necessity for Trade Action.

All this is granted; the possibilities of the sidecar battery have been forced upon us in this war with startling suddenness. We know that such machines, capable of taking care of themselves against heavy odds, ready for use at a moment's notice and while in rapid motion, would prove invaluable for scouting work, in covering retreats, and for individual sorties upon the enemy. We know also that to carry this war to a quick and successful issue prompt action on the part of all of us is needed. There is no time to hesitate and ponder, and it is fatal to say to ourselves: "We see now what will be required should war occur again. We shall be prepared."

The trade has already responded ably and quickly to the demands of the day, but as yet we are hardly awake. The motor cycle of warfare is still in its infancy. This war is not yet over; Lord Kitchener gives its probable period as three years; and manufacturers must not imagine that it is now too late to make preparations for turning out a new type of machine primarily intended for present conditions in Europe. Every available man is needed, but just as urgent and grave is the call of loyalty to those in a position to help the Army in other ways—to defend their own interests, apart from all natural sense of loyalty. The writer's appeal, then, is to the trade. We realise to-day what is needed, and whether or not the demand is met rests with the manufacturers, not with the Government.

That spirit of leaving all in the hands of the Government, of merely obeying its directions with little or no individual enterprise, is so painfully prominent in other directions that we do well to guard against it. The Government has realised the possibilities of the motor cycle and sidecar gun battery in the present war, and has done much to encourage its manufacture, but the perfecting of this new machine rests with the Trade, its future is in their hands.

I have already inferred that the motor cycle battery is still in its infancy, but let it not be thought that I cast any reflection upon the machines of this type now under course of construction. Their very existence proves that certain members of the Trade are wide awake, and one thinks that they will continue to hold a foremost place in the market they were the first to foresee. Yet it cannot be pretended that their machines, in the first few weeks of existence, have attained that standard of perfection with which the Trade and the War Office will rest content. In all probability the motor cycle battery will, if it receives the attention it deserves, finally assume a form quite different from the sidecar outfits now on the field.

What has already been done was done in a hurry. We were not prepared for this war; we had given not a single thought to the demands that a European struggle would throw upon us. When the guns began to boom, and the demands of the day were forced upon our startled senses, we gave the best we could offer. Our machines, excellent though they were, were not designed for warfare and the freakish conditions which they were suddenly called to face. Had we foreseen the war, we should have produced something quite different. In the same way, when the demand for sidecar batteries arose we had no

The Future Motor Cycle Machine Gun Battery.—

thought but to adapt the guns to ordinary touring machines, a practice which lacked nothing in ingenuity, though it cannot be expected to last. Excellent though these machines are, useful and effective though they will doubtless prove themselves, no one is more keenly aware than their designers that there is yet much to be done.

The situation is so urgent that it calls for further effort on the part of the Trade. The conditions on the field of war are so different from those met in the ordinary course of touring, and the part the motor cycle is to play is one of such importance, that we must consider every little detail of its construction if our machines are to show up to the best advantages possible. The ordinary touring machine leaves little to be desired for despatch work, but the motor cycle battery has opened up quite a new field, hitherto undreamt of, the importance of which we are not likely to over-estimate.

A Silent Machine Necessary.

Such a machine must be light, fast, and quick to handle, capable of accelerating with all possible speed, and of turning in almost its own length; good ground clearance, sufficient mudguard clearance, and silent running are important factors in the making of its efficiency. The latter point, silence of running, is one of the utmost importance. It must be remembered that the sidecar battery will be used for scouting work as well as in the firing line. In the latter case the roar of the exhaust will be sweet music compared with the bellowing discharge of the batteries, but in the former case the effectiveness of the machine and the safety of its riders may depend upon a silent approach. Therefore, if silence must mean loss of power, a cut-out of substantial design should be fitted, the closing of which entirely muffles the exhaust, even at the loss of power.

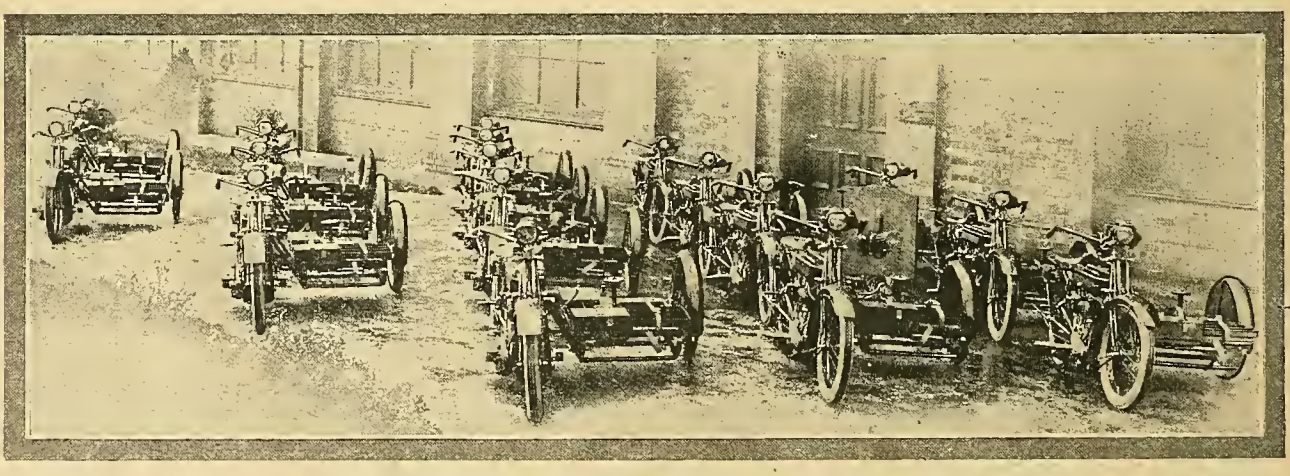
Again, it must be borne in mind that far more valuable than the machine itself are the lives of the men who handle it. Without them it is useless. These men may be exposed to very heavy fire at short range, and not only the gunner but the driver requires protection as he occupies his seat. It is said that a wound in the back is dishonourable, but this will not apply in the case of the motor cycle battery men. They will be there to fight and run away when occasion demands —to sprint into the corners of hell and out again. What would be the fate of the heroic gunner who stayed too long at his place to assure the safety of his comrades, and who, on retreating, was compelled to expose his body to the fire of the foe, cannot be doubted. He would be shot in the back "as safe as houses," and another useful instrument of war would be out of action.

Much of the effectiveness of the sidecar gun battery, then, depends upon its proper armament, and in this direction we are novices. Sheet steel will deflect a bullet that it will not stop, and if these machines are to fulfil all they are capable of fulfilling, they must be proof against rifle bullets. It is necessary that two men go with each machine to haul it in and out of cover, to assure quick handling of the gun, and to keep each other company.

Possibilities of the Tricar.

Personally, I am inclined to think that the old forecar arrangement might profitably be revived for the mounting of a light machine gun. It is low on the road, presents a small mark, and it could be armoured in such a way that the same shields would protect both rider and gunner, thus cutting down weight and wind resistance.

Though it is our main object to encourage a new type of machine specially designed and constructed for mounting a battery, we do not wish to discourage the practice of adapting touring machines for this special work, as such a system has two great points in its favour—cheapness and quickness of production. A trimo attachment for mounting a light machine gun might be made for adaptation to existing heavy-weight models, and such an attachment could be poured on to the market at much shorter notice than the properly equipped machine which it is our main object to encourage. When once the skilled pencil of the designer had overcome the initial difficulties, there would be no scarcity of riders and no scarcity of powerful mounts to meet the new demand. We want them by the hundred, and we want them at once.



SIDECARS FOR THE MACHINE GUN BATTERIES.

The first batch of Royal Enfield sidecar combinations for the new motor machine gun batteries. These machines have been allotted to the 5th Battery, the members of which are mainly Coventry motor cyclists.

MOTOR CYCLE RECORDS IN 1914.

The year 1914 has not been altogether unprolific of motor cycle records, there being considerable activity in the first six months, but naturally a slackening off in record attempts occurred after war began. From the list given below, which is compiled by the A.C.U. senior timekeeper, Mr. A. V. Ebblewhite, it will be noticed that several records were broken in the early part of the year. From April to July nothing very much was attempted, but on Saturday, July 25th, quite a number of records was broken at the B.M.C.R.C. meeting, some indeed which have not hitherto been published. Thereafter, though not at a standstill, Brooklands records have been fairly flat, only one or two racing motor cyclists having attempted record. The epidemic of record breaking, which is usually prevalent just before the Show, was naturally absent as no Show was held.

CLASS A.—For Motor Bicycles of which the Cylinder Capacity does not exceed 250 c.c.

Distance or Duration.	Date.	Rider.	Cyls.	Machine.	Bore and Stroke.	c.c.	Record.	Speed, M.P.H.
Flying km.	27/3/1914	H. Martin	1	Martin-Jap	76 × 54.5	247	44.6s.	50.16
Flying mile	27/3/1914	H. Martin	1	Martin-Jap	76 × 54.5	247	1m. 11.4s.	50.42
Flying 5 miles	27/3/1914	H. Martin	1	Martin-Jap	76 × 54.5	247	6m. 16.4s.	47.82
Standing 10 miles	27/3/1914	H. Martin	1	Martin-Jap	76 × 54.5	247	12m. 51.4s.	46.66

1915.

A Prosperous New Year to all our readers at home and abroad!

Thanks!

We have to acknowledge with thanks many Christmas and New Year cards from readers in all parts.

Police Traps—Burglars Busy.

Concurrent with the resumption of the police traps on the London Road and Bromley Common, the local press refers to a series of burglaries that the police are "investigating." One house, whose occupier is at the Front, was stripped of lead piping.

A Transmission Trouble

An amusing, yet annoying, experience befell S. Crawley, the Triumph rider, whilst driving a Morgan in the suburbs of Birmingham last week. In changing gear, the high gear chain snapped and fell in the roadway. A street urchin, quick as lightning, picked it up and ran up an entry before Crawley could stop his runabout! Despite a long delay, the owner had to give up his search for the miscreant and crawl home on the low gear. Chains are not cheap.

An Irish Club to "Carry On."

The Dublin and District M.C.C. held its annual dinner last week, the new president, Mr. G. A. M. Curtis, being in the chair. The first toasts were "The King" and "Absent Members Serving their Country." It was announced that the club had adopted "Carry On" as a motto, and that it was intended to run off as comprehensive a programme as heretofore. The prizes won in 1914 were presented during the evening.

Carburetter Control

There seems to be a tendency in motor cycle carburetter construction to extended use of the control of the jet opening. In some carburetters the jet is opened with the throttle by means of a tapered needle or a slide uncovering fresh jets; in others it is hand controlled, and again a combination of these two plans is possible. The opinion, however, of a well-known carburetter expert is that the first plan is the best, though his carburetters are made in both the first and last manner, for he says that the carburetter is better able to look after its own automaticity than ninety-nine riders out of every hundred, and that better consumption will be the result.

In Case of a Raid.

A correspondent tells us that all the metal plates on the milestones between Bromley and Sevenoaks were removed last week.

Despatch Rider Killed

The Times for December 23rd contained the following:

GRUBB.—Killed in action, November 15th 1914, whilst leading a charge, Second Lieutenant L. E. P. Grubb, Motor Cyclist Despatch Rider, 2nd Battalion King's Own Yorkshire Light Infantry. Born July 14th, 1892.

A. G. Cocks Released.

Thanks largely to the efforts of Mr. A. A. C. Swinton, president of the British Association Radio Telegraphic Investigation Committee, and Mr. Leverton Harris, M.P. for East Worcester, Archie G. Cocks was released from Hull Gaol on Christmas Eve. He called upon us on Monday, when we were able to congratulate him. It will be recalled that Cocks was sentenced to two months' imprisonment for having wireless apparatus on his premises at Filey, though he had duly advised the authorities and an official had removed the aerial and other parts. The apparatus was used in connection with the Boy Scout movement. Cocks was tuning up motor cycles for the Russian Government at the Clyno works at Wolverhampton at the time of his arrest. His release after two weeks in prison came as a surprise to him, though he had been treated with great consideration and had spent his time reading.

SPECIAL FEATURES

MOTOR CYCLE RECORDS IN 1914.
THE FUTURE MACHINE GUN BATTERY.
A DESPATCH RIDER'S DIFFICULTIES.

E. Kickham Starts a Business

The well-known Douglas expert, E. Kickham, has started a business of his own at 43, Stokes Croft, Bristol. He will make a speciality of supplying specially-tuned motor cycles and cycle cars. Naturally, Kickham's experience in work of this kind will stand him in good stead.

A.A. and M.U. Notes

IMPORTANT BRIDGE WARNING.—Norfolk Bridge, which is used by traffic on the lower road between Worthing and Shoreham, is in a very unsafe condition. Drivers must not exceed a speed of five miles per hour in crossing it, and two vehicles must not pass over the bridge at the same time, either following or passing each other.

Mr. and Mrs A. G. Cocks with 2½ h.p. New Imperial two-speed machines. The open frame machine is one of the first New Imperial ladies' machines to take the road. The photograph was taken on Monday last, a few days after the former's release. (See accompanying paragraph.)

To Manufacturers.

Mr. Philip Grout, secretary of the Motor Cyclist Reserve Committee, South Midland Division, 5, The Avenue, Keynsham, near Bristol, will be obliged if manufacturers of motor cycles will post to him their latest catalogues of motor cycles, together with price lists of spare parts, etc.

A T.T. Rider in France

Mr. Schulte, of the Triumph Cycle Co., has received a letter from Corporal Godfrey Boyton, R.E., who is now riding a Triumph in France. He speaks in glowing terms of the way his machine is running, and the only road stop he has had was when the mud forced the belt off the rim. Boyton may be remembered as the Irish amateur rider who put up such a good showing in the last Tourist Trophy race.

Canadian Statistics.

The official statistics of the provincial secretary of Ontario, relative to the number of motor cycle permits issued in the leading Canadian province, are highly interesting and instructive To November, the number of motor cycles licensed for the year 1914 was 3,806, with the prospect of a number of 1915 models being put into commission before the end of the year, which will add to the 1914 permits. Last year's total of registrations was 2,903. During 1912 the number of motor cycles registered totalled 1,754, while in 1911 less than nine hundred machines were in use in the province.

Rear Lights.

Not long ago we referred to an accident near Wakefield in which two sidecarists lost their lives owing to the absence of rear lights on a waggon. Another accident has occurred in the same neighbourhood; this time a motor car ran into a waggonette. The Coroner expressed the opinion that "all horse-driven or slow-moving vehicles of any description ought to carry a distinct and separate rear light." We agree.

The Inland Revenue Tax.

The advice of the Auto Cycle Union has been sought by a number of members as to the payment of the revenue tax for 1915 on their motor cycles or light cars, having regard to the fact that their machines will not be in use owing to the owners being away on service. So long as a motor vehicle is not used the owner is not liable to pay tax, but, the tax having been paid for this year, it will save troublesome enquiries on the part of the licensing authorities if owners or their responsible representatives will advise the authorities to whom they have previously paid the tax that it is not proposed to use the car or motor cycle. If possible this advice should be sent this year, and the further precaution might be taken of rendering the machine useless by removing the belt or even the tyres. In the event of the machine being used at some later date, the full annual revenue tax must be paid within twenty-one days until October 1st, after which date only half tax is payable.

A DESPATCH RIDER'S DIFFICULTIES

A despatch rider training for Continental road conditions. A recent snapshot taken on Salisbury Plain showing a Canadian motor cyclist charging through a large pool of liquid mud, and at the same time overtaking a heavy transport convoy belonging to the Canadian Contingent.

Canadian Competitions.

We are informed that the Calgary M.C.C. intends to hold a series of competitions during the coming year.

M.C.C. Members at the Front.

We have lately received the 1914 list of members winning awards in the M.C.C. competitions held this year. In this list there are no fewer than twenty-two who are serving with the Colours.

H.S.M. Machine on Police Duty.

We hear that two H.S.M. two-seated sidecars have been in use nightly for the past three months on special police duty in North London. The H.S.M., it may be recalled, has wheel steering, the driver sitting in the sidecar by the side of the passenger.

Hill-climbing in South Australia.

At a hill-climb in South Australia recently an Australian-built Lewis machine, fitted with a 3¾ h.p. overhead valve Precision engine, distinguished itself by doing the best performance both on time and formula. The hill is three miles in length, and the time taken was 5m. 5⅖s

Records in 1914

In this issue will be found a complete list of motor cycle records broken during 1914, compiled for *The Motor Cycle* by Mr. A. V. Ebblewhite, the official timekeeper to the A.C.U Whilst the first six months formed a busy half year, only one or two records have been beaten during the last six months.

Roads not Unrideable.

Lieutenant H. B. C. Pollard, now serving with the Intelligence Corps, writes from the Front: "The roads here are bad but not at all unrideable, except for shell holes. I am having a very sound time, and have met lots of men I sent out—they none of them bear any grudge."

Winter Trial in the West Country.

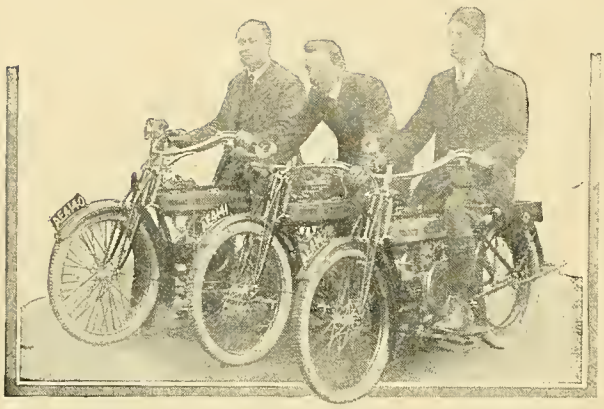
There is quite a good entry for the Bristol M.C.C. open twenty-four hour trial to Land's End and back, which starts to-morrow (Friday) evening. One of the new 4 h.p. Douglas sidecars has been entered; also, among others, two Triumphs, a Burford, A.J.S., Zenith, and Sunbeam; whilst the cycle car entries are also good. There is a team of Morgans, a Douglas, A.C., several G.N.'s, and a Victor.

A New Zealand Sidecar Trial.

The results of the Waikari (New Zealand) sidecar trial held on October 26th, are given below The trial was a most successful event, all the competitors finishing. It will be noticed that, though the only twin machine succeeded in winning, the single cylinders put up a fine performance. Results:

	Marks.
1. A. B. L. Smith (5-6 Clyno sc.) ...	150
2. W. Hollobon (4 Triumph sc.) ...	149.2
3. A. J. Harper (4 Triumph sc.) ...	147.4
4. M. S. Gentles (3½ Triumph sc.)...	143.5
5. C. Bonnington (4 Triumph sc.)...	139.7
6. W. Minson (4 Triumph sc.) ...	139.5
7. J. B. Merrett (3½ Rover sc.) ...	138.8
8. A. Summerfield (4 Triumph sc.)	118.0

CLUB NEWS.



A reminiscence of the last A.C.U. "Six Days." A recent photograph showing P. W. Moffat, W. B. Gibb, and P. Phillips, the Douglas team which won the team prize last July, when 597 marks were gained out of a possible 600. This is the first occasion on which the three successful riders have been photographed together. The trial machines had engines with a bore and stroke of 60 × 60 mm., and three-speed gears. Douglas machines are now distinguishing themselves in the hands of despatch riders at the front, a test which for all round severity puts A.C.U. "Six Days" and other similar events in the shade.

Leven and East Fife M.C.C.

The following is a complete list so far as is known of the members who are serving with the Colours. The hon. sec., Lieut. A. J. Carlow, will be glad to receive the names of any who may be unintentionally omitted:

A. Baird (private)
R. J. Braid (despatch rider)
And. Brown (despatch rider)
B. Bruce (despatch rider)
A. J. Carlow (lieutenant)
Peter Cameron (————)
R. Campbell (despatch rider)
K. Crabbe (volunteer despatch rider)
J. Christie (despatch rider)
W. E. Grosset (lieutenant)
P. Grosset (lieutenant)
T. Johnston (despatch rider)
W. Lawrence (————)
J. A. More (despatch rider)
J. Robertson (sergeant)
W. K. O. Shepherd (major)
J. O. Shepherd (Captain)
S. O. Shepherd (Captain)
W. Turnbull (despatch rider)
A. Wilson (despatch rider)

Bristol M.C.C.

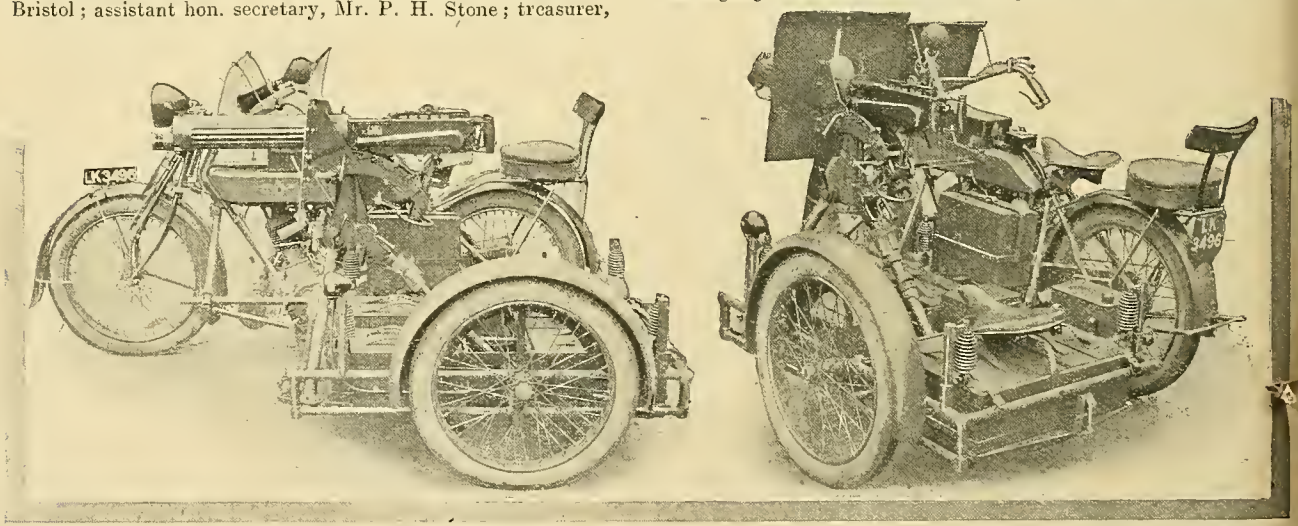
At the annual general meeting, held this month, the following officers were elected: President, Mr. Roderick Fry; captain, Mr. F. C. Wasley; hon. secretary, Mr. F. P. Davies, 8, Park View, Stoke Lane, Westbury-on-Trym, Bristol; assistant hon. secretary, Mr. P. H. Stone; treasurer, Mr. M. S P. King. The balance sheet, which showed a balance in hand of £94 7s. 3d., was presented by the treasurer, Mr. P. Grout.

Dublin and District M.C.C

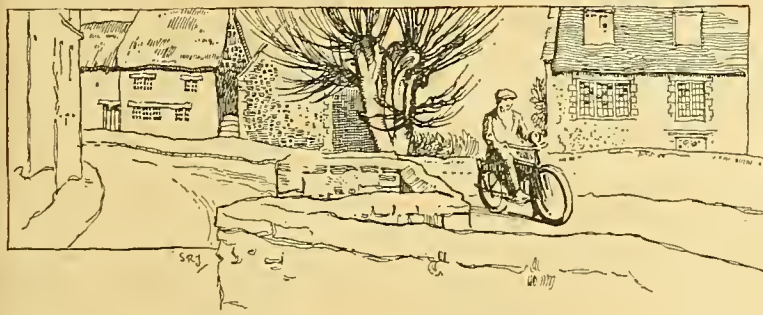
A non-stop reliability trial was held under the customary conditions on St. Stephen's day, the route being to Woodenbridge, Co. Wicklow, and back, a distance of eighty-eight miles. The weather was favourable, and the heavy rains on the previous day had washed the roads clear of mud. The holiday season had an effect on the entry, and still more on the starters, as only sixteen of those who entered put in an appearance at Donnybrook Bridge. Of these, several retired on the outward journey, and only ten checked in at Woodenbridge, of whom eight completed the journey, the following five making non-stop runs and being on time at the checking places:

A. W. Mooney (6 Bradbury sc.)
J. Healy (8 Matchless sc.)
G. Roche (3½ Rover sc.)
A. W. Kirkpatrick (6 Excelsior sc.)
T. E. Greene (3½ Rudge)

Many readers both at home and abroad have sent us seasonable greetings which, needless to say, we much appreciate. Special interest attaches to the card reproduced above, received from Mr. W. Williamson, in that it shows the new Williamson three-wheeler, which has been undergoing road tests for some months past.



The new 8 h.p. Matchless machine gun sidecar, particulars of which appear on page 721 of this issue. Points to be observed are: the protecting plates for driver and gun operator, and the third seat on the chassis of the sidecar; thus, if desired, three men can be carried. The gun and its tripod are mounted in such a way that it is only a matter of a few moments to remove the gun complete ready for action.



LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Infinitely Variable Gears on Chain-driven Machines.

Sir,—You might find the following of sufficient interest to merit further enquiry. About ten years ago I procured from the Bowden Brake Company the All Speed hub gear for pedal cycles. This worked on the sun and four planet system with an eccentric in the middle, and gave a rise of 50% from normal in infinite gradations. A heavier edition of the above could well be adapted to a motor cycle. No doubt the company can still furnish drawings.

Durban, Natal. C. D. WALES.

Clubs and Affiliation in War Time.

Sir,—With reference to your leader on club affiliation to the A.C.U. and their secretary's reply. Mr. Loughborough says that the A.C.U. is not run for profit but for the benefit of members and especially of clubs.

In my opinion the clubs who affiliate under the 5s. scheme should either get a better allowance than 6d. for new members or put up the subscription to 7s. 6d. to their direct touring members, so that they could allow the old fees (2s. per member). As things are now, clubs do their best to get members, and mention the A.C.U. benefits, etc., and the rider approached thinks about it and sends 5s. direct in a great many cases.

Another item that I have never seen yet is a balance sheet of the A.C.U. This, I consider, should be published each year, so that members may know how the Union stands. If the Union wants support from members and clubs, now is the time to show their standing, then, if the A.C.U. is not a paying concern, the members and clubs would not object to a small levy.

However, let us have the A.C.U. on a business footing and all members as shareholders. As things are at present, the Union is in the dark to all but a select few.

A. WILLIAMS, Secretary,
Leicester and District M.C.C.

A Clyno and sidecar with the British Expeditionary Force. The illustration does not convey a true notion of the amount of French and Belgian mud on both the bicycle and sidecar, but it is somewhat of an "eye-opener" to the road conditions at the Front.

Why an Engine Konks.

Sir,—I am very interested in the arguments brought forward *re* konking, and I look forward to your weekly issue with more interest than usual. I would like a word, although I am afraid I may add perhaps more mystery to the causes of konking.

I had a 3½ h.p. motor cycle that was a chronic konker, and when I approached a hill of any sort it used to strike up the anvil chorus *ff* and eventually stop, even after the ignition was fully retarded.

One day I had a fill up with benzole, and, strange to say, the machine would climb anything, and it was absolutely impossible to make it konk. So I cannot see where the arguments of piston clearance, loose bearings, and carbonisation come in. E. S. CHANDLER.

Sir,—In the correspondence in your paper on the above I have not yet seen any reference to the fact that it is almost unknown for an engine to konk when running on benzole.

Now the boiling point of benzolo is, in the 90% grade, from 80-100° C.; in Pratt's No. 1, for example, about 9% distils off below 53° C. It seems to me that when an engine is "labouring" the high degree of compression and temperature set up pre-ignition in this volatile part of petrol, or else with the spark well advanced this portion ignites with an explosive force. With benzole there is, of course, no light spirit, as it all distils at practically the same temperature, not being a mixture of hydrocarbons like petrol. L.B.H.

Sir,—The recent correspondence on "konking" has been of very great interest to me, as I have been a sufferer from this trouble for a long time. Mr. De Lissa's letter is of particular interest, and I can fully bear out the accuracy of his theory *re* the thinning of the film of oil by heating, and I quite agree with him that a real "konk" is always caused by the piston hitting the side of the cylinder; but my own experience proves that this is possible with a tight-fitting piston.

My engine is an inclined single, 475 c.c., low compression, long stroke, with top gear 5 to 1, used with sidecar and passenger always. Valve timing normal, magneto timing on the slow side, no play in the connecting rod bearings or main bearings, nothing to cause pre-ignition; everything has been most carefully and thoroughly overhauled and checked. At first the engine rarely "konked," and would take full air on hills. Then "konking" commenced on hills, and was stopped by giving less air. Then it began on the level, being audible as a faint rattle like the tappets on some machines; this was stopped by a richer mixture. There was about $\frac{1}{16}$in play between piston and cylinder, and the makers recommended reboring and a new piston. This was done, and the new piston was a tight fit: so much so that it would partially seize at full throttle for the first sixty miles or so. After running about 300 miles it is now quite free, but still a tight fit, and the knock has returned. It will always "konk" loudly on a hill if allowed to labour, and this can be stopped most efficiently by almost closing the extra air; but this causes a considerable loss of power. Retarding the ignition has the same effect, but causes still greater loss of power. As soon as the engine gets a little hot it starts knocking on the level, or even down hill, and this can be stopped until it is just a faint rattle by closing the air. When hot it is difficult entirely to stop this rattle.

I am quite sure the noise is in the cylinder, and am also sure the piston is a tight fit when cold. This brings me to my point: has it been proved that a cylinder, with its greater mass of metal, does not expand to a greater proportion than the piston? Another point is: does an offset cylinder have less tendency to "konk" than a centrally set one? Since the angle of the connecting rod with the piston will be less on the firing point, it seems to me that this should be so. A. MANN.

Artistic Appearance.

Sir,—I was rather surprised to read the remarks of your correspondent "Vulcan" in *The Motor Cycle* of the 17th inst., seemingly tending to advocate the "distorted tube" principle of frame design, more especially in view of the fact that in recent leading open competitions the judges and experts have publicly criticised the standard frame with its distorted tubing, and called for the "triangulating" principle to be more strictly adhered to.

It is fairly common knowledge that the average frame is in reality a push cycle frame altered (almost out of recognition now) to allow an engine, tank, etc., to be added, and that the present day motor cycle frame has become less of an engineering feat than even its forefather, notwithstanding the obvious necessity for a frame correctly designed for its particular purpose.

I believe the makers of the machine quoted by "Vulcan" use a special liner to strengthen their frame; but I would mention that I myself, with quite reasonable riding, have broken, in their "artistic" regions, at least two different makes of frame, the breakage usually occurring through slight elasticity, which eventually results in a fatigue fracture (commonly, though perhaps erroneously, termed "crystallisation").

Space does not permit an explanation here of the unquestionable superiority of a properly designed straight tube frame, but to help convince "Vulcan" of such, I would refer him to the first page or so of the Scott catalogue, and to that machine's successes in leading events. I have no connection with or interest in this firm whatever, but merely quote them as having very successfully departed from the usual practice.

Personally, I think it would have been far nearer the point had "Vulcan" pleaded for "harmonic appearance" rather than "artistic appearance." The latter is perhaps excellent in its place, but it should certainly not be allowed to interfere with an engineering proposition.

F. WILLOUGHBY COTTON.

Sir,—To motor cycle engineers who have for years made the subject of the perfect motor cycle their close and only study, and who *know* what they are doing all the time, having spared neither time nor expense to eradicate faults, improve design, etc., it is extremely disheartening and creates a sense of injustice to find in your columns a letter which is written by one who is palpably ignorant of even the elementary laws of mechanics. Such a letter is that appearing over the pseudonym of "Vulcan" in your issue of December 17th, the reference he makes to the trend of motor cycle design in the adoption of the sloping tube having obvious reference to, amongst other products, the A.J.S. 1915 models.

"Vulcan," in adversely criticising such a departure from a regrettable convention, is evidently quite unable to appreciate the fact that a curved tube cannot, when violently compressed, withstand the same forces which a straight tube will stand up to under similar treatment; consequently he deplores the innovation, and although no reader with a grasp of mechanics will suffer more than passing amusement from the perusal of such, "Vulcan's" letter will doubtless in turn be read by others equally in the dark as to the why and wherefore of frame construction, and, in this way, considerable unintentional harm may be done to those who are straining every nerve to give the best that knowledge can produce.

He also upholds the loop frame, whereas it is common knowledge that the triangular form of construction provides the maximum strength possible. The bottom loop, while inherently weak in design, admittedly enjoys reinforcement in the nature of a truss when the engine is fitted within it, but to uphold the latter method infers at least an equality in strength with that afforded by preserving as closely as possible an unbroken triangle—an entirely erroneous conclusion.

Certain firms still adhere to the loop frame, looking to the support and stay provided by the engine unit to secure sufficient rigidity, but others, and amongst them ourselves, have always striven so to preserve the triangular form that the perfection of design remains as little impaired as possible. Motor cycle design demands that the lower apex in such a frame be removed to provide the necessary room for the engine, and upon the method of building this into the apex depends the whole success or otherwise of the design. The scientific method employed in the A.J.S. machines virtually provides a replacement of this apex by the engine, so attached that any movement or "give" in any direction is impossible, even though the holding bolts at front or rear should be left slack.

In conclusion, however, we would point out to "Vulcan" that, beyond his general and individual bias in favour of curves in frame construction, the matter of straight *v.* curved top tube has otherwise no direct bearing on the question of the looped *v.* triangular frame, the two problems each carrying their own distinct series of considerations.

A. J. STEVENS AND CO. (1914), LTD.

Sir,—With reference to your letter from "Vulcan" in your issue of the 17th inst., I cannot help feeling that he views the subject from altogether the wrong standpoint. Where the lines of beauty diverge from the lines of mechanical efficiency it is clearly the duty of the engineer to follow the latter. In the early days of the last century there existed old beam engines supported on beautiful Corinthian pillars and other examples where the engineer tried to incorporate artistic effect into his designs. These ideas have become obsolete, and no one would wish their reintroduction, but to the engineer anything mechanically sound is beautiful, and it is clearly his duty to educate the public to this viewpoint.

The American curved down tube that "Vulcan" admires owes its existence, I believe, to the endeavour to protect the engine from boulders that are prevalent on outlying roads in those parts, but in England, fortunately, we have not this excuse.

My firm have for the last three shows advocated and shown the straight top tube, and are very pleased to see that fashion is at last adopting this, in all respects, admirable practice. It is my belief that in a few years' time public opinion will look back with wonder and amusement to some of the fantastic top tube designs that are welcomed as perfect practice to-day.

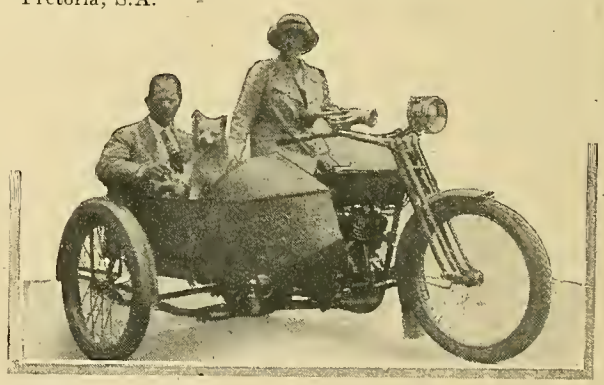
With regard to magnetos, many firms, including ourselves, can claim to satisfy your correspondent in his appeal for their position to be behind the engine.

THE WOOLER ENGINEERING CO., LTD.
JOHN HALL, Managing Director.

A Pretoria Lady Sidecarist.

Sir,—I enclose you a snapshot of two of your regular readers in S.A. The photograph is of my wife, self, and our dog, who will not be left behind on any of our trips. Mrs. Hill is the first lady sidecarist in Pretoria, and handles the outfit quite easily. We have five or six other ladies riding solo, and hope to increase their number in the near future. Wishing you the compliments of the season and every success in the future, SIDNEY L. HILL.

Pretoria, S.A.



Mr. and Mrs. S. L. Hill, of Pretoria, on their Harley-Davidson sidecar.

A DESPATCH RIDER'S DIFFICULTIES.

EXTRACTS FROM LETTERS HOME.

WE have previously published news from the Front sent by the brothers Rice. The following are further extracts from letters written by Bernard Rice during the latter half of November and the beginning of the present month.

"The cyclists are having a pretty rough time of it just now. The roads are fearfully treacherous, and, of course, there is more night riding now the days are so short. It is quite an eerie business that night riding. I had two nights running last week, a twenty-five miles run out each time at about 10 p.m., raining hard, roads inches deep in mud, and *pavé* almost impossible to keep upon. I arrived back about 3 a.m. the following day after being kept over an hour for my reply. (No extra charge for delivery!) It is very difficult to find the way on a strange road after dark, when one's vision is limited to the range of one's lamp. What we generally do is to take stock of the turns and twists of the road and all the junctions, and commit them to memory off the map. It is surprising how soon one learns to get about without being lost. The chief difficulty is that places get re-christened with an 'Englishified' name! The best of these is ——, which is known as —— ——! Very picturesque. [Deletions by censor.—ED.]

A Stubborn Resistance.

"It is very sad to see all the refugees plodding along the wet roads with their little all on their backs seeking friendly shelter, all with tales of woe and the barbarity of the Germans. It is these poor people who are the immediate sufferers of this war. Their houses are burnt down, their crops looted, villages shelled, and their churches despoiled and destroyed. It is, indeed, enough to drive them mad. That the Germans are catching it hot is certain, but they have such seemingly inexhaustible numbers, and such quantities of cannon, that I fear they will prove a very hard nut to crack. However, cracked they will be, and crushed, too, before long. . .

"Two phases of the campaign are over—one the march on Paris, the other the march on Calais. Both have failed, and the next move we may expect to be a defensive one—a stand on the Meuse. After the Meuse comes the Rhine. It is not likely the enemy will give in now, since either our terms must be crushing, or we fight again in, say, twenty years' time. What he is likely to do is to stubbornly resist us, and the Russians, in the hopes of straining us, and making us glad to conclude peace on easier terms. I should think May or June *might* see the end of it. . . .

A False Report.

"The cold started in November, when I was out on a long run, by sleeting hard. It then proceeded to snow, and after that to freeze, with the result that the roads are hard as nails, and riding is a pleasure once more. There are one or two drawbacks, of course. I found my lamp generator frozen solid last night, and, in spite of the new gloves and the new boots issued to me, feet and fingers will get numbed. . .

"We have heard here that the Kaiser has been shot by one of his own officers; whether it is true or not I don't know. All the French have it, and the signallers, too, so there may be something in it. If it is so, the end of the war is near.

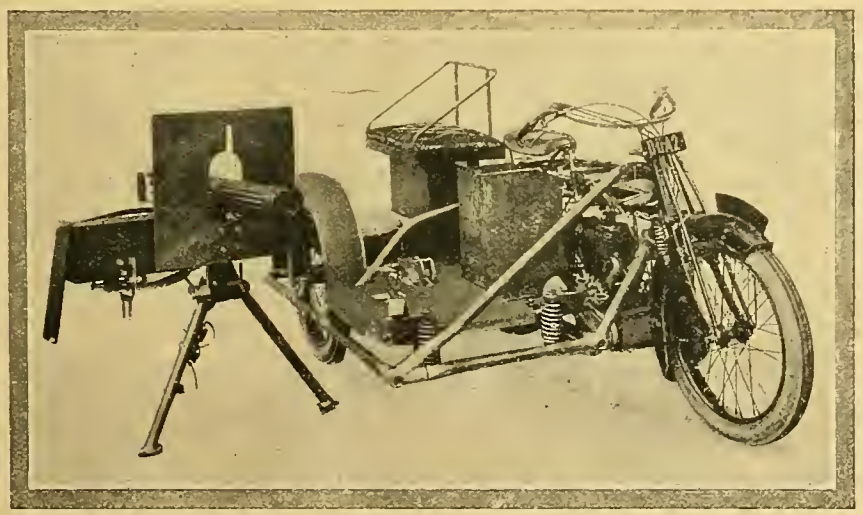
"We are, as you remark, sitting tight here at present. I am quite comfortable in a little grocer's shop, and there is an awfully nice kind little woman who cooks for me, and looks after me well. She owns the shop, has four little girls, and her husband is an infantryman at the Front. When possible, I 'mess' in with the family, and live top notch. Of course, they cook my rations heaps better than I do, so I score all round.

"I was down at the Indian Army Headquarters a few days ago and was much surprised, because every native I spoke to asked me if I had seen the Emperor. Of course, they were referring to the King. They were excited about his visit, too. I think he has done a lot of good out here, and his venturing across the Channel at such a time has impressed the French people very much.

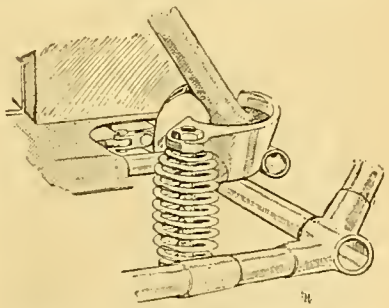
"All the troops that can be are in winter quarters now. That is to say, they are billeted in farms, barns, and villages. Those that are in the trenches are relieved every so often by others from the rear, but, in spite of care, there are many in the 'sick hospital' with chills, frost-bitten feet, etc.

"Our column is doing practically nothing now as regards supplying ammunition. The guns are using very little, and what they do use is taken up by the horse column, a branch corps of ours. It is better not to use heavy transport any more than is absolutely necessary just now while the roads are in this sodden state. We motor cyclists are still out on the brigades, and get several runs each per day, generally of a longer nature than hitherto since we are so scattered. However, we are all very happy and comfortable, some of us in private houses, others in farm buildings, and we meet occasionally.

"I was most interested to see Eddie's letter in *The Motor Cycle* of Nov. 19th. It is very rarely that we get a chance of seeing that most fascinating paper out here, and when it does appear it goes all round the column."



Vickers machine gun dismounted from the Premier sidecar, described in our last issue. It is a matter of less than ten seconds to remove completely the gun from its tripod. This vehicle was inspected by officers commanding the machine gun batteries last week.



Fixing of tripod for machine gun on the new Premier gun carriage.
(See accompanying illustration.)

G. C. Sambidge, hon. secretary of the Midland Light Car Club, is a lieutenant in the Royal Warwicks, which regiment is now in depot at Freshwater, I.O.W., for the winter.

B. Alan Hill, who is driving a car in the 4th Motor Ambulance Convoy, writes that he meets so many competition riders in France that it seems "quite like being at home."

Question & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A German Machine.

I am told by a friend that the N.S.U. motor cycle is made by a German firm; if so, kindly let me know, as I have a good chance of a bargain—a second-hand N.S.U. 6 h.p.—W.J.E.

Your friend is quite right. The machine you refer to is of German manufacture.

A Question of Spares.

I want to take up motor cycling. A local agent has a very good 2½ h.p. 1913 two-speed free engine F.N. Do you think, considering the factory where this machine is made is not working, and will probably be destroyed, that the risk of not getting spares would be too great if I bought the second-hand machine in question? Perhaps you may know what the F.N. Co. are doing, so as to be able to supply their customers with spares.—N.W.B.

There will be no difficulty whatever in obtaining spare parts for this machine, as the F.N. Co. are now busy manufacturing spare parts in this country.

Overhead Valves.

I think of purchasing a motor cycle with a 2¾ h.p. overhead valve J.A.P. engine. What are the advantages and disadvantages of this type of engine? In the case of a valve breaking, would it do any damage to other parts of the engine?—A.F.J.

Only racing engines of this type were built with overhead valves. Such an engine is perhaps slightly more efficient than those fitted with the ordinary type of side-by-side valve, but if a valve breaks the head often falls into the cylinder and smashes the piston.

Driving from the Sidecar.

I took up motor cycling some years ago as the result of a chance copy of your journal, and have had much pleasure from driving a sidecar combination since. Would you favour me with your opinion of tiller steering from the sidecar? It does not seem very popular, possibly because this method is dangerous.—G.W.

Steering by means of a tiller from the sidecar is quite possible, provided sufficient care is taken and the control transferred to the tiller, such as clutch, brake, throttle, etc. There is no danger, in fact, it is safer than riding with an empty sidecar, and it is very much more comfortable when a long journey has to be made solo.

London to Holyhead.

I intend motoring during the next few weeks from London to Holyhead. Owing to the conditions existing at present through war, etc., would I be wise to do this? Will you please give me a route, and mention some interesting places? I might add I have never been over this journey before. I am warned about the weather at this time of the year, by my friends, particularly so, as I intend to bring my sister.—A DUBLINER.

There is no reason why you should not motor from London to Holyhead at the present time, but, of course, one cannot tell what the weather will be like. It is best to start about nine o'clock in the morning, and finish up at lighting up time. Probably the most interesting route would be the following: London, Watford, Tring, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, Bromsgrove, Kidderminster, Bridgnorth, Much Wenlock, Shrewsbury, Chirk, Llangollen, Corwen, Bettws-y-Coed, Bangor, and Holyhead. The chief places of interest are Banbury, Stratford-on-Avon, Bridgnorth, Shrewsbury, and Llangollen. There is a very pretty drive from the latter place to Bangor. During the last part of the journey you will ascend to a considerable height, and if the weather is frosty, you may possibly meet a certain amount of snow.

B. Alan Hill, a familiar figure in the days of competitions and trials. He is shown by the side of a big Argyll ambulance which he is driving in France. We have published one or two letters from him during the past few weeks.

Erratic Running.

I have a 1914 Clyno and sidecar. I have done 6,000 miles, and lately have found that the carburetter gets so hot after running a few miles that I cannot bear my hand on it, while it works erratically. The engine is clean, and the inlet valves are working freely and accurately. The carburetter is an Amac semi-automatic. I have never been able to run slower than 15 20 m.p.h. on top gear. Could this be improved?—L.W.

There is no harm whatever in the carburetter being warm; in fact, this is generally an advantage. Probably the erratic running is due to too large a jet. It is possible, too, that it may be due to the ignition. You might try increasing the gap of the plug points. If the carburetter is properly adjusted you should be able to do a much slower speed than 15 m.p.h. on top gear. Look out for air leaks in the inlet pipe unions.

An Interesting Record.

Would it be too much to ask you to furnish me with the names of the winning machines and their riders in the Junior T.T. and Senior T.T. races since these were started?—W.O.F.

We give the results of the Tourist Trophy races since they first started in 1907. You will see that in 1907 and 1908 there were two classes—single and twin. In 1909 and 1910 there was only one class; and the Junior and Senior classification did not begin until 1911.

1907.—Singles: C. R. Collier (3½ Matchless).
Twin: H. R. Fowler (5 Norton).
1908.—Singles: J. Marshall (3½ Triumph).
Twin: H. Reed (5 Dot).
1909.—H. A. Collier (6 Matchless).
1910.—C. R. Collier (5 Matchless).
1911.—Junior: P. J. Evans (2¾ Humber)
Senior: O. C. Godfrey (3¾ Indian).
1912.—Junior: W. H. Bashall (2¾ Douglas).
Senior: F. A. Applebee (3½ Scott).
1913.—Junior: Hugh Mason (2¾ N.U.T.).
Senior: T. Wood (3¾ Scott).
1914.—Junior: E. Williams (2¾ A.J.S.).
Senior: C. G. Pullin (3½ Rudge).

The
achievements of
British airmen

in the present war have been so conspicuous as to call for special mention in despatches. In daring expeditions into the enemy's country, in reconnaissance work with the forces, their services have been of immense value. The illustration above depicts a section of the Royal Naval Flying Corps and a supply of

'SHELL'
MOTOR SPIRIT

which is being sent to the front for the exclusive use of the Allies in every branch of military service.

Insist upon having "Shell," the motor spirit the Allies use.

1915 and — the QUADRANT

Bearing in mind our oft-repeated claim—"There's no query about Quadrants"—we have, in the planning of our 1915 programme, cut out every element of doubt—

In short, there shall be "no query about Quadrants"—of that we are determined—let us convince you it is so.

In our extended range of 1915 models you will find—

The Quadrant 4¼ h.p. with B.S.A. Countershaft 3-speed Gear, Senspray Carburetter, Dunlop Tyres, Quadrant Engine, Quadrant Spring Forks, Pan-seat Saddle, and Aluminium Foot-boards—

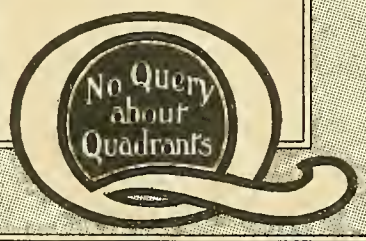
An exceptionally handsome mount supplied with either Chain-cum-belt or wholly chain transmission at the prices following—

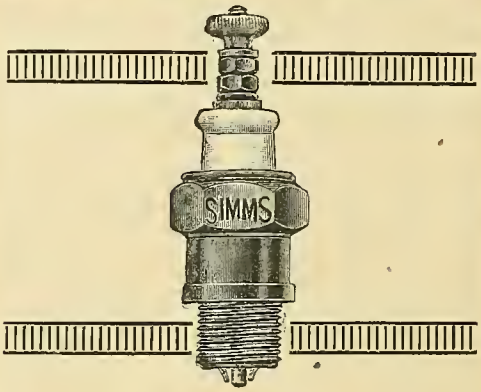
Chain-cum-belt Solo £55
Combination £66 11 0.
Chain transmission
Solo £57. Combination £68 11 0.

Let us send you details of the rest.

QUADRANT WORKS,
Lawley Street,
BIRMINGHAM

London Depot: 78, Gt. Queen Street, Kingsway.





Does your machine develop its full power?

SOME plugs, which to all seeming are quite good, prove to leak at high compression, and if you happen to have this kind on your engine you are not getting the full power out of your machine. If your motor cycle will not take you up every hill smoothly and swiftly, take out the spark plugs and fit the "New" Simms—the non-soot, rustless plugs which are gas-tight and never leak.

NEW SIMMS SPARK PLUGS

fire perfectly at all engine speeds, even at starting. You should give them a trial. Ask for the plug in the blue tin box.

PRICE EVERYWHERE EACH **3/6** TWIN POINTS OR SINGLE CONTACT.

Your magneto made like new.

¶ If your magneto shows signs of wear, or gives any trouble, send it to us and we will guarantee to make it like new. Furthermore, we will despatch it back to you within 24 hours of receipt. We repair all makes. Ask for an estimate, and you will see how reasonable are our charges.

¶ We keep a complete stock of "spare parts" for magnetos of every make, and can supply you per return. Call or write to:—

Simms Motor Units Ltd
191 Wardour St. Oxford St. London W

Makers of Simms 10/6 Vulcanizer.

E I.H.

Lowering the Compression.

I should be greatly obliged if you would answer a few questions that are troubling me. I may say that my machine is a 1911 T.T. Triumph, to which I often attach a sidecar, and, although I have no change-speed gear of any kind, I can get up all ordinary hills with a passenger, but I think I could do better if I reduced my compression. I do not want to fit an aluminium washer below the cylinder, as I like the high compression for solo work; besides it would mean altering the valve stems. Is it safe to fit a domed valve cap for sidecar work?—F.M.S.

The idea of fitting a domed valve cap is quite a good one, and we do not see why it should not be satisfactory and perfectly safe.

Finsbury Park to Exeter.

Would you please give me the best route from Finsbury Park, London, N., to Exeter *vid* Bournemouth, particularly the part through London?—J.F.

Probably the best way would be as follows: Finsbury Park, Seven Sisters Road, Camden Road, Albany Street, Marylebone Road, Oxford and Cambridge Terrace, Bayswater Road, Shepherd's Bush Road, Hammersmith, Hammersmith Bridge, Castelnau, Barnes, Roehampton; in Roehampton village turn right up Alton Road, first to the left, and last on the left again; this brings you on to the Portsmouth Road. The object of this detour is to avoid the police trap in Rochampton village. Continue through Kingston, Esher, Ripley, Guildford, Hog's Back, Farnham, Alton, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, Bournemouth, then proceeding through Wareham, Dorchester, Bridport, Lyme Regis, Colyford, Clyst St. Mary, to Exeter. The last part of this journey is hilly.

Acetylene Welding.

I have a 2¼ h.p. machine (new December, 1912), which I discovered last May had a tiny crack in the exhaust valve seating. Since then I have run it about 3,000 miles, but lately the engine has lost compression, and has been troubled with overheating. Otherwise, it has remarkable power, and the machine has been one of the best. Now what I want to know is, are the men who advertise the welding of broken valve seats any good? I do not want to go to the expense of a new cylinder for such a tiny flaw, so I wish you would give me your advice, as you may have had a similar repair. There are so many firms who appear to specialise in this particular work that I naturally hesitate before fitting a new cylinder.—E.L.

A skilful welder could probably make a job of your cylinder, but whether or not it would be entirely satisfactory is impossible for us to say, and can only be found out by submitting the actual cylinder to the expert to whom you apply to carry out the repair. The difficulty is not always so much one of carrying out the repair as trimming up the place mended afterwards. It usually leaves a rough joint, which it is very hard to get smooth again.

An Expanding Pulley Gear.

I am thinking of fitting as an emergency gear something after the style of the Gradua or Brampton expanding pulley. Will you let me know how it is that no jockey pulley is required, as I find my belt slips with ordinary pulley if there is much less slack in it than would be required to give anything like a useful range with one of the gears mentioned?—A.H.H.

In the case of the Gradua gear, the rear wheel slides back to take up the slack of the belt as the gear is operated. The Brampton pulley has radial grooves to prevent slipping.

Fixing Transfers.

I have two transfers for fixing on the tank of my motor cycle. Can you give me instructions as to how to do the job?—A.R.C.

The best way to fix transfers is to cover carefully the face of the transfer with a very small amount of gold size. Wait until the varnish is tacky, and then place on the tank. Leave this for a minute or so, and then carefully damp the back of the transfer, afterwards making it quite wet. You will now be able to remove the paper. Now wash off the gum with a sponge or soft rag, using plenty of water; then leave to dry. You can now varnish over the transfer if desired, but this is not always done.

SAUCER TRACK RACING IN CANADA.

A photograph taken during the last summer at the Toronto Motordrome, which is four laps to the mile. The crowd of spectators and the almost horizontal position of the four racing motor cyclists will be observed.

READER'S REPLY.

How to Remove the Cylinder.

In answer to the query of "J.P." in *The Motor Cycle* of December 10th, re the way to take off the cylinder of a 1910 Ariel. The motor cycle I had previous to my present mount was a 1911 Ariel, and when I had occasion to remove the cylinder I proceeded as follows: Remove exhaust pipe, plug, carburetter, and compression tap, and get piston at bottom of stroke; then lift cylinder off as far as possible (which position is just above gudgeon pin). Next carefully "spring" ring, which comes over ends of gudgeon, from slot, and slide it down the piston just sufficient to clear ends of gudgeon. Then gently push gudgeon pin out, when it will be found that piston and cylinder will come off quite easily. When putting it back into position, it is rather difficult to get gudgeon pin through, as the bush in connecting rod has to be in exact line with gudgeon pin bearings in piston. For this purpose I had a steel pin made the exact diameter of gudgeon with a taper end. This pin I placed in first to catch up connecting rod, and then followed through with the gudgeon pin. By the above method there is no occasion to remove engine.—STANLEY BRINTON.

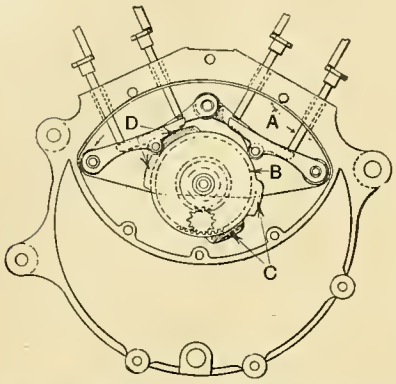
EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.C.Y." (Manchester).—8 h.p. countershaft Zenith for sidecar work. Durability of belts and general efficiency of gear and transmission.

Valve Operating Mechanism.

The rockers in a single or twin-cylinder engine are mounted on studs, which, instead of being screwed into the crank chamber as usual, are carried on a loose plate A, which is separately attached to the engine. It is proposed that this plate be capable of being moved around the camshaft to vary the timing.

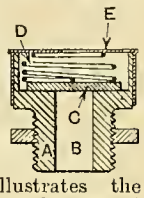


The cam runs at quarter engine speed, consisting of an internally-toothed gear wheel B with two sets of cams C and D arranged diametrically opposite one another, so that the gear wheel B is rotatively balanced.—G. Wray, No. 11,625, 1914.

PATENTS by Eric W. Walford

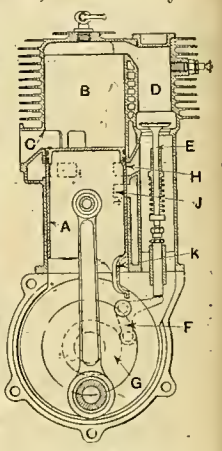
A Crank Case Release Valve.

Attached at any convenient point is the body A, having a central passage B, the end of which is normally closed by a disc C. This disc is retained over the passage by a spring D, and the end of the body is closed by a perforated cover plate E. The pressure in the crank case raises the disc C against the spring D, and the air escapes through the perforated cover plate. The specification also illustrates the application of this device to the end of a drilled crankshaft.—W. C. Urry and H Arthars, No. 21,981, 1913.



A Two-stroke Engine.

The sectional drawing illustrates the piston A at the bottom of its stroke. The cylinder B is formed with an exhaust port C on one side, and on the other has cast integral with it a cylindrical transfer passage D. The lower end of this passage is always open to the crank case, but is cut off from the combustion chamber by a mushroom valve E, which may be automatic, but in the case illustrated is shown as being mechanically operated by a bell crank lever F actuated by a cam G. In the side of the cylinder adjacent to the transfer passage D are found ports H and J. On the piston is formed a wall K, which provides a passage adapted to put the two ports H and J into communication when the piston is at the top of its stroke. The port J is in communication with the atmosphere, so that a supply of pure air reached the underside of the valve E. On this valve opening this air enters the transfer passage D, first scavenging this passage and the cylinder B. The charge of gas in the crank case then follows through the transfer passage. By this time the exhaust port is closed so that economical working results.—J. R. Kemp, No. 23,255, 1913.



Severn Belts for Military Work.

We are informed that the Severn Rubber Co., Ltd., have received a War Office order for belts for despatch riders' machines.

Hazlewoods in Manchester.

Messrs. L. F. Harvey and Co., 227, Deansgate, Manchester, have been appointed local agents for Hazlewood machines. They have new 1915 models on view.

Looking after their Warrior Comrades.

The employees of the Coventry Chain Co. have forwarded to each of their 140 comrades serving with the Colours a package containing one pair of socks, one handkerchief, tobacco, pipe, cigarettes, and chocolate.

A Satisfactory Balance Sheet.

The balance-sheet of the Palmer Tyre, Ltd., shows a profit for the year of £11,436 8s. 5d. Out of this the directors recommend a dividend of 12½% (free of income tax), and that £3,000 be carried to the reserve fund.

A Durable Belt.

A make of motor cycle belt, which has given us great satisfaction on two different machines, is the Pedley. Both these belts behaved in a most exemplary manner, having worn well and never having given trouble through slipping, even in the wettest weather.

Pratt's Spirit.

It is interesting to note that the Anglo-American Oil Co. applied for £200,000 of the War Loan, which amount has been paid for in full.

The retail prices of Pratt's motor spirit for practically the whole of England are: Pratt's Perfection, 1s. 9d. per gallon; Pratt's 2, 1s. 7d.; and Taxibus, 1s. 6d.

SPARKLETS

Palmer Tyres.

The Scott armoured motor cycles and sidecars in the service of H.M. Government are fitted with 2½in. Palmer cord tyres.

Christmas Cards.

Messrs. Raphael Tuck and Sons have sent us a specimen of a Christmas card (price 6d.) sold in aid of the National Relief Fund. This is a most artistic production, and should meet with a ready demand. It is a pity that in the picture, "Defenders of the Empire," the motor cyclist despatch rider, who has done so much for his country, is not represented.

War and the Tyres.

Most of us are finding it very necessary at the moment to effect little economies wherever and whenever possible. Those of our readers who are desirous of keeping the tyre bill down will find the retreading department of the County Chemical Co., Ltd., Bradford Street, Birmingham, a very useful institution just now. There are no doubt very many tyres which, whilst to all appearances worn out, have yet a good solid foundation, which, in the hands of a retreading expert, can be so manipulated as to be good for a few thousand more miles than would be otherwise possible. The Chemico people are prepared to advise tyre owners as to the best course to adopt when tyres are sent to them for inspection, and make no charge for such advice.

A Sensible Christmas Gift.

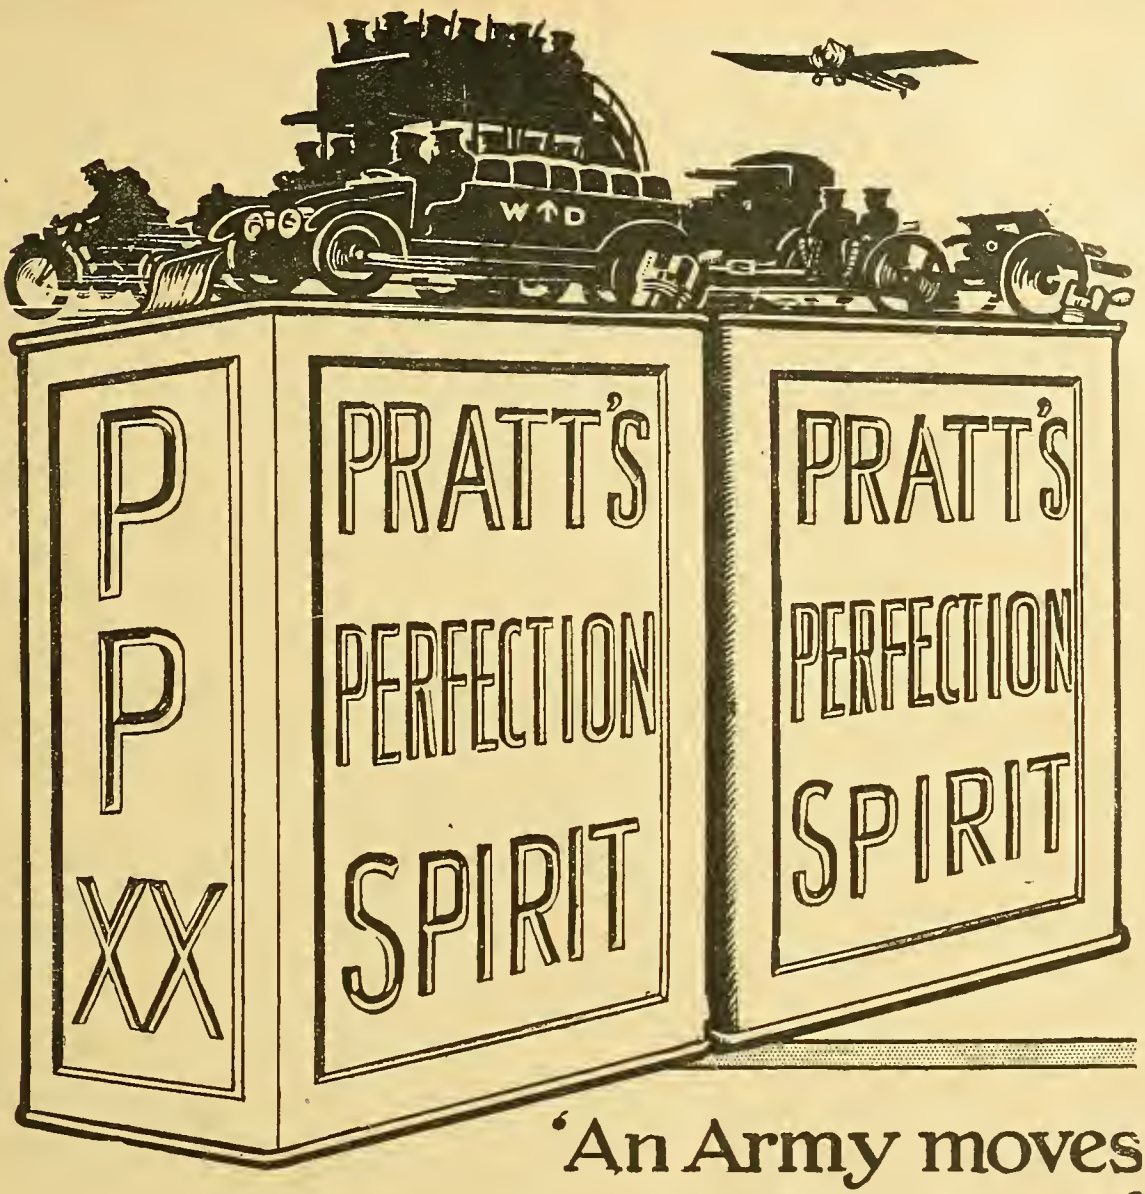
Mr. R. W. Coan, the well-known aluminium founder, does not spend the whole of his time in casting crank cases. For instance, this Christmas he produced a very handsome and artistic aluminium cover for a cigar box, and he will be happy to send one to any regular customer who has not already received one.

F.B. Two-stroke Engines.

The F.B. Two-stroke Co., 32, Coventry Road, Hay Mills, Birmingham, have decided to devote their energies to the manufacture of engines alone. It will be recalled that the F.B. two-stroke is already fitted to one or two different makes of machines, and the 1915 model, having a bore and stroke of 70 × 70 mm., is well spoken of. The firm has also introduced a new model of 63 × 84 mm. dimensions.

A Two-stroke on Active Service.

Sergt. W. F. A. Way, who is with the 2nd East Anglian Field Ambulance, writes: "My Royal Ruby two-stroke has given the utmost satisfaction and has been in constant use since war was declared without giving the slightest trouble in any way, it admirably withstands the exacting demands made upon it on service and runs as well as ever. For reliability it has beaten many higher-priced machines, although it has been valued at as much as fifty pounds, for which I consider all credit is due to the makers for the most excellent finish and appearance." There are a great many of these little Royal Rubys now serving with the army.



By Appointment.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

"EVANS"

—of John Bright St.,
BIRMINGHAM—

is a name to bear in mind when in need of the BEST in Motor Cycles. All the leading and most efficient machines of the day, including the **INDIAN** (for which I am the Sole Midland Agent), **A.J.S., JAMES, ENFIELD, TRIUMPH, ROVER, CLYNO, CALTHORPE,** etc., are stocked in all the newest

1915 MODELS

Before you buy elsewhere, call and inspect my stock. I guarantee to satisfy you in every direction—in selection, in quality, in price, and—in Payments. Will you call and "fix up" for Trial trip?

I still have a few Bargains in Second-hand and Shop-soiled Machines—ask for details.

P. J. EVANS

87, 89 & 91,
John Bright St., BIRMINGHAM

'Phone: Mid. 662. Wires: "Lytcar, B'ham."

In view of the excellent moral it is hoped that literary shortcomings will be overlooked.

I remember, I remember
(Thinking *all* adverts were "right"),
One fine morning in September,
Buying my first motor bike.

I remember being elated
At the seller's kindly mood—
Sorrowing, as he related
How his health was far from good.

Otherwise (he told me plainly)
I had failed to gain his prize;
So I paid my cash—insanely
Seeing truth in all his lies.

I remember, I remember
(For the motive power was "Me")
Running miles that hot September
With an engine ever free.

I remember endless troubles
(Once a truant gudgeon pin),
Crank-case leaking oily bubbles,
And—all sorts of funny things.

I remember asking sadly
How could I exchange my prize,
And the answer, given gladly,
"Go to Godfrey's, if you're wise."

Now I've got a lovely "Indian"
(And it romps up every "rise")
I shall buy a Godfrey's sidecar.
See what comes of being wise!

NEW 1914 MODELS IN STOCK.

£80 **HENDEE SPECIAL,** equipped with electric starter, electric head light, electric tail light, electric horn, Corbin-Brown rear drive speedometer, and magneto ignition.

About

that Belt.

A wire received from Mr. F. C. North, and dated 22/6/14, reads—

"Leicester Rubber Co., Ltd., Leicester. Full marks and GOLD MEDAL in

Scottish Six Days

on same JOHN BULL as used in T.T. Ariel, North."

Mark you—the same belt used throughout in the two severest tests of the 1914 season, and in both an entire absence of transmission trouble.

Could you have better proof of the merit and efficiency of the

JOHN BULL HEXAGON.

And the same belt was used by four other riders in the Scottish Trial—result, 3 Gold and 1 Silver Medals.

You should ask us for prices.

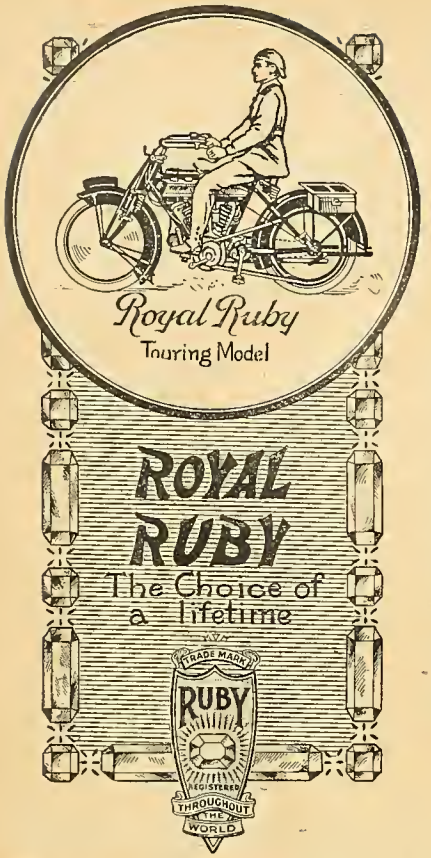
and 48, Holborn Viaduct, London, E.C. **Agents everywhere.**



ONE OF MANY REASONS WHY YOU SHOULD RIDE A ROYAL RUBY

Some people seem to think that all motor cyclists are of the same height and reach. We don't. The footrests on the Royal Ruby are adjustable in any direction, either as regards width of spread or height; they are quickly altered to suit the reach of any rider, and at the same time are perfectly secure. The Royal Ruby being built by practical motor cyclists is full of these little points—details perhaps small in themselves but which all go to make the perfect machine.

Model D. 3½-4 h.p., Single-cylinder	44 guineas.
Model E. 3½-4 h.p. Single-cylinder	47 guineas.
Model F. 3½-4 h.p., Tourist Trophy model	49 guineas.
Model G. 3 or 4 h.p., Twin-cylinder	52 guineas.
Model H. 6 or 8 h.p., Twin-cylinder	60 guineas.
Model I. 6 or 8 h.p., Twin-cylinder	80 guineas.

The Royal Ruby is fitted with: J.A.P. Engine, Druid or Saxon Spring Forks, Bowden Control, Chater Lea Hubs, B. & B. Carburettor, Brooks Saddle and Tool Bag, Dunlop, Hutchinson, or Palmer Tyres, Sturmey-Archer 3-speed Gear, Dunlop or Lyso Belts.

Write to-day for full specifications of the above magnificent touring models and also of the Royal Ruby Lightweight at 25 gns., or 2-speed model 31 gns.

THE ROYAL RUBY CYCLE CO.,

Ruby Works, Cannel St., Ancoats, Manchester.

STOMACH & BOWEL INDIGESTION

CAUSES

THAT BURNING SPOT BEHIND THE SHOULDER BLADE

With ACIDITY & DEPRESSION

COMPLETELY CURED

BY

CICFA

K. E., of Lewisham, writes: "I have intended writing you, but have been waiting to make sure I am cured. It is weeks now since I finished my second tube of Cicfa. I have taken none since, and I have had no return of the Indigestion in either Stomach or Bowel, so I can safely say I am cured. I shall always bless the day I wrote for your free sample. The second day of taking Cicfa I felt a trifle better, and now I feel ten years younger. Previous to taking Cicfa I was in such a bad state of depression and misery I used to wish I had courage enough to poison myself. I could not eat or drink anything and keep it down for long. I used to hate going out anywhere, as I had such an INTENSE BURNING PAIN BEHIND MY LEFT SHOULDER BLADE, and the acid would suddenly rise into my mouth and I would vomit. I often turned so giddy, too, that I would have to clutch anything near me, and in the morning getting out of bed I have fallen many times. I tried all sorts of things and all kinds of treatment, but I got into such a low state that nothing did me any good until I took Cicfa. I tell everyone I hear of having Indigestion how Cicfa cured me, and my advice to all Indigestion sufferers is: 'Don't wait and put it off, but get Cicfa at once and try for yourself.'

"Believe me, gratefully yours, K. E."

Read carefully, and you will understand why K.E., of Lewisham, feels so grateful. When death seems preferable to sufferings caused by Indigestion they must be hard to bear. That burning pain behind the left shoulder blade, that burning acid frequently rising in the throat, that giddiness so severe as to cause stumbling and even falling, and that profound depression and feeling of unutterable misery were all directly caused by Indigestion in Stomach and Bowel.

Nothing brought relief till Cicfa was taken, because there is no remedy except Cicfa which contains what Nature requires to ensure digestion of the food in both Stomach and Bowel. But Cicfa brought immediate relief, and very soon a complete cure. The reason is simple. It is this: Cicfa contains exactly what is needed to start digestion of all the Albuminous food such as eggs, meat, etc., in the Stomach, and also what is needed to immediately start digestion of all the Starchy food like bread, potatoes, beans, bananas, etc., in the Bowel, and also to cause digestion to continue till all the food is completely digested in both Stomach and Bowel.

The fact that over 7,500 British doctors have used Cicfa, and nearly 700 of them have written us of the splendid results they had obtained by either taking Cicfa themselves or prescribing it, is proof that Cicfa does not belong to the class of patent medicines, and is indeed a wonderful combination of digestive ferments.

READ WHAT DOCTORS SAY ABOUT CICFA

Dr. ——, M.R.C.S., L.R.C.P., Lond., writes: "I received the Cicfa tablets and as I am desirous of further proving their effect, I would be glad if you would send me a dozen glass tubes—containing 21—and if you will send account with same, I will forward cheque per return."

Dr. ——, B.A., M.D., writes: "I have found Cicfa so satisfactory that I have requested the local chemist to keep them in stock."

NOW READ WHAT THE PUBLIC SAY.

H.E., of Durham, writes: "I am delighted to say your wonderful Cicfa has cured me of indigestion. I have not known anything like it. I will certainly recommend it to all I know who suffer in the same way."

S.L., of Hull, writes: "I have found Cicfa all that you claim it to be, it not only relieves, but really cures indigestion."

Holidays are a Joy when Cicfa is taken BECAUSE travelling, visiting, or eating away from home causes Constipation. That is not the Liver, it is Bowel Indigestion. Cicfa is the only cure. Take Cicfa from the first meal, and enjoy your food and your trip.

Cicfa is sold everywhere price 1/1½ & 2/9.

If you suffer from Indigestion get Cicfa NOW, or TEST IT.

Judicious Advertising

in

THE MOTOR CYCLE

A prominent motor cycle trader gives striking evidence of the business creating power of this Journal.

May 4th, 1914.

Advertising Manager,
"THE MOTOR CYCLE."

Dear Sir,

As an advertiser in "The Motor Cycle" for over six years, it may be of interest for you to hear what results have been obtained.

For an expenditure of £230 per annum on advertisements in "The Motor Cycle," a working capital of £400 was made to produce a gross turnover of some £12,000 per annum, the original capital being turned over some thirty times in the year. These figures are facts should you care to make use of this letter, as it is always of interest to intending advertisers to learn what results can be obtained through judicious advertising in "The Motor Cycle."

Yours faithfully,

The name and address of the writer is being withheld by special request.

THE

E.I.C. 02 PLUG

ABSOLUTELY OIL PROOF.

NO PLUG has ever leaped into favour in so short a time as the now famous E.I.C. type 02.

For a few weeks we offered these Plugs at a special price to enable the public to test for themselves and prove to their own satisfaction that all our claims were sound and justifiable. The appreciation has been such that the demand has been far in excess of our most sanguine anticipations. We have literally received hundreds of letters of appreciation of their quality.

Every machine in T.T. Race fitted with these Plugs went through without Plug trouble. Every Plug carries with it our guarantee.

We have the right article and intend to place it on the market at the right price. Therefore, it will now be possible for the motoring public to purchase a really high-class plug of exceptional qualities at exceptional price - - -

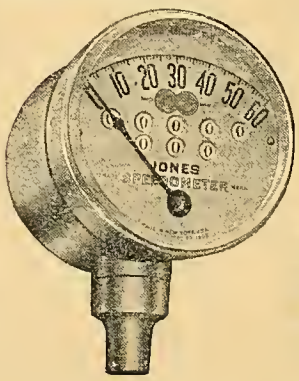
The JONES SPEEDOMETER

THE MOST DEPENDABLE— THE MOST ACCURATE— SPEEDOMETER IN THE WORLD

Jones Speedometers are constructed on the centrifugal gyroscopic principle, entirely unaffected by temperature changes or the proximity of magnetic or electrical devices. Its principle is that of a natural law, as unalterable as the law of gravity, and positively constant.



Every single instrument is individually calibrated by expert instrument makers and their accuracy is endorsed by the highest authorities the world over.

Prices from £3 3

Winner of the Highest Award and Gold Medal of the Royal Automobile Club in their ONLY OFFICIAL COMPETITIVE tests of Speedometers ever held in this COUNTRY.

Gold Medal also—Turin Exhibition.

MARKT & CO. (London), Ltd., 98-100, Clerkenwell Road———LONDON, E.C.

It's wonderful—

that in a trial that "conked out" so many motor cycles of twice and thrice its power—a trial where every day the "has beens" made quite a lengthy list—a trial among snow-clad peaks and over gradients and surfaces appalling—in short the

Scottish Six-Days—

that the only two competitors piloting the

CLYNO 2½ h.p. Lightweight

should "come up smiling" day by day, and finish with a record entitling them (provisionally) to the highest possible individual awards—

2 GOLD MEDALS.

It's wonderful—we say it, and if you will study the records of that trial you'll agree, and we think, at least, ask us for the booklet which describes "the Lightweight of Distinction"

Note also that the Clyno 5/6—THE Sidecar Motor Cycle—gained (provisionally) 5 Gold Medals in the same trial.

Rudge Multi

Supreme event of the Motor Cycling World.

Senior T.T. Race

Winner—

Rudge Multi

500 c.c., single-cylinder, air-cooled, belt drive,

with the

incomparable Rudge infinitely variable Multi Gear.

See *The Motor Cycle*, page 803, June 11th, 1914.

An Expert on the Rudge Multi.

"A positively superb engine." "An infinitely variable gear almost devoid of friction, easily holding its own in touring practice against designs with three or four arbitrary ratios."

The T.T. Races have given designers something to ponder. Both races were comfortably won by gears approaching the ideal of infinite variability. The Rudge Gear is of standard tourist type; and so far as present knowledge goes, the expanding pulley belt-driving gear are the only practicable designs of infinitely variable gear. Anybody who is well accustomed to the Rudge Gear knows that it is by far the pleasantest to drive in ordinary touring work with or without a sidecar; and also—this is important—the most reliable.

When I drive a three-speeded machine I am perpetually endeavouring to cling to one ratio or another, sometimes to hang on to top up a long slope, sometimes to rush a steep pitch on second; when I drive a Rudge this worry is subtracted from my task. I am able to suit my gearing to the load and gradient with precise accuracy. I am not tempted to let the engine labour; am not prejudiced against a change-down by the fact that such a change will import extra noise and friction, compel me to race my engine, and also to reduce my road speed beyond what is inevitable. The infinitely variable gear is unquestionably *facile princeps* alike for the pleasantness of driving, the speed of hill-climbing, intrinsic reliability, absence of friction, and its conquest of all temptation to man-handle the long-suffering engine.

In the past, infinitely variable gears have suffered from a severe handicap in that their emergency ratio was absurdly high, and that the belt was oppressed by the minimum of contract area in hill-climbing, when technical considerations demanded that it should have as large an engine pulley as possible. The Rudge-Multi has grappled with these handicaps ingeniously by devising a lightning belt-adjusting device, and has simultaneously utilised Brooklands to develop a positively superb engine. The Rudge engine is now so sturdy a puller that it does not need as low a gear ratio as some engines. So far back as 1911 I made a clean ascent of all the test hills which figured in the recent Light Car Trial, and also of all the famous Scottish Test Hills on a 500 c.c. Rudge with a bottom gear of 7½, and that a gear which was not infinitely variable, but embodied more friction than most modern hubs and counter-shafts. The 1914 Rudge Engine is at least 50% better, and its gear is now almost devoid of friction, and infinitely variable within wide margins. The chief lesson of the 1914 racers are that these infinitely variable gears are clamouring for more respectful recognition. They should easily hold their own in touring practice against all the designs based on three or four arbitrary ratios.

MARKT & CO. (LONDON), LTD., 98/100, Clerkenwell Rd., E.C.

TYRES.

LEGGATE, Edinburgh, for tyre value.

LEGGATE, Edinburgh.—For great reductions and genuine value in brand new clearance Cinchers, the tyre that is made by the largest indiarubber manufacturers in the British Empire, and famous the world over for quality, resiliency, durability, and non-skidding properties. Make the Clincher your safeguard.—See below for approval terms. Be assured of prompt despatch.

LEGGATE, Edinburgh. — Clearance.—1914 Clincher Dreadnought, very heavy, rubber studded, beaded covers, 26×2 30/-, list £2/4/6: 26×2¼ 32/6, list £2/7/3: 26×2½, to fit 2¼ rims, 32/6, list £2/7/3; 26×2½ 35/6, list £2/10/10. The Dreadnought is specially designed for passenger machines, is built of 6-ply fabric, and has a tread half an inch thick. An experienced sidecarist says: "Dreadnought is undoubtedly IT."

LEGGATE, Edinburgh.—Clearance.—1914 Clincher De Luxe heavy rubber studded, beaded covers: 24×2, 24/6; 26×2⅛, to fit 2¼ rims, 27/6, list £2/1; 26×2½, 29/6, list £2/2/9. A customer writes: "Have now run the 26×2⅛ 'De Luxe' tyre which I bought from you 6,895 miles on my Triumph, and the tread still looks quite fit for a considerable mileage yet It is the best value I have ever struck."

LEGGATE, Edinburgh.—Clearance.—1914 Clincher A Won, heavy rubber studded beaded covers, 26×2 21/-, list 31/6; 26×2¼ 23/-, list 34/-; 26×2½ 23/-, list £2/1/6.

LEGGATE, Edinburgh.—Clearance.—1914 Clincher sidecar covers, rubber studded, beaded edge, 26×2¼ and 26×2½. 16/-.

LEGGATE, Edinburgh.—Heavy tubes, brand new 26×2 6/6, 26×2¼ 6/6, 26×2⅛ 6/6, 26×2½ 7/-; list almost double.

LEGGATE, Edinburgh.—Above goods are all fresh stock, and sent anywhere on 7 days' approval against cash, which will be refunded in full if goods not approved of.

LEGGATE and Co., Motor Cycle Specialists, 15 Shuteford Rd., Edinburgh 'Phone: Central 3195 [X3335

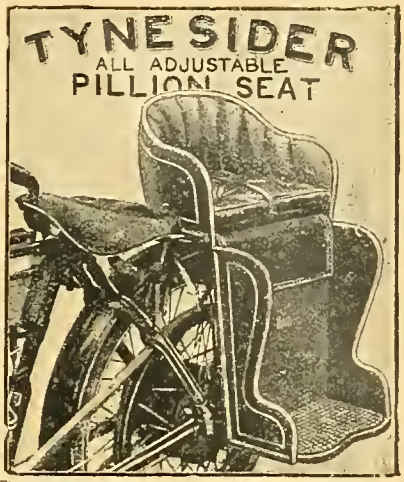
TYNESIDER ALL ADJUSTABLE PILLION SEAT



The **TYNESIDER** can be used as above illustration (on either side) also passenger facing back. The heel and foot board can be detached in two minutes and used tandem fashion or in four other positions. It can be swivelled any way user likes in a few minutes.

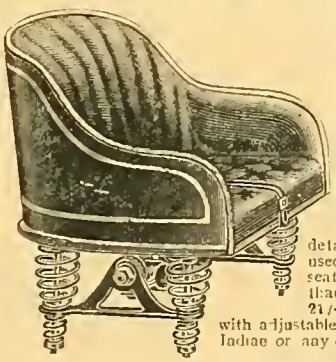
TYNESIDER SEAT is **COACHBUILT**, painted and lined as on a motor car, weighs about 11 lbs. We give you strength with lightness.

Can be used with sidecar combination, as extra seats for Two Seaters, Cycle Cars, etc. An ideal seat for lightweights.

Prices: **19/6, 25/6, 30/-** and **35/6**
Seat portion only, without heelboard, **15/6,**

complete with couplings, reversible cushion, strap, etc. The new patent **SPRING ATTACHMENT, 7/6** extra makes the seat self-balancing, absorbs the road shocks, and adds greatly to the safety of cantilever riding while the spring rods work in guides on the principle of a piston—thus preventing side-sway. Children's seats **14/6**, same as adults in miniature.

THE LAST WORD in MOTOR CYCLE SEATS.



The essence of comfort is the **Tynesider Bucket Seat.** Low position, surpasses pan seats, beautifully sprung, no sideways. Can be detached and used as a Pillion seat. Costs less than a saddle. **21/-** complete, with adjustable clip to fit ladies or any other cycle.

Without springs, **15/6.** Better quality, **27/6.** Superior quality, **36/6** complete.
Send for Catalogue and Testimonials.

STARTING UP MADE EASY

Trouble with the plug is invariably the reason for difficult starting up—the terminals have either become damaged and the space between them will not allow of an instant spark, or they have accumulated a deposit of carbon.

To obviate this very general fault you must fit the RUNBAKEN VARIABLE GAP PLUG. The terminals are variable and can be set close together to ensure quick starting, and then adjusted when the engine is still firing by turning cap. The RUNBAKEN never misfires, can be easily cleaned by simply turning electrode. Ignition can be shorted instantly. Ignition efficiency guaranteed.

Price 5/- each.

"THE DELUGE"

TRIPLE PROOF.

From all accessory dealers. Heavy untearable twill. Seatless overalls. The most durable and smartest suit procurable.

Reg. Design, 591,203.

PRICE 50/-

The following is an unsolicited letter of appreciation from a Motor Cycle Traveller.

Messrs. The Deluge Rainproof Clothing Co.

Dear Sirs—Re the Deluge Suit I had from you last winter, I write to say it's the best thing in Motor Cyclists' clothing I have ever had. Have used it in all weathers, practically every day, following my occupation as a Commercial Traveller, and have never had cause to grumble. Its neat appearance is one good point. Yours truly, (Signed) L. H. Hitching.

Makers
The Deluge Rainproof Clothing Co.,
52, Cannon Street, Manchester.

SPECIAL OFFER

TRY ONE

to introduce this new Challenge Plug. Send your old plug together with **1/3** and we will send you **one** post free. Only **one** will be sent to each rider. Others can be obtained from your local agent at **2/6** each.

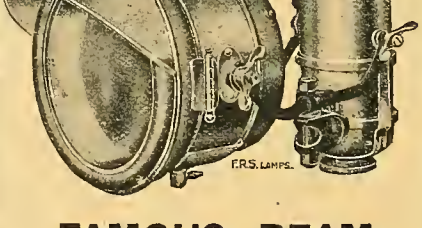
F.R.S.
LAMPS AND GENERATORS, HOLD WORLD'S RECORDS.



FAMOUS BEAM

Coupled with the F.R.S. Lamps is now known all over the world. **NO OTHER MAKE** can compare with it. It is dearer no doubt, but isn't it worth it? The best is always cheapest, and you positively **RIDE IN DAYLIGHT** through the night.

Lens.	Beam.	Price.
6 in.	1,200 ft.	72/6 and 78/6
5½ in.	1,000 ft.	62/6 and 68/6
4¾ in.	800 ft.	52/6 and 58/6

READ THIS.

To get the best you must pay well. We have made our name with quality alone, and we claim that our lamp is up to

90% more powerful

over any other make. Our lens is costly, and it is genuine. You will see what a costly mangin lens can do, if you try the light of the F.R.S. against any other.

F.R.S. Lamps, Pershore St., B'ham.

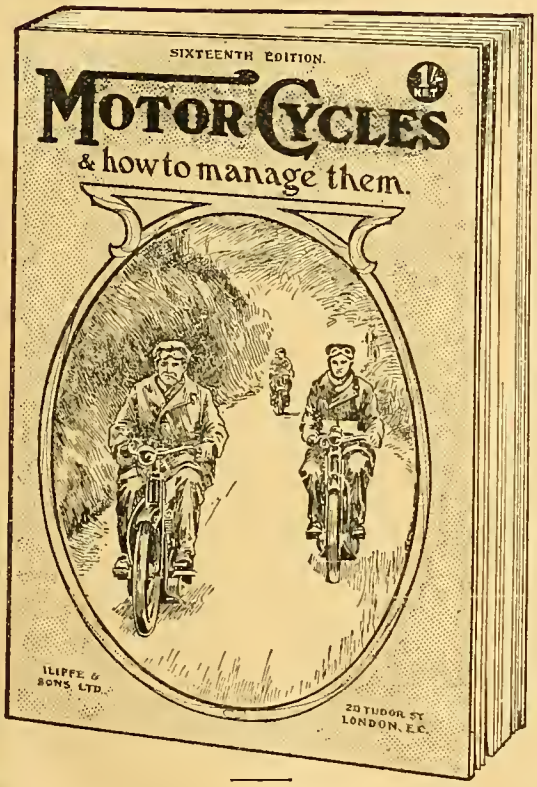
The Sixteenth Edition

of this Popular book on Motor Cycles.



Carefully revised throughout and brought up to date by the staff of "The Motor Cycle."

* * *

50 extra pages and nearly 100 new illustrations.

* * *

The chapters dealing with the Carburetter, Transmission and Gearing, have been greatly enlarged and are a most important feature of the edition.

"MOTOR CYCLES AND HOW TO MANAGE THEM" is unquestionably the best and most complete handbook on motor cycles, their care and management. The sixteenth edition (now on sale) is a great improvement on its predecessors, and will be found invaluable to beginners, and both useful and instructive to more experienced riders. It deals with a multitude of subjects relating to all types of motor cycles, and new matter is included dealing with cycle cars.

The buyer of a second-hand machine will find the book equally useful, as it describes old type carburetters, ignition systems, etc., in a special chapter on second-hand motor cycles.

Price 1/- net.

BEACON (Regd.) OILSKINS

NEVER GO STICKY OR LET IN THE WET.

Money back in full if this not so in any point

Authorities in every branch of Sport praise Beacon Oilskins. "**Ixion,**" of "**The Motor Cycle,**" says they are the only things which have kept him dry; "**Kuklos,**" of "**The Daily News and Leader,**" never rides without them; and they will give **you** the same sure freedom from weather-worries, though you ride all day against the cutting wind-driven rain and sleet.

Jacket and Leggings complete, in Black or Yellow oilskin **21/-**
In Tan or Grey-Green .. **25/-**
With seated trouser overalls in place of leggings, **29/-** *and* **35/-** *the suit respectively*

Send chest measure over jacket, jacket length, inside leg measure with remittance

ILLUSTRATED LIST POST FREE, showing Wet-Weather Wear for Motorists and Sidecarists. Send p.c. for it now

J. BARBOUR & SONS, Ltd., 26, Beacon Buildings, South Shields, England. (21)

Wintry Weather

generally demands a change to oil of lighter body to ensure easy starting, more efficient running, and less carbon deposit.

Huile De Luxe

Sole Mfrs.: Prices' Company Limited

merits special attention.

It is lighter than Motorine A; but it is richer in refined neutral fatty matter, and it is therefore equally efficient for "twins" for sidecar work. . . . .

BATTERSEA, LONDON, S.W.

"COOLIE" MOTOR CYCLE OIL

(CHEMICO BRAND)

The following testimony from a well-known mechanical writer on the Trade Press is absolutely incontestable:

Mr. Chas. Lake,
"Motor Cycle and Cycle Trader,"
"The Motor Trader," etc., writes:

"THE 'COOLIE' OIL which I used on the Rudge 5-6 h.p. engine PROVED EXCELLENT and what I particularly noticed was the ABSENCE OF GUMMING-UP OF THE CYLINDER AND PISTON HEADS.

"Although we have had some very cold weather, I HAVE EXPERIENCED NO DIFFICULTY IN STARTING. The lubricating qualities are evidently first-class, as THE ENGINE SEEMED TO DEMAND LESS FREQUENTLY OILING THAN PREVIOUSLY."

No words of ours could add to the value of such testimony.

You can probably obtain this oil from the Stockist in your district; but if you cannot, DO NOT DO WITHOUT IT. We will send direct, carriage paid.

Quarts, 1/9 Half Gallons, 2/9
Gallons, 5/-
